In his introductory remarks he referred to the fact that during the year they had lost by death 17 Fellows, including Ewan Christian, a past president, J. P. St. Aubyn, and Henry Clutton, of Hartswood, all of whom had been identified with the Institute during the whole course of its corporate existence. They had also to mourn the demise of E. G. Paley, of Lancaster, and two of their examiners, Ernest Turner and Harry Drinkwater, as well as Gordon M. Hills, the well-known archæologist, and Herbert Gribble, the architect of Brompton Oratory, and also Dr. Reichenspergen, of Cologne, and Richard Morris Hunt, of New York. The President also referred to the new London Building Act, which had come into force this year, and added that the current year had also witnessed at its commencement an important development in the examination system. Every fresh applicant for admission to the class of associates had now to ascend three stages of progression before he could pass as qualified for candidature. He had first to be admitted a probationer, then a student, then a candidate; and this required a minimum period of five years to accomplish. True, there were special facilities for architects in practice and chief assistants to enter for the single final examination; but, for all youths entering the profession, the three grades had to be successfully attained before an applicant could submit himself for election as Associate. The current year had also witnessed a revival of the Architects' Registration Bill; its attempted passage through Parliament had been opposed by the Institute, involving an expenditure of labour and of money which it was ill prepared to meet. What he proposed to say might be divided into two main heads—first, the treatment of architects by the public; and, secondly, the relations and services of the Institution to the profession and to the public. The President continued: There seems to be an impression abroad, and one very unfavourable to our profession, that the services of an architect are not required unless a building is to be of an ornamental character, and that when an architect is called in it must necessarily be more costly than in those cases where he can be dispensed with. We all know that that is a great mistake; but it would be mutually advantageous to the public and ourselves if it were realised that the well-ordered plan elaborated by a skilful architect must necessarily be economical in many ways, and if some initial expense has to be incurred by his insisting on sufficient solidity and good material, it is very soon recouped, and over and over again saved in the repair bill. If the employer asks for a building without ornament, the true architect will make no objection; he will know how to produce a good and comely, or even a stately, building without it. One of the greatest satisfactions that an architect can feel is when the ultimate cost of a building is kept very closely to the first estimates. When this has not happened it may very frequently be traced to a want of proper confidence shown to the architect at the outset. The employer supposes that it will promote economy if he names at first a smaller amount than he is prepared to spend. To this the architect adapts his design, and the work is commenced; but as it proceeds, the employer, or perhaps his wife, demands additional size or other modifications, which can only be introduced at a greater cost than would have been the case if they could have been embodied in the original design. Something of this kind can also have arisen from the work having been commenced in too great a hurry by the urgency of the employer, owing to his ignorance of the time required for the due elaboration of the design. Much time and much subsequent worry might frequently have been avoided by a few weeks', or even days', free intercommunication before the design was put into execution. In communications between architects and the district surveyors in London the latter are found almost invariably just and courteous; but in many provincial centres the local Acts and bylaws are administered under surveyors who have often had no architectural training whatever. Architects who may be practising in those places are frequently much harassed, and interfered with in an unwarrantable manner, even to the extent of the builder being ordered to alter parts of the work without any reference to the architect. Public or municipal buildings seem to offer the most frequent occasions for interference with the legitimate position of architects. The most unsatisfactory relationships between architects and employers are apt to arise in the arrangements connected with architectural competitions. That the competing architects are not unfrequently themselves to blame for part of this has often, and not unjustly, been said; but much of it is caused by the promoters of competitions, who ought to consider more than they are apt to do what is due to the profession. It is already a favourable sign that in very many recent competitions professional assessors have been appointed; but there has been in too many instances a want of proper consideration shown to the assessor's award. On the subject of architectural competitions in general, my immediate predecessor in this chair, Mr. MacVicar Anderson, has argued with great force that the principle of these competitions is altogether wrong, and beneficial neither to architects nor to the public. This statement, however, with respect to the former, perfectly true as it is, may not be quite so convincing to all of us as to the public; because, whether rightly or wrongly, young aspiring architects probably do think that from competitions, whether they are successful or not, they get an opportunity of advertising their powers. But as regards the public, it appears to me that Mr. MacVicar Anderson's argument is solid all round, namely, that a competition is not the way to get the best architectural result. An architect's best work cannot be brought out by competition. He must be serving two masters —one that which is best in the abstract, and the other that which is most likely to please the promoters, who often are very incompetent persons. It may be said by some that the spur of competition is useful in exciting genius; but a far healthier stimulant is the wish that a building which may have been intrusted to his hands shall redound to his credit. This is the true and only competition that ought to be encouraged. Then as to the bearing of the question with respect to our profession, my attention has been drawn by a friend to the case of the recent competition at West Ham. "Here," he writes, "75 designs were sent in for a building to cost £40,000. One man would get properly remunerated, two others get small inadequate premiums, and the remaining 72 will have lost all the time and money spent. At the ordinary professional charge for sketches only—viz., 1 per cent.—the amount would have been £400 for each of the designs, so that at this rate the cost of professional labour has been nearly three-fourths of the cost of erecting the building. Surely this must be a great loss to the profession as a whole, and the great majority of the competitors might have been better employed and more profitably. Business men have frequently expressed the utmost astonishment at this wasteful system." Another point which ought to be considered as exercising a very unfavourable effect upon architects who engage in competitions is the severe mental strain to which even a successful competitor must be subjected in compressing his work into too short a space of time. There is nothing in other liberal professions at all analogous to our architectural competitions, and they certainly do not raise architects in public estimation, particularly in the way in which they are so often conducted now. The practice has become so general that I cannot flatter myself it can be arrested; but it may be improved. Instead of resorting to competition, a far better plan for promoters would be to discuss among themselves and settle who the architect should be for any particular work. Committees of promoters who think they are securing the best result by eliciting, as they seem to expect, happy inspirations from a number of different minds and choosing the best of them—which by no means follows as a matter of course —go a very wrong way to work. Again, if there be any occasions when competitions are more undesirable than others, it is in cases where adaptations are to be made to existing buildings. In connection with the system already become so fashionable, which will be applicable both to open competitions and to those that may be restricted to a limited number, looking at the matter as much as possible from outside the profession, I would urge competitors to take the advice given from this chair by Mr. Waterhouse in his address to students in January, 1889—namely, that when unfair or obviously misleading conditions of competitions are issued by a promoter, the duty owed to the profession is to make no response. In short, Answer him not. Unfair conditions are not always—indeed, are not generally—the outcome of unfair or ungenerous feeling on the part of promoters; for their often objectionable clauses competing architects are much to be blamed. At various times architects have competed when they ought to have declined, and have thus led promoters to think that they will get a sufficient response under almost any circumstances. In many cases the authority of the assessor is reduced to the lowest possible degree, and in such instances architects ought to decline to compete. Mr. Penrose quoted in illustration the conditions of a recent competition, under which the committee might, by a majority of one, in consideration of the premium offered, impound the plans and put them into the hands of a clerk of works to execute! Surely in vain the net is spread in the sight of any bird, said the wisest of men; but he evidently had not reckoned for an architectural competition! In another case, however, for which the preliminary proposals had just been issued, the new clauses formed an agreeable contrast with those he had quoted—viz.: (1) The President of the R I.B.A. to nominate an assessor. (2) The assessor shall draw up the conditions of the competition, and, in giving his award, shall state in writing his reasons for doing so. All the competition designs shall, with the consent of their authors, be publicly exhibited after the award has been given. (3) The design awarded the first place by the assessor shall be the design adopted, unless it should be found that a majority of not less than three-fourths of the entire committee are in favour of any other of the competing designs, which in the latter case shall be adopted. Mr. Penrose continued: We are all convinced that no response ought to be made to an invitation issued for any competition, unless there be a professional assessor appointed; and it is self-evident that such assessor ought to be a man of high standing, and free from any local interest. But, with this exception, rather different views appear to be held respecting the degree of authority with which he ought to be invested in regard to the appointment of the architect to carry out the works after he has given his award. There is one thing, however, of extreme importance—namely, that he should not be called in, as is too often the case, when a number of designs have been sent in in answer to the unassisted invitation of the promoters, but that he should himself take the leading part in the preparation of the conditions and instructions. When this is done, promoters may be saved from making many mistakes. A very misleading error they often make is to give out a statement of their desiderata, and proceed to state a limit of cost, which are frequently quite incompatible with each other. Hence arises a source of very great perplexity both to the competitors and to an assessor appointed after the designs have been sent in, the latter finding it impossible to adjust the two irreconcilable views. There is, however, an objection of some weight, though not comparable with the absence of professional direction, in the drawing-up of conditions, that if the assessor is known beforehand, the competitors will be more or less influenced in their designs by the study of his known, or supposed, architectural bias; and this is perhaps the reason why the assessor has so often been only called in at the last moment, when all the mischief introduced by careless and misleading rules has been done. It is, however, a difficulty which, when thought of sufficient consequence, could be avoided by various means. Returning to the question as to the amount of authority which ought to be given to an assessor, he should not be merely allowed to recommend a certain course of action to the committee of promoters, but his position should be made predominant. As, however, the promoters can hardly be expected entirely to give up their control of the decision, I gladly endorse the condition already quoted, that the assessor shall have the duty of nominating the architect, unless his selection shall be challenged by three-quarters of the whole committee; and such a clause as this would satisfy our expectations, which several recent repudiations of the assessor's award have seriously disappointed. The course which appears to me to be the most desirable, and which coincides with the opinion of several highly-experienced assessors, forms one of the Suggestions printed in our *Kalendar*—namely, "That the promoters should, by advertisement, invite architects willing to compete for the intended work to send in their names by a given day, with such other information as the candidate may think likely to advance his claim to be admitted to the competition. From these names the promoters, with the advice of the assessor or assessors, should select (*a*)" [and this I hold to be the better course] "an architect to carry out the work, or (*b*) a limited number to compete, and each competitor thus selected should receive a specified sum for the preparation of his design. The author of the design awarded the first place should be employed to carry out the work." And to this might be added a very desirable suggestion, that some proper remuneration should be given to the architect selected if the work should not be carried out under his superintendence within some reasonable time. In regard to the second point alluded to at the outset—the relations of the Institute, the profession, and the public—the President remarked that, in the extremely able address that Mr. T. G. Jackson, A.R A., lately gave at the opening of the Liverpool School of Architecture, he spoke of the rise throughout the land of technical schools and institutes. Nothing, indeed, could serve to encourage those who had laboured in the cause of education for architects and handicraftsmen more than the foundation of the Liverpool School, under the combined auspices of that city and of Victoria University; and he saw no reason why, after efforts similar to those which had resulted in success at Liverpool, other important cities in the United Kingdom, such as Edinburgh, Dublin, Manchester, Bristol, Oxford, and Cambridge, should not found or develop a like school, and a like professional chair of architecture. There was a matter very seriously affecting those whose daily duties lay with *pondere, numera, et mensura*, to which he thought it might not be out of place to refer. Not long since the Parliamentary committee appointed to consider the national standards reported in favour of our adoption of the metric system. The change would no doubt introduce certain far from unmixed advantages, but it would be attended with enormous trouble not to be got over for many years. He ventured to take that opportunity of bringing before the Institute an alternative which he could not but think worthy of consideration. Instead of swallowing the metric system as a whole, what he ventured to recommend would give to our commercial classes all that they could properly ask for, and to themselves and the millions of the industrial classes all the advantages which could arise from the metric system, with less than one-tenth of the disturbance. The scheme involved a very insignificant change in our own reckonings of length, weight, and capacity to render the English standards easily commensurable with the French. He would confine himself that evening to the measurements of length. "If our inch were," he said, "reduced in length by about one hair's breadth, ten such inches would be 25 centimètres, a measure which is current in Italy, the palmo having been altered so as to agree with the quarter of the mètre. I would therefore recommend the word palm to be used to denote a length of 10in., thus serving for general use instead of the foot, and giving us at the same time a decimal notation, whilst all small dimensions could be reckoned, as now, in inches, halves, quarters, and eighths, or decimals of the inch at pleasure. In our dealings with those nations that have adopted the mètre it would be only necessary to multiply or divide by four, as the case might be—that is, divide a measurement given in mètres and centimètres by four to bring it to English palms and inches, or multiply English palms and inches by four to bring them to the metrical scale. The slight alteration in the inch would not be felt in the dealing of our poorer classes, who are really the persons, both numerically and morally, to be considered, and the complication introduced in commercial transactions would be very slight. Scientific calculators could readily take care of themselves. Weights and measures of capacity could be dealt with in an analogous manner by an almost insensible alteration of the ounce or the pound, the pint or the gallon, though the necessity in these, perhaps, would not be so great, because the kilogramme and litre are more reasonable standards than the mètre. I am not advocating change, though I confess to leaning towards decimal subdivision and to a desire for greater uniformity and simplicity, especially in our measures of capacity; but if a change is to come, I trust it will not be by the metric system adopted *en bloc*." In conclusion the President referred to the continuous diminution in the class of Fellows, remarking that the accessions made during the past twelve months amounted to 5 Fellows, 67 Associates, 3 Hon. Associates, and 8 Hon. Corresponding Members. As a matter of fact, the class of Fellows had lost, not gained, strength. The Fellows, who last November numbered 617, at the present hour numbered 596, being a diminution of 21. The Associates, who a year ago were 872 in number, had, on the contrary, advanced to 924, being an increase of 52. In the course of the year only four out of the 872 had become Fellows, while one architect who applied, and who had never been an Associate, was elected a Fellow. Further, during the last two years (1893-94 and 1894-95) only four "outsiders" had been admitted to the Class of Fellows, though during the two previous years 56 outsiders were admitted; during the two years before 50 outsiders were admitted; and during the antecedent two years (1887-88 and 1888-89) 69 outsiders were admitted to the Class of Fellows. These outsiders were architects in the provinces, at foreign stations, in Australia and the Colonies, with a few Londoners —men who had had little, if any, opportunity when young of becoming Associates. Yet they would find that they constituted an addition of strength to the Institute, and in many instances had added lustre to the roll of Fellows. Again, of the 34 Fellows who sat on the present council, 14 were outsiders; but were he to read out the names of the 14, they would certainly agree with him in thinking that the Institute would have acted most unwisely and lost a great deal had it refused to admit them as Fellows simply because they had not previously been members of the Class of Associates. On this point, which he knew full well was a delicate one, much misapprehension seemed to exist both within and outside the Institute. In the first place, there was an abnormal amount of hesitation on the part of Associates long in practice to proceed to the higher grade. In the second place, too many practising architects of repute, and even a few of well-earned distinction, formed no part of the Institute, forgetful, as too many of them are, that its influence and usefulness would be infinitely greater were they members of the corporate body. It would be a very fit subject for the council to discuss whether greater facilities could not be made for the admission of Fellows from among those whose career showed that they would be worthy members of their body. It had more than once occurred to him during his tenure of office that one of the main reasons for the startling paucity of applicants for the Fellowship was the possibility that architects of mature age, men who had carried on extensive practice for the greater part of their lives—men whom they wished to see Fellows of the Institute, but who were not and never had been Associates—hesitated to take their chance of election at the hands of a body of electors, some of whom had only within recent years emerged from the position of articled pupils. It seems to him, for instance, somewhat sanguine to expect that men who were well-known members of the Royal Academy, of the Society of Antiquaries, and of other institutions in which for a long period they had been recognised as architects of repute and distinction, would consent to run the risks of an election dependent on the good or ill-will, or the prejudices, of some thirteen or fourteen hundred gentlemen, the vast majority of whom were their juniors, and some of whom were not even in practice. He therefore urged the Institute to consider whether the power of admitting such men to the Class of Fellows might not be confided solely to the controlling or governing body of the Institute, at least for the space of a year, or perhaps two years. The regulations which guided the council in the admission of applicants for candidature as Fellows were sufficiently definite to constitute a check on any improper attempt to make such admissions too general or indiscriminate. The change might be effected by the suspension of certain by-laws; and though such suspension would require the sanction of the Privy Council, he felt convinced that when the facts were properly explained, their lordships would acquiesce in the petition. What he proposed had good precedents to support it. For instance, in his own club (the Athenæum), the committee had power to elect from time to time distinguished persons without submitting them to the chances of a ballot of the whole body of members; and this was held to be a great honour by the persons themselves, while it was certainly of high advantage to the club. The way being thus opened, the council would have little difficulty in reaching the majority of those who should be part of the corporate body, and in effecting, to a great extent, the fusion with themselves of many, especially in the provinces, who resented the position in which they were placed from no fault of their own; but who were, nevertheless, forced to remain outside the ranks of the Institute, to their mutual regret, and, perhaps, to the latent annoyance of both.

Mr. Aston Webb, Vice-President, in proposing a hearty vote of thanks to the President for his address, which contained, as he observed, many practical and important suggestions, ventured to take exception to one or two points as to competitions. In most cases the promoters of a competition did not themselves know their requirements, and he thought that where the conditions laid down seemed intricate, difficult of interpretation, or incompatible, it was the duty of intending competitors to endeavour to ascertain their true meaning. The President had alluded to the material alterations sometimes necessary in selected designs; but in his experience the design selected by an able assessor rarely, if ever, required reconsideration on general lines. In conjunction with his friend, Mr. Ingress Bell, he had sent in very many competitive designs; but they had certainly never expended anything like the £400 mentioned as the average estimated cost of those submitted for the West Ham Technical Institute. It should be held to be the aim of assessors, when consulted as to the drawing up of conditions, to endeavour to lessen the outlay on the preparation of designs. The fact that competitors would come forward, even if the conditions were harsh, ought not to absolve promoters from striving to make fair conditions. Occasionally committees sought to set aside the awards of assessors, and he was glad that efforts were now being made to persuade the Durham County Council not to depart from the course usually adopted, of giving the execution of the work to the competitor named by the assessor. With regard to the selection question, he was by no means sure that the committees would make a wiser choice of an architect than of a design: they were usually as ignorant of the merits of the one as of the other. It was no more desirable that promoters should be absolutely bound by the advice of their assessor, than that a man should be bound without option to follow the recommendations of his lawyer or his doctor. As to the examinations, the action of the Institute in promoting architectural examinations was forced upon them by the younger men, and had been of great benefit to the profession and to students as showing what they ought to learn in their early days. The President had touched on the increasing paucity of Fellows; but it should be remembered that the class of Associates by examination was steadily growing, and in time this process must tell, and would make the Institute a more vigorous body than in the past. All should be indebted to the President for his suggestion that Fellows should be admitted directly through the council. Such a course would confer honour on both parties, and he believed the suggestion would be well received by the members, and also by outsiders.

Mr. W. D. Caröe, F.S.A., President of the Architectural Association, in seconding the vote of thanks, humorously remarked that he foresaw the day when the youngest Fellow at present on the roll would find himself by flux of time the sole survivor, and as such the only architect eligible for a seat on the council, or to assume the purple and ascend to the Presidential chair. The suggestion as to the admission of Fellows through the Council had his cordial support. In appreciative terms he referred to the long life which the President had devoted to architectural scholarship and to scholarly architecture, and put the vote of thanks, which was carried by acclamation, and briefly acknowledged by Mr. Penrose.

CONCERT HALLS AND ASSEMBLY ROOMS.—III.

By Ernest A. E. Woodrow, A.R.I.B.A.

We have now seen how a simple room may be used for many purposes, as in the case of a parish room, where such use was to be expected; but there are very many buildings which, in the first instance, are built for one purpose, and subsequently changed to be used for another. I have already mentioned the swimming-bath as a most common example of this class of building. The architect may have no other instructions than to provide a good bath; but when winter comes the owner floors over his tank and lets the hall to any person who will pay the hire, irrespective of the inadequacy of the exits and general provisions of safety. The architect must, therefore, be alive to the fact that this may happen, and where there is the slightest chance of it happening, erect his building with such exits, staircases, &c., as will be sufficient for a seated audience of the number that will fill the area of the premises. This will save his client a lot of money, as no structural alterations will be required when he applies to the authorities for a license. It must also be remembered that the dressing-boxes in a swimming-bath will be in the way when used as an assembly-room, and that the wood of which they are made will add greatly to the inflammability of the building. These should, therefore, be so arranged that they can be taken down and removed entirely from the hall when it is used for public entertainments and the bathing season is over I believe I am correct in stating that this requirement has been enforced in the conditions for a competition for the new baths in Shoreditch.

Another example of what a little forethought will do in enhancing the value of property is how the architect places his public room in an hotel. But for the fact that the largest room is often placed many feet above the ground level, is so mixed up in the fire risks of the hotel, and has no separate exits or staircase, this room might more frequently be licensed for public music and dancing, and be a source of revenue to the proprietor.

Again, we have seen how parochial rooms are always wanted for public assemblies, yet how often are they erected on some piece of back waste land where no proper ingress or egress can be obtained; where doors are made to open inwards, are fastened with barrel bolts which may fall and catch in the floor, causing disaster such as experienced at Sunderland some few years ago. Galleries are found in these buildings, even of recent erection, which have but narrow wooden staircases with winders leading into the same lobby as the floor of the hall. These staircases are little better than step ladders. The gas arrangements are most defective, as instanced in the Belfast catastrophe. No second system of lighting is maintained. The gas-meters are placed in dangerous positions; stoves are provided with flues passing near woodwork, and generally every known measure of safety is totally ignored. The general run of parish-rooms and school-rooms are the most ill-cared for and neglected places of public resort of any kind, and consequently among the most dangerous.

I fear it may be taken as a general rule that if an architect has to design a building, the use of which does not make it come under the regulations of the authorities, he seldom considers that those regulations are as applicable for the safety of a building used for lectures and social gatherings, as for concerts and dances. It is quite as necessary to look after the safety of an audience attending a teetotal lecture as one assembled at a music-hall where drinking is allowed in the auditorium. The lives of the one assembly are as valuable as the lives of the other—some might argue more so. The architect should, therefore, be alive to the fact that a building used by the public should be as carefully designed for safety, whether it is to undergo the criticism of the licensing authorities or not. By doing so, he is studying the greatest interest of his client, as he is erecting a building for which his client may eventually require the sanction of the authorities to hold certain classes of entertainment, which can only be held by having their license, and he will thus save the owner much annoyance, loss of time, and outlay for alterations.

London architects in the future will be restricted to a certain extent by such provisions of the New Building Act as relate to public buildings which are not licensed for music, dancing, or stage plays. It may not be out of place here to touch upon these points. The walls, roofs, floors, galleries, and staircases must be constructed to the satisfaction of the district surveyor, or, in event of disagreement, to the satisfaction of the new Tribunal of Appeal. Houses, &c., which are converted into public buildings must be altered to the approval of the same authorities. Staircases for the use of the public in churches, chapels, meeting-houses, public halls, public lecture-rooms, public exhibition-rooms, or public places of assembly, must be supported and inclosed by brick walls not less than 9in. thick; they must be of fire-resisting materials, with treads of uniform width—nothing, strange to say, is said about a uniform rise.

The width for staircases, internal corridors, or passageways must be 4ft. 6in. for 400 persons, 6in. to be added in the width for every additional 100 persons, until a maximum width of 9ft. is obtained; but where only 200 persons are to be accommodated, the width may be 3ft. 6in. Where a staircase is 6ft. wide or more, a central handrail is to be provided.

These requirements are based upon the old theatre regulations of the Metropolitan Board of Works, which were re-enacted in the present L.C.C. regulations for theatres and music-halls.

In lieu of a single staircase, corridor, or passageway, the new Building Act permits a substitution of two staircases, corridors, or passageways, each at least two-thirds the width required. When only one staircase is provided, architects may be expected to avail themselves of this provision, for two staircases are always better than one, and two staircases each 4ft. wide would be immensely more valuable than one 6ft. wide. A staircase wider than 4ft. 6in. is a mistake where crowds have to descend rapidly, as there is not sufficient support at the sides to insure people going downstairs without falling.

Separate means of exit into the street, or open spaces, from the galleries will in future have to be provided for places of public assembly which are not under the theatre regulations. Doors and barriers will have to be made to open outwards, and no outside locks or bolts allowed.

This is a great step in the right direction, but it still leaves much for the architect to do to make his building a safe one for the assembly of numbers of the public. It is a pity these sections of the new Act cannot be made to apply to old buildings used by the public.

The requirements for concert halls and assembly rooms which need, by virtue of the nature of their entertainment, a music and dancing license, I shall have to deal with in full as these articles proceed.

So far, I have been speaking of the room, or hall, used for many purposes, quite apart from the hall, which is designed and used for concerts only; but it is very seldom that a hall can earn an income by being used for only one class of entertainment: sooner or later the proprietor has to change his bill or put up the shutters. The architect must therefore remember this when making his design. It is true that the architect, however careful he may be in his observance of every detail for public safety, is always at the mercy of the mismanagers who are put in charge of the building on its completion. He may provide six exits from his hall, and the hall-keeper be of opinion that three are sufficient, and omit lighting the gas and lamps in the other three, as I have known to be the case. He may, and certainly will, if he be a wise man, put automatic bolts on his doors, and find the attendant add a padlock and chain so that they will not open; he may build store-rooms for the chairs, stage, orchestra fittings, &c., and the chairs and forms may be hurriedly placed in the passages and lobbies; he may see his exits obstructed during a performance by rows of chairs, the people seated thereon enjoying themselves, but quite oblivious of the fact that they are placing themselves and others in danger; his staircases may be blocked by ticket-boxes and barriers; his safety-lamps may be unlit; and the hose from his hydrants removed to wash down the yard; and yet the architect is quite powerless. The only satisfaction he has is that when a panic does occur, accompanied by loss of life, and followed by an inquest, he, at least, will be held blameless.

It is clearly the duty of the architect who has no control over mismanagement and the introduction of dangerous fittings, accompanied by such terrible risks, to, at least, provide a building where the fear of a fatal rush from panic will be brought to a minimum by the well-planned, well-placed, and numerous straight exits, the wide passages, and the well-designed staircases.

A large number of concert-halls and assembly-rooms are attached to town halls. These rooms in town halls are more frequently than not placed on the first floor over the vestry offices; their exits all deliver into a vestibule common to these offices and the public hall, and the fire risks from the offices are added to those of the hall. It is argued that the offices are not used at night when the hall is; but that argument is a poor one, for the very fact of them not being in use is an assurance that should a fire occur in them that fire will not be discovered till after it has got a good hold of the room, and until it is creating smoke sufficient to rise up the staircase into the hall and create panic. Again, a fire frequently smoulders for hours before it breaks out, so that the fatal spark may be actually locked in a room on the departure of the vestry officials, waiting to burst into flames when the hall is filled by the public.

Rooms should never be placed unnecessarily above the street level, especially when they are of such a size as to hold on the area or floor level as many as a small theatre. A theatre holding a thousand people is provided with numerous exits; but the architect who places six hundred to a thousand seats on the floor of a hall situated many feet above the street seldom gives as many exits to his hall as he would to a theatre of the same holding capacity.

There is one danger to the class of building of which I am now speaking which may not be often thought of—a danger arising frequently at political meetings or assemblies, where the audience are carried away by excessive excitement. I refer to that imbecile who finds relief to his feelings by calling out "Fire." Such dreadful insanity does possess some few, and whatever the cause of the stupidity, the effect is attended with great danger, especially in a densely-packed mob already worked up to a pitch of intense excitement. How can the architect contend against such odds as these? Only by safety planning.

COUNTY LUNATIC ASYLUMS.—XXXII.

By George H. Bibby, F.R.I.B.A.

LUNATICS' WARDS IN WORKHOUSES.

ONE of the earliest notices of the establishment of an asylum for the insane is in the life of St. Theodosius, who is said to have been born in the year 423, and to have died in the year 529, at the great age of 106 years. He is said to have established, near Bethlehem, a monastery, to which were annexed three infirmaries—one for the sick, one for the aged and feeble, and the third for such as had "lost their senses," in which "all succours, spiritual and temporal, were afforded with admirable order, care, and attention," and probably the fourth division of this establishment was occupied by the *working* inmates.

Perhaps the modern English workhouse exhibits, in a general way, the only corresponding existing provision (comprised in one institution) for three classes of the above description, for in workhouse buildings special wards are not only provided for the able-bodied and children of both sexes, but also for the sick, aged, and infirm, and for pauper imbeciles and lunatics, these latter being best housed when at some distance from the sane occupants, and as far as may be out of their sight and hearing.

I have already directed attention to the fact that the building requirements of the Local Government Board, as regards lunatics and imbeciles in workhouses, are far less exacting than those of the Commissioners in Lunacy for patients in county asylums (*vide* Building News, Oct. 18, 1895, p. 553). The result is that patients, being maintained at a less cost in workhouse lunatic wards, are not unfrequently permanently kept there; whereas they would be better provided for in a county asylum. This appears to be particularly evident in Ireland, as may be seen from the reports of the Irish inspectors of lunatics.

Until fifty years ago the buildings for pauper lunatics were nearly always inadequate for the purpose, both as regards construction and number, and vastly different in every way (and particularly as to management) to those now provided in these Islands. There can be no doubt that the local authorities had a great horror for all such institutions, as only causes of expense to the ratepayers, and frequently permitted the insane to live how they could. In a certain district (containing many resident gentry who were not remarkable for displaying less than the usual benevolence of their class towards the poor) two helpless individuals deprived of reason were allowed for many years to live in a most miserable condition, and no further illustrations as to the then necessity for improvement in asylum construction and management would probably be considered requisite.

In the first case an insane female occupied a wooden shed, resting against a garden wall, a receptacle of very slight materials, 5ft. long by 4ft. 6in. broad, pervious to the elements at every seam, and having no door to fill up the entrance except a bunch of rags, which could be suspended for that purpose. Her bedding was a bundle of straw, and her food was contributed according to the good-will of her immediate neighbours, for she was too old and feeble to beg. She occupied this place for about 20 years, and was supposed to have escaped from a lunatic asylum. She was at first possessed of some accomplishments (music and needlework), indicating an origin and education above the common rank. Having a horror for stone walls, she took up her quarters in an open shed; then she obtained an old hogshead, which she was permitted to occupy till it rotted about her, and subsequently obtained the garden-wall shed, where the neighbours usually contributed a few shillings at the beginning of each winter to obtain for her a rug and a few clothes. The guardians of the poor of the parish never paid the least attention to this unfortunate creature, or disbursed one farthing in her behalf.

The second instance is that of another insane woman, who resided (about a mile from the first mentioned) within an open shed near to a farmhouse. In this case the shed was merely an erection, consisting of two or three pieces of wood placed in a slanting position against a wall, and overlaid with a quantity of straw. It was quite open towards the north, and hardly approachable for filth. It was also too short for the extended body of a human being; yet there, with a small log for a pillow, and a few clothes supplied by the parish authorities, was the only home of this miserable woman. When she lay in this loathsome den, too wretched to be a proper habitation of a pig, she was obliged to arrange herself like a cat, with her head and feet nearly together. Her food was supplied by the spontaneous contributions of her neighbours, and otherwise she was not interfered with, although sometimes violent in her conduct.

In defence of the parish authorities it was stated that the two wretched women preferred their sheds to houses, and that "placing them in asylums would drive them frantic or destroy them." A surgeon is said to have actually given his testimony to this effect, adding, in the case of the first-mentioned woman, that "the treatment she received seems as kind and humane as the circumstances will permit." On the other hand, a newspaper reporter stated that when he went to her den he "found her sitting shivering with cold, and covered with wet rags—rags literally soaked with the rain which had fallen in torrents during the preceding night, and had come in through the numerous chinks in her wretched dwelling." Her straw was changed once a week. The attempts of these authorities to exculpate themselves only made their case the worse; for who ever heard of the freaks of insane persons being humoured, when it was necessary to take measures for humanely disposing of them? From this point of view an orphan might have been allowed to wander about like a wild animal, unclothed, unfed, uneducated, merely because she preferred freedom to being reared in a workhouse. The real cause of these women being allowed their own will was that it coincided with what was considered best for the parish funds, and the policy of some local authorities of half a century ago was to discourage all claimants for relief, and to endeavour to escape the necessity of sending paupers to lunatic asylums.

In the planning of wards for harmless lunatics and imbeciles under workhouse control, there are various points to which the Local Government Board direct attention.

In the first place, it must be borne in mind that in a large workhouse establishment there must be accommodation for the following classes, in addition to those kept as lunatics, and that whether a workhouse be intended for *all* the classes mentioned, or only for a single class, or for a few of those classes, it is essential that there should be a complete separation of the sexes, and also as far as may be of classes, and to this end distinct dormitories, day-rooms, entrances, staircases, yards, water-closets or earth-closets, lavatories, &c., should be provided for each sex and class. The classes to be provided for are—"Aged and Infirm," "Able-bodied," "Harmless Lunatics and Imbeciles," "Sick of all Classes," "Children," "Infants," "Aged Married Couples," "Probationers," and "Vagrants," and a complete workhouse for a large union should ordinarily comprise the following separated buildings—i.e., imbecile wards, isolation wards, sick wards, schools, vagrant wards, main buildings, and entrance buildings; but in small workhouses, where the number of inmates and officers is very limited, some of the above-mentioned separate buildings may be dispensed with.

The following are the requirements and suggestions of the Local Government Board as to accommodation for "short-period lunatics" in workhouses, and relate to the provision which should be made in workhouses for the accommodation of persons who are alleged to be, or who are, lunatics, and who are removed to the workhouse under section 20 or 21 of the Lunacy Act, 1890.

The extent of the accommodation will depend on the requirements of the particular union; but arrangements should be made for the simultaneous accommodation of persons of both sexes, with their attendants. In large workhouses provision for the reception of short-period lunatics may in some cases be suitably provided in connection with the wards already set apart for imbeciles; but in the smaller workhouses it may usually suffice to so arrange two wards and an attendant's room with padded room, that one of the wards may, if necessary, be entirely shut off from the other portion, for the joint use of a patient and attendant.

Each ward should be large enough for at least two beds, to enable a person in charge to be in constant attendance, and the amount of space allowed should not be less than 100ft. floor space, and 1,200ft. cubic for each bed. All sharp projecting angles should be avoided. Ward floors should be of wood. Ledges, architraves of doors, internal window-sills, and the like should be avoided. No brackets, pegs or nails, &c., should be fixed to the walls. Door-handles should be *sunk flush*, and doors arranged so as to open outwards. For wards of this kind strong window-frames, with vertical swing sashes, 6in. wide, extending for nearly the whole height of the window, glazed with small panes of stout plate glass, and working on pivots top and bottom, are suitable.

Artificial light should be furnished from the adjoining attendant's room through a fanlight glazed with ½in. plate, and under the control of the attendant, whose room should command a view of the whole ward by a small window of similar strength.

Ventilation and warmth should be provided in wards of this kind by an air-chambered grate in the attendant's room passing fresh warmed air into the wards; air-bricks should be fixed also in suitable positions, in addition to the opposite external windows, which are indispensable in each ward.

The imbecile wards should provide for the ready sub-division of the patients according to their habits and condition, and should be so arranged as to afford the utmost facility for the constant supervision of the patients; and as respects ventilation and all arrangements for the comfort of the occupants, they should be regarded and treated as *sick wards*.

The requisite minimum space per head for this class of inmate is, in the dormitories, 5ft. of wall space (irrespective of doors and fireplaces), 50ft. of floor space, 10ft. height, and 500ft. cubic space; while in the day-rooms 20ft. of floor space, 10ft. in height, and 200c.ft. of space are required.

Due provision should be made for securing cleanliness of person, and for the supply of hot and cold water; but in many cases a portable bath used in the ward may suffice.

In the above arrangements generally the requirements of the Local Government Board are below the standard of the Commissioners in Lunacy, and of the corresponding authorities in Scotland and Ireland; but for this difference there does not appear to be a satisfactory justification, the inmates of county asylums and of workhouse lunatic wards being alike dependent upon the ratepayers.

(*To be continued.*)

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—VII.

By Joseph Horner.

CONTINUING in detail the several points in which good castings differ from those which are imperfect or bad, Fig. 19 is drawn to illustrate the appearance of a spongy top face of a column casting. The sponginess may be greater or less in extent than that indicated by the drawing; but the general appearance is unmistakable, and the term "spongy" or "honeycombed" expresses exactly that appearance. The holes will range from the size of a pin's-head to that of a pea or a hazel-nut. When larger, they have gone past mere sponginess, and are termed blow-holes. Often, as in blow-holes, the worst does not appear on the surface—a film of metal conceals a lot of honeycombing. An inspector will try the most minute holes with a bit of wire or a long pin, and often discover in that way that a very small hole on the surface will extend for several inches beneath the surface, opening out really into a large blow-hole. Such sponginess is almost invariably found, when present, on the upper surfaces of castings, where the pressure is least; seldom on the lower, where it is greatest. In some positions it is of relatively little moment; in others it should condemn the casting. Those parts subject wholly to tension, as the bottom flanges of girders, should never be passed if the honeycombing is at all extensive or deep. In the case of lugs subject to tension, honeycombing such as that shown in Fig. 20, is quite condemnatory, even though all the rest of the casting were perfectly sound. Honeycombing on column flanges is also serious, because on the flanges the stability of a column largely depends, and the strain of the bolts is liable to pull such flanges off. Sponginess down one side of a column may or may not be serious, dependent on its extent and depth. A practised observer can usually form a correct opinion about that by probing, and by general appearance; but when columns have to be subjected to severe stress, it is better to condemn all which show any traces of sponginess. They can be well cast if the mould is properly vented, the metal clean, and sufficient risers put on. Minute cracks in columns have sometimes been pened over with a hammer. The same practice is resorted to when there are honeycombed surfaces, the hammer-blows closing them, and smoothing the surface over. The most satisfactory test for the closeness of grain and freedom from sponginess of a column is the hydraulic, just as it is used in the case of water- and steam-pipes.

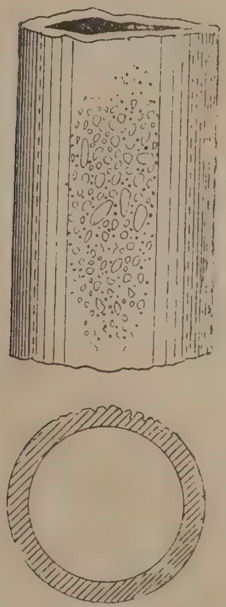

Fig. 19.

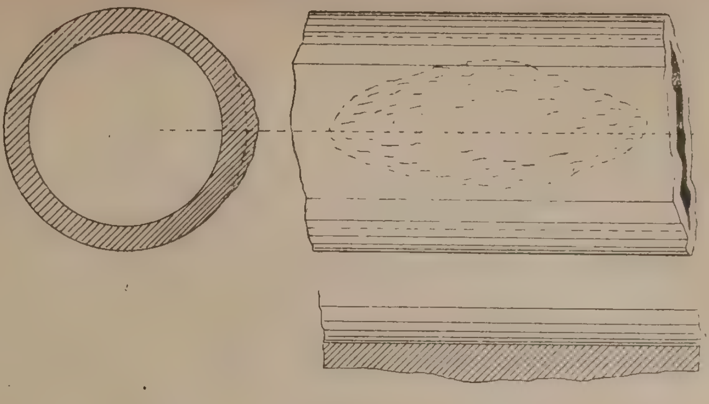

Fig. 22.

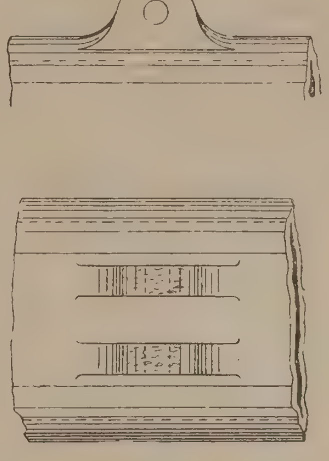

Fig. 20.

But there is an evil perhaps worse than this, and that is the presence of large blow-holes. The utmost care does not always suffice to prevent these. They are due to insufficient venting of mould or core, to moisture, and to the entanglement of air in the molten metal. Ample venting and steady pouring, with the use of risers, are the best preventives of blow-holes. Unfortunately, they are very often concealed by a film of metal, as in Fig. 21. Hence the top faces of all castings—which can always be known by the marks left from cut-off runners, risers, and chaplets—should be tested with hammer-blows, when hollow sounds will indicate the existence of concealed blow-holes, and a sharp blow will break through the thin film. Another way to detect them is to thrust a fine wire in some of the suspicious-looking small holes when such are present, when it will often penetrate several inches, revealing the fact that there is a blow-hole beneath. A smooth skin will often conceal hidden faults of this kind. Fig. 21 illustrates an extensive blow-hole in section below, and its locality and extent are indicated by dotted lines in plan above. Such blow-holes seldom occur, except on the upper portions of castings. These often extend over large areas without any external indication of their presence, because a thin film of metal so frequently covers and incloses them. They exist either with, or without association with general sponginess. As they generally occur on the top, and as they are often completely hidden, it is quite necessary to test all castings along their top faces with smart blows from a hand-hammer. Such blows do no harm to a good casting; but they will either return a hollow sound or break through the skin, if large blow-holes are underneath.

Blow-holes in castings are less serious when they occur in those portions subject to compression than in those subject to tension. A few blow-holes occurring at intervals in the former would not sensibly increase the risk of crushing; but in the latter they would be highly dangerous. The same remark applies to general sponginess or openness of grain. Blow-holes in the neutral axis of a casting are of no moment. This is illustrated by the fact that holes may be drilled in the neutral axis of a test-bar, and the drilled bar will sustain the same load as a solid bar; on the other hand, if the bar were turned upside down, bringing the thinner metal into tension, it would fracture quickly. The fact is also illustrated by the practice of lightening out a girder along the neutral plane. Sponginess on the compression side of a casting will slightly increase its deflection; but, all the same, it is risky to pass work in which blow-holes occur,

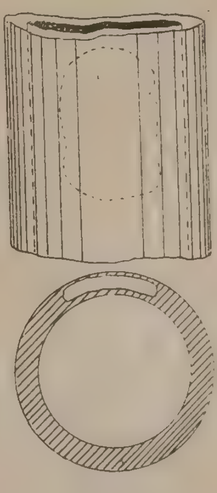

Fig. 21.

even in localities subject to little or no tensile stress; because if a casting is blown in one place, it may also be so in another, of which no indications are visible.

An extensive scab is shown in Fig. 22. Such scabs occur on all parts of castings—top, bottom, and sides. They are due to the washing away of sand caused by hard ramming, weak sand, and bad venting. The fettlers chip them off. But an inspector can see where such extensive chipping has been done, and all castings that show signs of much scabbing should be condemned. It is not because the scab has been cut off, but because it presence is a sure indication that there are masses of sand, corresponding in size with the scab, imbedded somewhere in the body of the casting. Such masses may or may not come to the surface. If invisible, they constitute a hidden source of danger. It is quite likely that the corresponding hole or holes are not to be found, being perhaps covered with films of metal, but there is no doubt about their existence somewhere. So that the presence of extensive scabbing is quite sufficient to condemn the castings in which it occurs as unsound.

Fig. 23, A, illustrates the defect which is termed a cold shut. Its presence should condemn any casting, no matter where it occurs. The casting is really as good as fractured where the cold shut occurs. It means this: that the metal has been pured so cold and dead, or that the metal has had so far to travel in the mould that it has become chilled; consequently, when opposing currents meet, they do not mix as perfect liquids, but only to a partial extent. Being so cold, they form a joint or imperfect union, much like a bad weld. These are also caused by using poor iron with no life in it, or by using iron badly melted, as well as by allowing iron to remain too long in the ladle before pouring. When only a moderate stress comes on the casting, the cold shut becomes the weak link in the chain. These shuts can usually be recognised by the rounded appearance of the edges along the irregular groove or fissure where the metals have met.

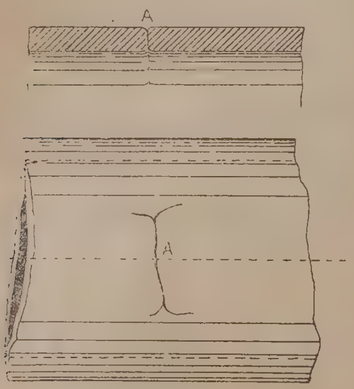

Fig. 23.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL. —XXIV.

IT was explained in our last article that the repeated applications of the same load will cause a bar or other section of iron and steel to fracture under a stress less than that of its ultimate statical breaking strength. A practical example, and the mode of calculating the dynamical breaking strength of a bar of iron, was also fully investigated. This rule, as it was stated, was applicable only to those cases in which the stresses induced upon the bar by the load were of the same character or sign. It is evident that some change must take place in any specimen of metal when subjected to the action of repeated application and removal of the same load, or otherwise we should have the statical strength of it equal to the actual breaking strength when under experiment. This change or loss of strength, for that is what it really amounts to, has been termed the "fatigue" of the material. Experiments on steel bars, made by Sir Benjamin Baker, in which the bars were repeatedly bent and twisted, demonstrated most conclusively that the fatigue of the material was greater when the repeated stresses were of a tensile character, and less when they were compressive. Although the distinction between the statical and dynamical breaking loads of iron and steel has been shown to be very considerable when the specimen was subjected to stresses of the same character, the difference becomes still more accentuated and most marked when the bar undergoes alternate stresses of tension and compression. The fatigue or loss of strength, which may be due to a deterioration of the elastic properties of the fibres, becomes greater, and the specimen consequently yields to a still smaller dynamical breaking weight. Railway axles when fractured constitute excellent examples of the truth of this statement. In their incessent revolutions the upper and lower fibres are continually subject to stresses of alternate tension and compression or "reversals." It would be beyond the scope of these articles to investigate this question more fully; but it will be again referred to in dealing with its effects upon the different members of open-web steel girders. The practical evil results accruing to members of girders from reversals is so well known to engineers that some of them design their bridges and roof trusses in such a manner as to avoid all probable chance of any of the parts of them being so acted upon. This is by no means an easy task to accomplish in theory, and it is exceedingly doubtful, having a due regard, especially in railway bridges, to unforeseen and inevitable working contingencies, whether so nice an adjustment of stresses is ever really arrived at. It is preferable to acknowledge the possibility of reversals on some, but not all, the members of a girder, and allow a margin for them than to attempt to prevent their occurrence.

As a matter of fact, some parts of nearly all bridges, roof and other structures, are exposed to alternating stresses, and it becomes absolutely necessary to provide for them, first by calculation of their actual amount, and secondly, by apportioning the sectional area of the material to adequately resist them. In the case of a bar or other specimen under experiment, let T be the greatest tensile stress to which it is exposed, and C the greatest compressive stress. Put S for the breaking strength of the bar under the same conditions of repeated applications of the same load as in our last article, and S_1 for its breaking strength when subjected to reversals. Let W represent the actual breaking weight to be calculated. Supposing the bar to be of steel or iron, we shall have—

$$W = S\left(1 - \frac{S\,T}{C}\right) + \frac{S_1\,T}{C}$$

making the ratio—

$$\frac{T}{C} = R$$

the equation becomes—

$$W = S\,(1 = R\,S) + R\,S_1.$$

Let a bar of steel be subjected to a maximum tensile stress of six tons, and a maximum compressive stress of nine tens, then—

$$\frac{T}{C} = R = \tfrac{2}{3}.$$

From this value of the vibrating ratios we obtain, substituting it in the above formula—

$$W = S\left(1 - \frac{2\,S}{3}\right) + \frac{2\,S_1}{3}.$$

From the results of experiments, we know that the following values have been found to hold for S and S_1 in tons per unit of area—

$$S = 16\,.\,S_1 = 9.$$

Inserting these values in the equation for W, we have—

$$W = 16\,(1 - 10{\cdot}7) + 6 = 11{\cdot}3 \text{ tons.}$$

The actual statical breaking weight of the steel specimen is about 29 tons, so the effect of reversals in causing "fatigue"—that is, in reducing the strength of the material, is sufficiently obvious. It has been stated that the total effect of alternating stresses or reversals is equal to the sum of the two descriptions of stresses regarded as being of the same character. Employing the same notation, if T and C be the maximum stresses to which a bar is subjected, and supposing C be greater than T, then it is not sufficient to design the bar of the proper form and sectional area to support the stress C, but it must be made strong enough to support a stress, S, equal to—

$$S = (T + C).$$

In the example above, T was made equal to six tons per square inch, and C to nine tons, so that instead of calculating the area of the bar and designing the form of its section to resist a compressive stress of nine tons, which would, *à fortiori*, resist a tension of six tons, it would be necessary to design the bar so as to enable it to withstand a stress of 15 tons.

Without adopting this rule in its entirety, engineers have for some time past recognised the necessity of employing a different distribution of the material in the various parts of girders and trusses than had hitherto been the practice. The old rule of the Board of Trade, fixing the safe-working stresses for wrought iron at five and four tons per square inch for tension and compression respectively, and at 6½ tons for steel, is too vague to be any longer applied indiscriminately to every member of an open-web girder. In a bridge liable to violent loads applied suddenly, some parts of the steelwork are considerably more affected by it than others. Girders of small span, such as plate and box girders, and others belonging to the same type, as a class may be included under the old regulation; but in structures in which there is a large range of stress, combined with heavy rolling loads, some nicer adjustment is, at any rate, desirable, if not indispensable. In some recent designs for very large suspension bridges in America the working stress per square inch for those parts of the bridge subject to reversals has been taken as one-fourth of that allowed for the wire cables and parts which are strained solely in tension. The general law governing the safe loads under the three conditions investigated may be thus expressed. If L represent the safe statical load, L_1 the similar load when the members are subjected to repetitions of the same stress, and L_2 the load when reversals take place, then—

$$L_1 = \frac{L}{2}, \text{ and } L_2 = \frac{L}{3}.$$

When treating in former articles the subject of steel-plate bridges, it was pointed out that, so far as choice was concerned, the designer had little or none. There are only three descriptions of this particular type of bridge—the tubular, the double-plate web, or box girder, and the single-plate. The first of these is obsolete, the second is unsuitable, and the third remains as an example of the principle "survival of the fittest." But in the matter of open-web girders, the engineer has almost an unlimited selection at his disposal, although there are only a certain number of recognised types of open-web girders and roof trusses. With the latter we are not at present concerned. It will be subsequently perceived that, although the number of actual types is limited—large though it is—the different manner in which the tracing may be arranged inside the members constituting the boundary lines or perimeter of the various girders, permits of almost endless combinations. It may be remarked that some of these bridge trusses—for there are bridge as well as roof trusses—are better adapted for timber than steelwork; and others, again, answer well when both materials are employed in the same structure. Steel and timber, provided the latter be in large scantlings, will make a good, strong, cheap bridge; but the combination is now seldom employed. In these compound trusses the steel may be used for the lower boom, and for other members which undergo stresses of tension, while the timber is employed for the members in compression. One advantage of this mode of construction is that, as the timbers decay and require renewal, the operation can be effected by removing them singly in succession, without the necessity arising for stopping the traffic. With the exception of the braced arched rib, in which the curved chords or booms are struck from the same centre, and its inverted form, the hanging girder, all open-web girders may be divided into two principal types or classes. The first comprises all those in which the flanges or booms are parallel to one another, and the second all those in which the same conditions do not obtain. Of all existing examples of the rigid braced arched rib, the finest is furnished by the bridge crossing the Mississippi at St. Louis. It is built of steel, consists of three spans, two side-spans of 502ft. and one central span of 520ft. There are four ribs in the total width of the bridge, which is 52ft. Each rib is built up of a pair of steel tubes spaced vertically, 12ft. apart from centre to centre, and braced together by diagonal bars. It carries a roadway above the crown of the arch, and a double "track" underneath the roadway, and cost £1,366,000. The hanging girder, by which is not meant an ordinary suspension bridge, although it may be *in posse*, is not yet *in esse*. A very good idea of the general features of this magnificent American bridge will be obtained from an inspection of Fig. 4, which represents a skeleton elevation of the central span, the upper and lower horizontal lines indicating the relative positions of the roadway and the double line of railway. If the arched rib be inverted, it becomes a hanging girder, shown in Fig. 5. There are some points of difference in the erect and inverted structures deserving of notice. In the first place, the tendency of the one is to thrust out the abutments; that of the other to pull them together. While in the arched rib both the concentric, convex, and concave booms are in compression, those of the hanging girder are in tension. Again, the vertical members in the former are also under compressive stresses, and those of the latter under tensile.

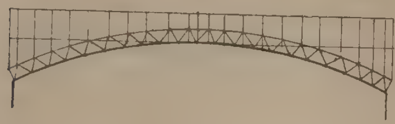

Fig. 4.

Since steel will carry a considerably greater load—that is, support safely a greater stress per unit of area, of a tensile than of a compressive character, it would be reasonably supposed that a type of girder or truss in which all its members were in tension, would prove the most economical form of construction. Theoretically yes, but practically no, or at least not under all conditions. The amount of material which is practically required to stiffen hanging or suspended girders is much beyond what is required for the arch type, which carries within itself a certain amount of rigidity, whether it be a plain solid arched rib, a braced rib, as in the example under notice, or a braced arch proper, which in reality, if the arch be hinged at the centre, consists of two braced cantilevers. The most recent, as well as the largest, example of this last-mentioned particular description of the arch form is that afforded by the Tower Bridge. Each of the lifting leaves or semi-arches are 100ft. in span, and are, strictly speaking, braced cantilevers, as already stated, and balanced by the counterweights hidden within the towers. Examples of the solid arched rib are numerous, from the small specimens spanning the underground stations of the Metropolitan Railway to the two steel arched ribs of the Harlem River Bridge, with spans of 510ft. each. As a corroboration of the statement respecting the amount of material required for the sole purpose of stiffening suspended girders, it may be mentioned that longitudinal stiffening girders are indispensable to all suspension bridges of great span. These girders, which are double—one on each side of the bridge—run the whole length of the span, and rest upon the floor beams which are supported by the cables. Not only do these girders carry no load themselves, but they even do not carry their own weight. They serve simply to distribute the rolling load; they add nothing to the strength of the bridge itself, and are absolutely so much dead weight. The more efficiently they affect this distribution, the greater is the check given to oscillatory vibration, the more are the disturbances due to the live load controlled, and the less the deflections in the cables and the whole system. Theoretically, these girders are liable to reversals, but rarely in practice. In a suspension bridge of large span, the weight of the pair of stiffening girders has been estimated as equal to nearly one-half the whole permanent load.

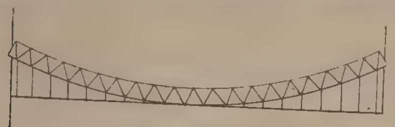

Fig. 5.

In addition to the general classification already given of open web-girders, it will be necessary to subdivide them under minor heads, as any alteration, either in the form of the booms, the angle of the bracing, the length of the panels, or the disposition of the loading, will, in one manner or the other, affect the relative value and economy of the whole structure.

* * *

New Y.M.C.A. premises in the High-street, Honiton, were opened on Friday. The building occupies the site of a disused boot factory, and has been erected from designs by Mr. Cole, of Exeter.

MESSRS. CHARLES JENNER AND CO.'S NEW PREMISES, EDINBURGH.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THESE new premises have quite lately been erected by Messrs. Charles Jenner and Co. to take the place of the building which was completely destroyed by fire in 1892. This well-known establishment was founded in 1837 by Mr. Charles Kennington and Mr. Charles Jenner. Free Renaissance has been chosen by the architect as the style of the building, and it includes the characteristics of the Jacobean architecture of England as practised by Inigo Jones and Wren, as well as the French Renaissance of the valley of the Loire. The most striking and novel features of design are the shop arcading and the great octagon tower at the angle of Princes-street and South St. David-street. The arches of the shop arcade rise to a height of 22ft. above the pavement of Princes-street, and on that frontage of 80ft. there are six bays. Fronting St. David-street there are twelve bays, and the arcading becomes lower towards the north in consequence of the level of the street rising in that direction. Between the piers of the arcade the windows are recessed for 2ft., so that passers-by or intending purchasers are able to inspect the goods displayed without being jostled. The pier bases are of dark blue granite, nicely moulded, and the piers themselves are of rich red Aberdeen granite from the Hill O'Fare Quarry, all beautifully polished and in large blocks. Yellow freestone from Crags Quarry, Northumberland, has been used for the pier capitals and the arches, which are deeply moulded and carved, the archivolts having the keystones and billeting usual in the style. The main doorway in Princes-street, and the carriage entrance from St. David-street have deeply recessed porches, floored and lined with marble and granite, and the exteriors are pedimented and richly carved. Rising to the height of 120ft. above Princes-street, the great angle-tower has a very striking appearance. The orders of architecture have been replaced by statues upon the first and fifth floors representing various nations of Europe and America with which the firm have dealings. In the angle-bay of the tower typical female figures in national costume, representing England and Scotland, have been introduced. In the bay fronting Princes-street are similar figures representative of Ireland and France; whilst the bay facing St. David-street is occupied by representative figures of America and Germany. There are twelve statues, each of them being 10ft. in height. On the upper story the orders of architecture have been replaced by caryatides of a more conventional type. Sculptured representatives of various styles of beauty support the caps and superstructure of the gables and dormers, the lower parts of which features are treated in a more severe style, introducing columns with richly-carved volutes and scrolls. An outstanding feature of the building is the rich horizontal lines of decoration formed by the balconies upon the various stages. The street-floor balcony is a monogram in the Jacobean style, with the emblematic letters of Charles Jenner and Company intertwined. On the angle tower these balconies are more richly treated with carved shields, on which are placed the coats of arms of the chief cities of England and Scotland. The upper part of the great tower is most elaborately decorated. Arcaded windows, surmounted by a carved parapet with coats of arms in the centre panels, carry the eye to the flying buttresses, on which have been placed richly-carved figures representing the Four Seasons, while on a higher level the circular windows are ornamented with palm leaves. The pier-tops of the flying buttresses are domical in shape and richly carved. On one corner there is a handsome Renaissance tourelle which contains a staircase leading to a platform on the top of the tower. Carved cupids ornament the pediments of the door-pieces at the Princes-street and the St. David-street entrances, with emblematical signs illustrative of reception and despatch of goods. This is certainly a somewhat novel architectural treatment, but it harmonises well with the other decorations. There is also carved on each side of the doors the monograms of the present partners, Mr. James Kennedy and Mr. Donald Kennedy. If it be possible to construct a building absolutely fireproof, Messrs. Charles Jenner and Company's has that quality. To make assurance doubly sure, fireproof bricks have been largely used in preference to stone; even the external stone walls being lined internally with brick. Between the Princes-street and the St. David-street block a thick fireproof wall rises from the foundation to the roof, and the openings in this wall are protected by fireproof doors in the same manner as the iron curtain in theatres separates the proscenium from the auditorium. All the internal beams and standards carrying the various floors and roofs are of the best steel, and from the great strength of this material the architect has been able to reduce the number of these supports to a minimum. Every piece of steel-work is imbedded in Portland cement concrete, and is thus rendered impervious to the action of either fire and water. The floors are fireproof, and are constructed on a novel principle which combines unusual strength with extreme lightness. The spaces between the beams are from 10ft. to 12ft. wide. These spaces are covered with a single slab of Portland cement concrete from 3in. to 4in. thick, and the heart of this slab is filled with square steel rods closely set and laced together with wire to similar rods running in the opposite direction. By this means a floor capable of carrying several hundredweights to the superficial foot has been obtained, which can neither be damaged by fire nor water. This floor is covered on the top with marble or wood-block paving from $\frac{3}{4}$in. to $1\frac{1}{2}$in. in thickness, according to the situation and the wear and tear to which it is exposed. Even the roofs are constructed of steel and concrete, covered externally with slates and Val de Travers asphalte, so that the whole building is as nearly fireproof as the ingenuity of man can suggest. The architects are Messrs. George Beattie and Sons, 136, George-street, Edinburgh, and upon Mr. W. Hamilton Beattie, the senior partner of the firm, devolved the personal supervision of every portion of the building which he designed and carried out. The sculpture decorations were carried out by Mr. Birnie Rhind, R.S.A., Edinburgh; mason and brickwork, Messrs. James Young and Sons, Edinburgh; granite-work, Mr. Wm. Keith, jun., Aberdeen; glass enamelled drain-pipes, Messrs. Walter Macfarlane and Co., Glasgow; asphalte pavement and roofs, Val de Travers Asphalte Company, London; passenger and goods lifts, Otis Elevator Company, London and New York; pavement and floor lights, Hayward Brothers and Eckstein, London; pitch-pine and birch-block flooring, Wood Block Flooring Company, Ltd., London; shop counters, fittings, and fixtures, Messrs. Charles Jenner and Co., Edinburgh; pneumatic cash tubes, Henry Walker and Co., Newcastle; iron cisterns and tanks, Messrs. Braby and Co., Glasgow.

* * *

HANDBOOK OF GASFITTING.*

MESSRS. JAMES STOTT AND CO., the gas-lighting and ventilating engineers, and the patentees of the well-known and useful automatic gas governor, have brought out a little handbook for the use of architects and surveyors, with tables of tests by Mr. Arthur H. Crump. The profession have need of such a book of reference; for years the architect has been without any guide to gasfitting and lighting, and has been obliged to wholly rely upon the gasfitter for information as to technical points. In specifying for gas-fittings and ventilators, he has been obliged to consult catalogues that are not always reliable. As Messrs. Stott say in their preface, "the object to be obtained in fitting a building with gas-pipe is to provide for an equal distribution of gas, so that, when fully lighted up, the pressure will be found as nearly as possible equal at all points on the same level—a condition which gives the most efficient and economical results." The gasfitter has generally his own way in the selection and running of the pipes, for all that is generally specified is the number of places which are to be lighted; hence he is not particular as to how he can cut down the cost by using small and inefficient pipes. By the rules laid down in this little book the architect will in future be able to specify the sizes of all pipes, and the best methods of fixing them, so that nothing of importance need be left to the gasfitter. To further this object, a specification and bill of quantities are given as models, which, with slight alteration, can be used for all classes of gasfitting. Such matters as the quality and strength of pipes, these being of wrought iron, welded and screwed to the standard threads, and capable of resisting a steam pressure of 60lb. per square inch—bends, elbows, sockets, tees, wall-hooks, and a variety of other details are given. Several matters are discussed, as the height of gas-jets from floor—an important point in designing a scheme of lighting. A table is given showing the candle-power per 1,000sq.ft. of area. Here we find that for villa dining-rooms 250 candle-power is required; for schools and churches, 300 candle-power; for cottage parlours, 150 candle-power per 1,000ft. of area. It is most necessary to provide for this candle-power in providing gasfittings. Next the question of the kind of gas lights is discussed. For certain purposes group lights can be obtained in "Sunlight" patterns, having an aggregated value for lighting of 2,500 candles, with an efficiency of 25 to 30 candles per 5c.ft. per hour, and these can be combined with a ventilating arrangement by which the products of combustion can be carried away to an extractor. With regard to sizes of pipes, the architect often leaves this detail to the gasfitter, the result being that smaller pipes are introduced than are necessary for delivering the given quantity of gas. How few of those engaged in lighting buildings by gas consider the question of pressure, upon which the delivery depends, or the size of pipe necessary for a given pressure, or its length and friction! It is shown, for example, that the friction varies directly as the simple measurement of the internal circumference of pipe. Hurst's and Professor Pole's formulæ are given, which show that the carrying power of a pipe varies as $\sqrt{D^5}$, which gives a 4in. pipe 32 times the carrying power of an inch pipe. The authors say this cannot be verified, and they give a new formula and a table by A. H. Crump. Except for short branches, $\frac{1}{4}$in. and $\frac{3}{8}$in. pipes are to be avoided, as they are liable to choke up. For underground pipes, nothing less than $\frac{3}{4}$in. is recommended. A very useful table is given showing the number of lights that can be supplied from pipes of varying diameters and lengths, the pressure assumed being $\frac{7}{10}$ths of an inch. From this table it is seen how important a factor length of pipe is. Thus we find that a $\frac{1}{2}$in. pipe, 20yd. long, will supply seven lights. At 40yd. it will supply five lights, at 60yd. four lights, at 80yd. up to 100yd. three lights. The pressure on the pipes when all the lights are burning should vary as little as possible, and any excess of pressure is wasteful; hence the importance of regulating the sizes of pipes. Every gas consumer ought to know that every burner gives its best result at a certain pressure. Other sections treat on consumers' governors, pressure on upper floors, warehouses, gas-meters, fitting up cocks, underground pipes, gas-stoves and fires, ventilation, &c. The advice given on preparing contracts and the forms of specification and quantities are valuable. Messrs. James Stott and Co.'s little handbook will be a boon to the architect, and will save many mistakes in gas-fitting and lighting. It is published at the low price of 6d.

---

* Stott's Architects' and Surveyors' Handbook of Gas-Fitting. London: James Stott and Co., 174, Fleet-street, and Queen Victoria-street.

SPRUCE TIMBER FORESTS.

THE Maine forests are vast and magnificent, and may be estimated by riding through them for days together on the railroad; but those who are aware of the risk to which these forests are exposed by the opening of the great timber areas of northern Maine by rail, and the great destruction by fire caused to the American forests in the past by this means, entertain grave doubts of their safety. Wherever the path of the "iron horse" goes through the forests, the risk of a fire is great, which may sweep over township after township and destroy millions of acres of valuable timber. The *North-Eastern Timberman*, quoting the *Bangor Commercial*, says truly, "This is the menace of the future to our forest wealth," and can be guarded against only to a slight extent, as when it may happen no one knows, or where such a devastation would stop. The same journal speaks of another source of demand upon the forests—namely, "that of the great uses of spruce in the manufacture of pulp or paper stock." Formerly it was thought that only poplar and the finer fibre woods could be used for this purpose; but by improved machinery, spruce is said to be the chief dependence in the wood-pulp industry. In addition to this demand, the chemical-paper vats exhaust a large quantity. As the same authority points out, these requirements are sufficient to cause anxiety when it is calculated that, "at the present rate of consumption of spruce for paper-making, every spruce forest in New England will be stripped for profitable pulp-making trees in fourteen years." A report of the Labour Commissioner of the State of Maine gives some interesting facts as to this industry. He says: "In pulp-making, Maine is to-day in the very forefront; while paper manufacturing has become an industry of large magnitude. It is conceded by all paper manufacturers that spruce is the best wood for pulp, and Northern Maine is full of spruce, lying near its waterways, and easily accessible." The product is near the market, and New England will always be the centre of pulp and paper, as, of all States, Maine has the raw material in greatest abundance. American paper is finding a foreign market, and the export of Canadian spruce-pulp to this country is considerable; but of the duration of this pulp-paper there is some doubt.

FORCE OF THE WIND.

ON the 30th Oct., at the first meeting for the session of the City of London College Science Society, Professor Henry Adams, M.I.C.E., one of the vice-presidents, read a paper on "The Force of the Wind." After reviewing a number of the recorded experiments on wind-pressure, he tabulated the results upon a common basis to show that within certain limits the intensity of the pressure increased with the area of the receiving surface; but over large areas the maximum was not reached in practice, owing to the wind moving in concentrated gusts. An account was given of the pressure said to have been reached in various historical gales, and extracts from various standard works as to the proper pressure to be estimated for in designing structures. In conclusion, he suggested that, although 56lb. per square foot might be looked upon as the standard, this should be modified according to the circumstances of the case—viz., with the height from ground level, the unsupported width, and the angle of incidence. The pressures, according to the table submitted, varied from 16lb. at ground level to 80lb. at a height of 200ft., and in the latter case from 80lb. at a width of 10ft. to 40lb. at a width of 1,000ft., while the multiplier for angle varied from ·45 at 5° to 1·00 at 60° to 90°.

CHIPS.

A new convalescent house for female patients, erected at Murthly Asylum, Perthshire, was formally opened by Lord Balvaird on Saturday. A similar building is in course of erection for males, and the two are estimated to cost £9,000. The plans have been prepared by Mr. David Smart, Perth.

On Thursday in last week a new Primitive Methodist chapel was opened at Walton, near Peterborough. The chapel is of white brick, with stone dressings, designed by Mr. W. Hawkins, of Fletton, and built by Mr. Swain. The accommodation is for about 120, and the cost will be £300.

A stained-glass window has been placed in Sheldwich parish church, by the officers of the 11th Hussars, in memory of Lieut. the Hon. Herbert Miles, who died of enteric fever at Sialkot, India, in October, 1894.

Block III. of the Patent Office extension is fast approaching completion. The building is being erected for H.M. Office of Works from the design of Mr. J. Taylor, C.B. Mr. B. E Nightingale is the contractor. The floors and ceilings are fireproof throughout on the Mark Fawcett system.

On Saturday the memorial-stone of Heaton Moor Congregational church was laid. The cost of the church, which is to take the place of an iron building, together with that of the recently-built school, will be about £7,000. The church will seat ever six hundred persons, while the new school has accommodation for about 450.

The people of Weston-super-Mare have no fewer than three pier schemes engaging their attention at the present time—viz., the Knightstone Pier, which is being promoted by the urban district council in connection with two or three marine lakes and other improvements; the new low-water pier, which the present Pier Company are seeking powers to construct; and the Regent-street Pier, a Bill for which was obtained some years ago, and has not yet lapsed. On Saturday an extraordinary meeting of the present Pier Company was held to consider a report of the directors as to the construction of a low-water pier and other works, the raising of additional capital, to authorise an application to Parliament for powers to carry out the same, and for general business. The proposals were approved, and Mr. Yockney, of Queen Anne's-gate, S.W., was formally appointed engineer for the purposes of the Bill.

OBITUARY.

WE regret to announce the death, at the age of 62 years, of Mr. EDGAR PHILIP LOFTUS BROCK, F.S.A., F.R.I.B.A., the accomplished ecclesiologist and architect, which occurred at his residence, 6, Colville-square, Kensington Park, on Saturday. Mr. Brock had suffered for some months from cancer in the tongue, and underwent a painful operation in September last. He was, as a youth, a student in the Royal Academy Schools, and entered the offices of Messrs. W. G. and E. Habershon at the age of eighteen. When the brothers disconnected their practices, Mr. Brock remained as managing clerk to Mr. Edward Habershon, with whom he subsequently entered into partnership. The works of the firm of Habershon and Brock include Normanhurst Court, built for the late Thomas Brassey; master's house at Harrow, the laying-out of the Cawston Estate at Balham and the Manor Estate at Wellington, and similar works in Kilburn, Highgate, and Teignmouth. The most prominent work of the firm was, however, the numerous church buildings and restorations, the former including St. Augustine's, Highbury New Park, Hammerwood, Sussex, Wallington, Ore, and Hethersgill. On the retirement of Mr. E. Habershon, he left his share of the practice to Mr. Brock, who had since removed from Bloomsbury to Red Lion-square, and had carried out the various homes of the National Refuge Society, the German Orphanage, the Missionary College at Palestine-place, and many churches and schools. Mr. Loftus Brock had for many years held the office of honorary secretary to the British Archæological Association, and his extempore addresses in churches, given during the annual excursions (which were arranged under his supervision), were delivered in a lucid and popular style, and with an easy flow of language which brought home to the least informed members of these gigantic picnic parties the salient features and peculiarities of the buildings visited. He had also been the hon. secretary to the Society for the Encouragement of the Fine Arts since its foundation, and for many years had acted as cicerone at the excursions of the Kent Archæological Society. Mr. Brock joined the Royal Institute of British Architects as a Fellow in 1882, and at the time of his decease was serving as a member of the Committee of Literature. He was the author of many papers and essays on antiquarian subjects, and frequently lectured on similar topics. We gave Mr. Loftus Brock's portrait in our issue of Nov. 14, 1890.

MR. CHARLES BROWNE, F.S.A., whose death, at 21, Fellows-road, South Hampstead, occurred on Friday, was born in London in 1821. He was educated at King's College, London, and at Wadham and Worcester Colleges, Oxford, where he had a distinguished career. He was called to the Bar in 1846 at Lincoln's Inn, and practised at the Chancery Bar until a few months ago, when he retired through ill health, being, with one exception, the barrister of longest standing then in practice. Mr. Browne was a member of the legal council of the English Church Union from its commencement, an authority on ecclesiology and kindred subjects, and a member of many learned and scientific societies. He had delivered several lectures on antiquarian subjects before the Society of Architects, the St. Paul s Ecclesiological Society and other bodies.

MR. EDWARD LANE, the borough surveyor of Wokingham, died on Tuesday week, aged 68 years. He is survived by his wife, one son, and three daughters. The deceased, who had lived all his life in Wokingham, was for some years previous to the dissolution of the old local board inspector of nuisances and surveyor. On the constitution of the present town council he continued to hold these offices, together with the school attendance officership for the borough.

* * *

The town council of Reading are in correspondence with the Local Government Board with reference to an application from the council for sanction to borrow £8,000 to build an art gallery, and so increase the available space at the museum, where more room is needed to house the additional Roman remains constantly being found at Silchester.

Colonel A. G. Durnford, an inspector of the Local Government Board, conducted inquiries in the new Council Chamber, at Haslingden, on Tuesday week, relative to the application of the town council for power to borrow £3,100 for the sewering of Rising Bridge, and £1,700 for a new fire station to be erected near the municipal offices at West-view.

CITY GUILDS.—XII.: THE MERCERS' HALL STAIRCASE.

The black wainscot work of the handsome old hall of this the leading company, makes the interior of the famous building one of the most interesting still existing among the historic halls of the City of London; but, unfortunately, the apartment is so very dark that a photographic view is well-nigh out of the question, even during the clearest days in the summer. Mr. Sandell took a series of views for us; but the heavy shadows and absence of reflected light rendered the results scarcely so satisfactory as could be desired; indeed, the hall itself requires to be seen at night-time, when illuminated, to be properly examined in detail. The chapel occupies the site of the house of Gilbert à Becket, in which his son, Thomas, the murdered Archbishop of Canterbury, was born in 1119. We hope to give a plan of the premises when we illustrate the older portions of the buildings, at an early date, on which occasion some particulars of the history of the place will more accord with the illustrations. To-day we show the new staircase, which was erected about 15 years ago, when the façade buildings in Cheapside were carried out from the plans of the late Mr. G. Barnes Williams, the Company's architect. The interior fittings were designed by the late Mr. J. G. Crace, and executed under his supervision. The staircase is reached from the principal entrance in Cheapside by way of a floridly-treated vestibule in oak, carried up some 14ft. high, and above that the walls are hung with leather. The ceiling and cornice, in imitation of oak framing, are carried out in plaster. The area of the staircase is about 45ft. by 20ft. on the ground-floor level, and the height is about 40ft. The stairs are 8ft. wide, and have balusters with carved and fluted features, the newels being surmounted by sculptured lions bearing shields. One of these animals is seen in our accompanying view. The walls of the upper part of the staircase are lined with leather, and the oak frieze and cornices are relieved by gold and bronze enrichments. The lunettes are filled with three paintings, representing the Arts, Commerce, and Industry, the remaining compartment being occupied by a window. In the middle of the ceiling occurs a painting of Mercury by Barrias. This hardly comes into our present picture. Below, a great feature is made of the hall chimneypiece, erected in stone, under the middle landing of the grand stairs. We shall give before long an illustration of this part of the building, which is very picturesquely treated.

MESSRS. CHARLES JENNER AND COMPANY'S NEW PREMISES, EDINBURGH.

(For description, see p. 663.)

ALL SAINTS CHURCH, BELFAST.

This church is about to be erected in University-street, Belfast, and is designed to seat one thousand people on the ground floor, galleries being altogether avoided. The exterior facing of the church will be of white sandstone from Scrabo, and the interior dressings of red Dumfries stone. Mr. William J. Fennell, of Belfast, is the architect.

PASSMORE EDWARDS FREE LIBRARY, LOWER EDMONTON: CHARLES LAMB MEMORIAL.

This new public library, the free gift of Mr. J. Passmore Edwards to the town of Lower Edmonton, is about to be erected on the "Limes" site, at the corner of Plevna-street in Lower Fore-street, as a memorial to Charles Lamb, whose famous name is so prominently associated with Edmonton, where he lived and died. The land, which is being acquired from the Leathersellers' Company for the purpose, is situated close to the town-hall, and occupies in every way an advantageous position, central and convenient to the whole of the district. The building has been planned with a view to facility of administration and complete supervision; economy of working, necessarily in such an institution, being of prime consequence. On entering the building, beyond the vestibule, the reading and newspaper room, 40ft. long by 20ft. wide, will be found to the right, with ample windows towards the south and west, securing a cheerful aspect. To the left is the lending-library, with a long counter, and ample space for borrowers, divided only by an open arcade from the hall, so that the public can at once see from whence books may be obtained; and besides this great advantage, an uninterrupted view is secured from the attendants' counter direct into the public reading-room through the glazed screens in the arches on the other side of the hall. The old plan of inclosing the borrowers' counter by solid walls has been found a mistake, for the very good reason that thereby the officials are needlessly cut-off from the public part of the building, and their work of supervision and control is seriously impaired. Immediately at the end of the lending library is located the boys' room, completely under the eye of the librarian and his assistants, and well isolated, too, from the reading-room—which is a distinct gain. Facing the entrance at the other end of the hall is a wide stone staircase leading to a roomy gallery on the first floor, suitable for the display of local maps and charts, and forming an approach to the reference and magazine rooms, which are so contrived as to be under ready supervision. A space for the use of ladies is provided beyond the magazine-room, if required. On the second floor are placed the book-store, files, and mending-rooms, all in direct communication with the main departments below by spiral staircases. Lavatory conveniences are provided for the staff, but not for the public. Experience has shown that this is the best plan to adopt. The librarian's house has a private entrance from Plevna-street, and his comfort is provided for without excess of accommodation. The living-room is on the first floor, with three bedrooms, bathroom, &c. The kitchen and offices are in the basement, where likewise are the heating-chamber and fuel-place for the library, and shut off from the private apartments. The elevations are in red brick with stone dressings, and green slates are used for the roofs. The front is emphasised by a projecting porch of two stories in masonry. At the angle of the two main façades, and overlooking the two thoroughfares, a shield-like trophy, depending from the first-floor cornice, will be carved with the dedicatory inscription to Charles Lamb. Bas-reliefs will enrich the front elevation with portraits of Keats and Lamb. The commissioners will lay out the ground and inclose the site suitably with wrought-iron railings. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

PEW HILL HOUSE.

This house is being erected upon the site of an old house at Pew Hill, Chippenham, for Miss Dickson, sister of Sir John Dickson-Poynder, M.P. for the division. The house is built of Kingsdown and Hartham Park stone, and the roof is covered with green slating. In designing the house, an attempt has been made to combine modern requirements with the picturesque beauty of the Elizabethan stone buildings of the district. The work has been well carried out from the designs of the architect, Mr. T. B. Silcock, B.Sc., of Bath, by Messrs. Jacob Long and Sons, builders, of Bath, assisted by Mr. E. J. Trotman as clerk of the works. The drawing which we reproduce was exhibited at the Royal Academy this year.

BACON FACTORY, BRISTOL.

These premises have lately been completed for Messrs. Naish and Son, bacon curers. The shop-front is faced with Box Ground stone, and the factory at the back, with local Pennant stone. The interior of the shop has been lined with white and brown glazed bricks, the brown forming a dado with moulded capping. The interior woodwork and fittings are of pitch-pine, and the outside woodwork, teak. The whole of the floors are constructed with Stuart's granolithic fireproof flooring, except cellars, which are laid with Pennant paving. The premises have been adapted to the requirements necessary for the killing of 500 pigs a week, with pig-pens, sawdust-loft, boiler and engine-room, hanging-house, smoke-stoves, cellars, chill-rooms, lard and sausage-rooms, packing loft and stores, and provided with all the latest appliances and machinery for killing and singeing pigs, lard-refining and sausage-making, and refrigerating plant for chilling bacon. The building is lighted throughout by electricity, which was executed by Mr. A. S. Scull, of Bristol. The contractors for the works were Messrs. Hatherly and Carr, Bristol, the whole being carried out under the direction of Mr. James Hart, architect, Bristol.

FURNITURE FROM AMERICA.

Simplicity and good proportion are the leading characteristics of the modern American furniture, of which we herewith illustrate half-a-dozen examples from the designs of Mr. R. Brown, Jun., architect. Perhaps the most original piece is the Wall Table, suitable for a hall; the deep verge-shaped sides under table-top have a fresh and unhackneyed smack about them, to which the appropriate carving contributes in no small degree. The writing Bureau and upright Secretaire are both serviceable articles, and in good taste, the latter, when closed, occupying small space. The short Settle embraces a valuable locker-room under seat, while the piece of furniture, based on the design of our old livery cupboards, appears in a more interesting light by reason of a rather novel treatment of some of its parts. We are indebted to the *American Architect* for these subjects.

CHIPS.

New police quarters for single men have just been built at Watford, for the Herts County Council. Messrs. Clifford and Gough were the contractors, and the work has been carried out from plans by, and under the direction of, Mr. Urban A. Smith, the county surveyor.

Mr. Stephen Adam, Glasgow, on Saturday delivered the second of the series of Glasgow art lectures in the Corporation Art Galleries to a large audience, taking for his subject "Truth in Decoration."

The standing joint committee of Staffordshire are about to erect a new police-station in the centre of the city of Lichfield, under the superintendence of Mr. John P. Osborne, F.R.I.B.A., of Birmingham.

The County Council of Denbigh have raised the salary of Mr. Ellis W. Jones, district surveyor for Wickham, by £25 a year.

The death is announced of Mrs. Mary Anne Everett Green, who for the last thirty years has compiled the calendars of State papers in the Record Office. She had published thirty volumes of calendars, extending over the period from Edward VI. to Charles II. Mrs. Green, who was the widow of Mr. G. P. Everett Green, died on Friday last, aged 77 years.

On Saturday last the Belfast Industrial Exhibition, which was opened in April last, was closed. It has not been a financial success. There will be a loss of about £1,200.

A chancel screen in oak has been placed in St. Matthew's Church, Ipswich, as a memorial of the late Mr. D. H. Booth, mayor of the borough in the year 1881. The screen has been designed by Mr. John S. Corder. It is 12ft. 9in. high, and has a width of 14ft. 4in., is divided into seven bays, the centre one being much wider than the others and forming the doorway. The six bays flanking the doorway are filled in solid to about 3ft. 8in. from floor with carved and traceried oak panels. The screen is carved and enriched on both sides, and every panel, spandrel, and crocket is of different design. There are 102 spandrels, 97 crockets, 15 finials, and 56 carved cusps, all varied. The design was carried out by Mr. Fred. Bennett, builder, Ipswich, the carving being executed by Mr. John Groom.

Building Intelligence.

Ashton-upon-Mersey, near Manchester.—The foundation-stone of the schools in connection with St. Mary Magdalene's Church was laid on Saturday last. The architects for the schools are Messrs. Whitelegg and Whittaker, of 16, Albert-square, Manchester. The schools will accommodate 94 infants and 206 boys and girls in the mixed department. The infants' room will be 37ft. 8in. by 20ft., and the mixed school is 57ft. by 37ft. 6in. For school purposes, the mixed department will be divided by movable glazed screens into four rooms, which will accommodate 96, 44, 33, and 33 children respectively. There will be lavatories and cloakrooms for each department. There will also be a cookery-classroom in the basement 20ft. square, having its windows entirely above ground.

Boscombe.—The Bishop of Winchester consecrated, on Tuesday, the new Church of St. John the Evangelist at Boscombe, Bournemouth, which has been erected at a cost of about £14,000, to accommodate 1,100 persons. The site was given by Sir George Meyrick, the ground landlord. The church is built in the 14th century style of architecture, with a nave 107ft. long by 26ft. wide, north and south aisles of corresponding length, and 13ft. 6ft. wide. The building externally is of flint with Castle Cary bands and Bath stone dressings, and it is intended that there shall eventually be a tower and spire 150ft. high. The architects are Mr. J. Oldrid Scott, F.S.A., of London, and Mr. C. T. Miles, of Bournemouth. The building will be lighted by electricity.

Bury, Lancs.—The new Conservative Club was opened on Oct. 19. It has been designed by Mr. A. Hopkinson, architect and surveyor, of 15, Agur-street, Bury, and has been erected at the corner of Moorgate and Peter-street. The premises consist of a club proper and a steward's house. On the right of the entrance is a meeting room, 34ft. 6in. by 29ft., with platform for speakers. Adjoining there is a smoke-room. On the left of the entrance there is a reading-room, 19ft. by 13ft. The basement contains heating-chamber, and wine, spirit, and beer cellars. The caretaker's house communicates with the club. A pitch-pine staircase leads to the first floor, which contains billiard-room, 34ft. 6in. by 29ft., having an opén-timbered roof, and fitted with two tables; the steward's parlour, 15ft. by 14ft.; reading-room, 14ft. 6in. by 13ft., and a committee room, 13ft. by 12ft. The exterior of the building is faced with Accrington pressed bricks with Greetland stone dressings. Messrs. Thompson and Brierley, of Bury, have been the contractors for the brick, stone, and wood work.

Edinburgh.—A contract has been entered into by the Edinburgh and Leith Gas Commissioners with Messrs. Robert Bruce and Sons, Greenside-place, for the construction of the new chimney at the New-street works. The chimney, which is to be erected at the extreme southern boundary of the works, will be 250ft. in height from the ground level, with 23ft. of a foundation. It will rest upon a bed of concrete, 32ft. square and 7ft. 6in. in thickness, and at the base, where the stalk will be 11ft. in diameter, the ring will have a thickness of three and a half bricks, gradually tapering until at the top the thickness is reduced to one and a half bricks. The contract provides for the chimney being faced with terracotta brick, with stone bands at intervals, and for the top being of an ornamental nature, with a panelled arcading in stone or in buff brick. It is expected that the chimney will be completed in six weeks from the time work is commenced, which will be almost immediately. The cost of the chimney will amount to £3,490.

London.—All Saints Church, Norfolk-square, W., which was destroyed by fire rather more than a year ago, was reconsecrated on Nov. 1. The old walls have been in part retained, being coated externally with red brick. Entirely new arcades have been built considerably farther apart than the old, and the material for this and other dressings is terracotta. The roof is of Oregon pine and deal left unoiled and unvarnished. The slates are laid in concrete plaster in the manner introduced by the architect. The passages and chancel are floored with mosaic. The stalls and seats to nave, which are of somewhat Jacobean design, are of Padouk, a hard and fine red wood from Burmah. The principal feature of the outside is an ornate terracotta porch at the west end, with five gables covering three doorways and two recesses. The proposed terracotta belfry stage and spire have still to be carried out, as well as a carved oak canopy over the altar. At the east end of south aisle a morning chapel has been arranged on the site of the old gallery stairs. The contractors are Messrs. Perry and Co., of the Tredegar Works, Bow; and the architect is Mr. Ralph Nevill, F.S.A., of Chancery-lane.

Millbrook.—The new parish church was consecrated on Friday. The building is in the style of the Cornish and Devon churches of the 15th century. The chancel has a lofty arch, having on the north side a vestry and organ-chamber, and a chapel on the south side, with arches opening into the chancel and nave. The tower, the lower stage of which only has been built, is on the south side of the church. All the windows and doorways are of Polyphant stone. The pulpit, octagonal in form, is of traceried and carved work in oak on a base of Beer stone, made by Mr. Herbert Read, of Exeter, from the design of the architects. The altar, of similar treatment, has also been made by Mr. Read from the architects' drawings. Messsrs. Hine and Odgers, of Plymouth, are the architects.

St. Alban's.—The Herts County Council received a report at their quarterly meeting as to the progress that is being made with the new asylum just begun at Hill End, Beastney, near St. Alban's, from plans by Mr. G. T. Hine, of Westminster and Nottingham. The institution will cost, it is estimated, about £120,000, but at present the only contracts entered into are with Mr. Miskin, of St. Alban's, at £2,976 for foundations, another with the same contractor on a schedule of prices for the sinking of wells, and a third with Mr. Hallam, of St. Alban's, for the construction of an iron fence. The Great Northern Railway are making a siding to the site from the new station they are about to erect in the neighbourhood. At present the administrative department and accommodation for 560 patients is being provided, but the entire scheme will comprise 800 beds.

◆

The restoration of St. Mary's Church, Whittlesey, has just been commenced, under the superintendence of Mr. W. Cantwell, of that town.

The Kirk Memorial Evangelical Union Church, the foundation-stone of which was laid on Saturday, is situated at East Montgomery-street, Edinburgh. It is designed in the Early Perpendicular style, with nave and transeptal projections. The pulpit will be placed at the junction of the west transept and choir arches. The church is to be seated for 400, and the hall below will accommodate 200 persons. Vestry, session house, and classroom accommodation is also provided for. The architect is Mr. Hippolyte J. Blanc, A.R.S.A., of Edinburgh.

The water supply of Wotton-under-Edge is now complete. The engineer (Mr. Cotterill) visited the whole of the system last week, previous to handing a certificate to the contractor, Mr. S. Ambrose, releasing him from all responsibility. The waterworks are entirely in the hands of the rural sanitary authority of Dursley. The inhabitants have not only a good supply of water, but the work has been carried out at a low cost, the supply being brought into the town by the natural force of gravitation.

The mosaic which decorates the third cupola of the Escalier Daru in the Louvre (a portion of a general scheme of decoration) is now finished. The vault above the grand antique sculpture known as the Victory of Samothrace is thus decorated with four large figures upon gold grounds, representing the four great ages of ancient art, the Egyptian, Assyrian, Greek, and Latin, and, in four medallions, portraits of the great masters of those epochs.

It is proposed to construct an electric tramway from Blackpool to Fleetwood, the route to be from Talbot-road Station, along Dickson and Warbreck roads to Gynn; along the cliffs through Little Bispham, leaving the cliffs at Anchorholme, and following the road to Rossall; from thence across the fields to Flakefleet, in a straight line along the north-west side of the Copse-road into West-street, Fleetwood, and by way of North Albert-street to the Euston Barracks.

A memorial has just been placed over the remains of the late wife of Mr. H. G. Armstrong, of Heathcote, Wellington College, in the graveyard of the Church of St. John the Baptist, at Crowthorne. The pillar is a monolith of Dartmoor grey granite, treated as a four-holed West Country cross, moulded upon the upper part; none of it is polished, but the whole of the masoned faces are "double-axed." A curbing of the same material is laid round the grave. Messrs. Harry Hems and Sons, of Exeter, carried out the work.

Engineering Notes.

The Central London Railway.—The work of constructing subways beneath the space opposite the Mansion House in connection with the new underground railway will shortly be commenced. Plans have been submitted, and will be carried into effect by Sir Benjamin Baker, Sir John Fowler, and Mr. J. H. Greathead. The line will extend from Shepherd's Bush, where also the electric generating station will be erected, to Liverpool-street Station, the length of the double lines of tunnelling being six and a half miles; and there will be *en route* fourteen subterranean passenger stations, at depths varying from 65ft. to 70ft. from the ground surface. The motive power will be electricity. The line will consist of two iron tunnels, each 11ft. 6in. in diameter. These tunnels will be driven on the air-block system, although it is expected that the London clay will be continuous the whole way. There are only two short curves of three or four chains radius on the whole of the line, which may thus be regarded as practically straight; and the heaviest gradient against the load will be 1 in 100. The estimated outlay is £3,500,000. The metals will weigh 100lb. to the yard, and the road-bed will be made correspondingly stable. The carriages will each afford accommodation for 48 passengers.

CHIPS.

The Statute Labour Committee of Glasgow Corporation have agreed to recommend the erection of a suspension bridge for foot passengers over the Clyde at Oatlands Ferry or Polmadie, the exact site to be subsequently fixed.

In order to construct a new reservoir to hold 1,000,000 gallons of water, and to lay duplicate pipes to the source of supply, some miles from the town, the Yeovil Town Council have resolved to apply for a Provisional Order.

Extensive experiments are being made in the nave of Canterbury Cathedral, with a view of testing the possibility of overcoming the acoustic difficulties. Should they be successful, it is proposed to place a Dean Payne Smith memorial pulpit there, and to make increased use of the nave for special services.

A new church is about to be built for the Bishopsthorpe district of York. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect.

The Preston Town Council decided on Thursday in last week, by 37 votes, that the town clerk take all necessary steps to prepare and introduce in the next session of Parliament a Bill for powers to borrow a sum of £160,000 for training walls, dredging plant, dock equipment, &c., for the purpose of the Ribble undertaking.

Mr. Gascoigne Hastings Fowler Jones, architect, has been elected without opposition to the York City Council.

The Liverpool School Board have accepted a tender from Messrs. Thornton and Sons, amounting to £20,455, for the erection of new head offices at the corner of Sir Thomas-street and Cumberland-street.

The new Corporation Waterworks at Launceston were opened on Friday by the mayoress. The total cost of the works and pipes, and the acquirement of certain water rights and easements, has reached some £11,000 or £12,000.

With the view of further improving the tramway service in Glasgow, it has been decided to inaugurate through rates between the northern and southern and the eastern and western extremes of the city. It has also been resolved to acquire ground at Dennistoun terminus sufficient to allow of the erection of stabling for 350 horses and the necessary complement of cars.

The Duchess of Teck will attend St. Luke's Church, Kingston-on-Thames, on Saturday in next week, the 16th inst., on the occasion of the dedication by Dean Hole of three chancel windows to the memory of the late Lady Wolverton.

The annual dinner of the Peterborough Branch of the Operative Bricklayers' Society was held at the Bell and Oak on Tuesday week, Mr. J. W. Walshaw, borough surveyor, being asked to preside. Among those present were Mr. W. Hill, president, and Mr. R. Lusford, secretary.

A memorial bust of the late Sir Jerom Murch, seven times mayor of Bath, was unveiled on Tuesday week by the Mayor of Bath. The bust, which is a replica of that now in the Royal Literary and Scientific Institution, has been placed at the north end of the principal corridor leading from the old to the new council chamber in the Municipal Buildings.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—The second meeting for the current session was held at the Exchange Buildings on Friday evening, the President, Mr. William Henman, in the chair. A lecture, illustrated by 120 lantern views, upon "Robert Adam and His Style," was given by Percy Fitzgerald, M.A., F.S.A. Robert Adam was, he said, one of the great architectural reformers, and about the middle of last century succeeded in completely displacing the old conventional style which had been in fashion "since the days of Bramante," the style of Colin Campbell, Kent, and others, and in exhibiting his own. He became almost sole architect, and engrossed all the business. At this hour every quarter of London is full of his work. No architect ever built so much. Adam was more an artist than an architect. No one can compare with him in the brilliancy and versatility of his gifts. He excelled in all departments. He built noblemen's palaces, mansions, churches, theatres, squares, streets, all in profusion. His decoration was of the most brilliant kind—always architecture in relief—it belonged to the structural forms of his building. His ceilings are marvels of fanciful grace, with groups of figures, elegant patterns, festoons, vases, &c. He designed hundreds of marble chimneypieces, executed by first-rate sculptors. His ironwork is to be seen everywhere in London, in balconies, railings, fanlights, and especially his noble staircases in mansions of degree. In furniture of all kinds his patterns are exquisite, some his cabinets rivalling work of Reisner. This department alone would have engrossed the time of another man. In Mr. Heaton's sumptuous volumes Adam's few specimens excel all the others in the grace and tone of "distinction." His ornaments in the precious metals and in gilt brass, his door furniture, walking-cane tops, cruets, cups, &c., all show the same grace. He, in short, recalls one of the old Italian artists, who were architects, painters, goldsmiths all in one. The principles of Adam's style seem to be these:—1st. His elevations are pictorial in character and fall into pictorial lines. 2nd. He always sought "movement" in his front—that is, he strove to excite speculation and set the mind of a spectator in motion. 3rd. He put emphasis and feeling into solitary architectural elements—such as a column, a patera, an arch. He thought the regular column too gross for his purpose, so he reshaped it, tapering the shaft and reducing the size of his capital. This accounts for the curious, unusual look of the Adam porches, &c. 4th. He discovered a new material, the famous Adam's stucco, which had extraordinary endurance, and seemed to grow sharper and more bleached and harder with every year. He required this material for his extensive decorative operations, and it harmonised better with common "stock bricks" than stone would. He used it profusely for his outside ornamentations, his theory being that ornamental carvings in the open air should be as refined and delicate as that on one of his chimneypieces. The gate at Sion House is as finely wrought with flowers and garlands as though it were under cover. His theory was that the spectator would be attracted and come up close to examine it. It was his fashion to use a delicately-wrought oval or patera or tablet on a waste of wall, to the same end. The stucco lent itself to all these designs, being flexible as well as durable. 5th. Fine workmanship, spacious and dignified treatment, wide halls, broad windows, characterised all his work. These qualities are all displayed in his palaces built for the nobility. They are all, without exception, beautiful and original, and most interesting to the architect. Such are Osterley at Brentford, Sion House at Isleworth (restored and remodelled), Lansdowne House, Kenwood, Luton, Keddlestone, and many more in Scotland. In St. James's and Portman Squares there are many magnificent interiors, the spacious chambers arranged in original unexpected fashion, though outside it seems an ordinary "three-windowed house." All his rooms are charming, and he delighted in contriving little chambers, octagon and circular, with a domed room. His ceilings are covered and broken up with intersecting arches and cornices; he separated rooms by open colonnades, or he would curve his dividing wall, placing a straight cornice in front supported by a couple of columns. His system of decoration was quite unique and original, and a mansion set off with his rich ceilings, decorated walls, and sculptured chimneypieces is a thing to see. This decoration, which was of the most elaborate and florid kind, was really pictorial, and was no more than Arabesque or Grotesque, as he styled them, designs put in relief. Adam was really responsible for all these, though he was assisted by Pergolesi, an artist of note, who has published his own designs, which are far inferior to those of Adam. His staircases were very stately and beautiful, of the "flying" order mounting, a lantern in the roof. In the Duke of Leeds's house in St. James's-square—now a Government office—there is really a lovely stair, a broad oval in shape and mounting with oval galleries. Here, and in the galleries that it led up to, he displayed his choicest ironwork, interlaced lyres and urns. In these things there was the most abundant fancy and no repetition of subjects. It cannot be repeated too often that this fancy seemed inexhaustible in its resources, and was displayed in elegant forms. The marvel is that such a man should be so persistently overlooked, and with so many of his great works amongst us. He, as he had said, designed everything himself, and he was assured by the owner of the Watkyn Wynn Mansion, in St. James's-square, he literally designed everything in the house down to the cruet-stands. A walk through London will reveal innumerable "knockers," all conceived in the most elegant and airy manner; a handle on the writer's door is simply perfect as a bit of design and proportion. He was certainly a remarkable man—a great artist; as the grotesque George Robins used to say of every bit of property he put up, "Gentlemen, here tact and propriety preside!"

Manchester Society of Architects.—The members of this society held their annual *conversazione* on Friday evening at the City Art Gallery, Mosley-street. After a reception by the President (Mr. John Holden), the guests proceeded through the various galleries, and had an opportunity of seeing the autumn exhibition of pictures, the permanent collection, and a number of architectural drawings and trades exhibits. The architectural drawings were shown in the lower galleries. They were the contribution chiefly of members of the society and other architects in Manchester and the district. The trade exhibits comprised contributions by Mr. William Morris (London) and others.

Sanitary Inspectors'. Association. — The first monthly meeting of the members of this association was held on Saturday evening in the Carpenters' Hall, the president, Sir B. W. Richardson, occupying the chair. Mr. Henry Thomas, chief sanitary inspector of Bermondsey, delivered the annual address, in which he dealt with a variety of sanitary questions relative to the best means of effecting a permanent improvement in the general public health. Having urged the necessity of better sanitary measures for the protection of barge and canal boatmen, whose living and sleeping accommodation, he contended, should be above deck, Mr. Thomas adverted to the question of providing more and better markets in the Metropolis. He considered it highly desirable that municipal markets should be established in every Metropolitan district, where the country's produce could be sent to a responsible appointed official for distribution to the public, which would be a guarantee that the producer would have fair value for his produce, and the consumers would get fair value for their money. This officer should be an independent official under the control of the County Council. Mr. Thomas further advocated better provision for the lodgment and sanitary care of the thousands of poor people who annually left London for the hop-picking season. The president, in moving a vote of thanks to Mr. Thomas, characterised the paper as a highly practical one, replete with suggestions that were not only worthy of careful consideration by all who were engaged in the work of endeavouring to improve the public health by the institution of a better system of sanitation, but which, he hoped and believed, would ere long be adopted by the sanitary authorities of the country.

◆

The Leeds Corporation will consider to-morrow (Saturday) a recommendation from the tramways sub-committee to request Dr. Hopkinson, of Westminster, to prepare a report upon the proposed experiment in electrical traction in the city. The idea of the committee is to try the overhead system of electrical traction from the Canal Gardens, Roundhay, to the junction of Boar-lane and Briggate, the conduit electrical system along Boar-lane as far as the Queen's Hotel, and the overhead system along Wellington-road on to Kirkstall.

COMPETITIONS.

Belfast.—It seems, from accounts which have reached us concerning this much-talked-of Irish cathedral competition, that, owing to difficulties in connection with the project, the committee will intrust the work to an architect to be chosen without any competition whatever. Particulars are promised for publication after Friday in next week, the 15th inst. At present it is not exactly stated what the hindrances to the original intention actually are.

CHIPS.

The Marquis of Londonderry recently visited New Seaham, county Durham, for the purpose of opening new club premises for members of the local Conservative Working Men's Association. The club, which is faced with brick with stone dressings, has been erected from designs by Mr. Robert Currie, chief engineer at New Seaham Colliery, who also superintended the masonry and joinery. It has been built and furnished by the Marquis at a cost of about £1,200. Two similar institutions have been built by Lord Londonderry—one at Seaham Harbour, and the other at Silksworth, whilst a fourth is being erected at Rainton. The total cost of these buildings is nearly £6,000.

The report on the Manchester Ship Canal has just been issued by the corporation engineer, Mr. G. H. Hill. He estimates that there is a balance of available capital of £239,000; but the whole of this will be immediately required. The progress of the works in hand has been satisfactory. The new warehouses and hydraulic and electric-light installations should be completed by the end of the year. Nearly all the roads round the docks have been paved, and additional sidings and railways laid down. The dredging difficulty is still most serious, and he recommends that all savings should be applied to that object. The increasing traffic will also require further expenditure on equipment.

If the amount of building in a city is an evidence of prosperity, and no doubt it is, Chicago must be enjoying a return of good times. During May, June, July, and August permits were issued for the erection of 3,495 buildings, with a frontage of over 17 miles. The cost will reach £4,000,000 sterling. In 1894 permits were issued for the same four months to the amount of £2,380,000 and in 1893 for £1,530,000. The Windy City seems to be growing.

The annual meeting of the Scottish Building Trades Federation has been held in the Building Trades Exchange, Gordon-street, Glasgow. There was a large attendance of representatives from various parts of Scotland, the following places being represented:—Aberdeen, Alloa, Dumfries, Dundee, Edinburgh, Falkirk, Glasgow, Kilmarnock, Motherwell, Perth, Arbroath, &c. Mr. David Heron, builder, Edinburgh, president, occupied the chair. The secretary read a report by the executive on the progress made in promoting the federation throughout the country, and afterwards read a paper on "Federation: its Objects and Advantages." It was resolved that the next half-yearly meeting be held in Glasgow.

The directors of the Portsmouth, Meon Valley, and Alton Railway Extension Company have held a meeting, at which it was decided that the financial support already accorded to the project justified them in proceeding to allotment. The promotion of the Bill will be proceeded with in the next session of Parliament, and Sir James Szlumper and Mr. Gravell, the engineers for the line, have been instructed to proceed at once with the requisite Parliamentary plans and surveys.

St. John's Church, Redlands, Bristol, was reopened last week after having been restored at a cost of £680. The works include new pulpit and choir stalls, the panelling and decoration of the roof of nave, and frescoes on the walls, and a reredos will soon be added to the fittings. Mr. H. V. Gough, of Bristol, was the architect, and the carving has been executed by Mr. Margetson, of London, and the decorative works by Messrs. Joseph Bell and Sons, of Bristol.

New board schools in Manor-road, West Ham, were opened last week. They will accommodate 1,576 children. The design, although in the main on the lines of the schools most recently opened, marks a departure therefrom in the arrangements of the cloak and teachers' rooms, and of the entrances to the several departments. Passages are entirely absent, access to the three departments and to the classrooms therein being direct. A building, comprising laundry and cooking-room, has been provided adjoining the caretaker's residence, whilst provision is also made for manual instruction in a separate building in rear of the schools, this being the first building specially erected for this purpose by the Board. There are covered playgrounds for each department. The cost of the schools, including furniture and fittings, is £20,120. Messrs. Newman and Jaques were the architects.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Balabhaig, State Engineer, Gondal, India. (We have received the photograph of the Grassia School, with thanks; but it has been so damaged in transit as to be of no use whatever for illustration.)

Received.—E. Flaxman.—C. R. P.—C. W. (Bootle).—R. J. and Co.—Decorator.—A.R I.B.A.—G. P. and Co.

Correspondence.

THE HALL OF THE MERCHANT TAYLORS' COMPANY.

To the Editor of the Building News.

Sir,—The descriptive account of the Merchant Taylors' Company's premises in Threadneedle-street in your last issue fails to do justice to the memory of an eminent man, the late Mr. Edward I'Anson, for many years surveyor to the company, whose genius largely contributed to mould the company's hall and its surroundings into the form it now presents to the eye. One turns in vain to the bulky volume compiled by a late past master of the company, Mr. C. M. Clode, entitled "Memorials of the Merchant Taylors' Company," for any recognition of the hand by whose care the hall was for many years preserved and adorned, although every other officer connected with the hall, down to the beadle, are carefully noted, and their services to the company duly recorded. As an old pupil of Mr. I'Anson, and as having been closely associated with him in business for many years, I should like, with your permission, to supplement your account of the hall with a few facts, and recall the services to the company of a man who did little to advertise himself.

The ceiling of the hall shown in your illustration was designed by Mr. I'Anson, who at the same time designed a scheme of colour decoration for the walls and ceiling, which was carried out (I think) by the late Mr. Crace, and traces of which yet remain. When the company resolved to add this ceiling, which replaced a plain matchboarding ceiling painted drab, it was proposed to intrust the work to Mr. Philip Hardwick, who carried out the western corridor and the offices next Threadneedle-street, the surveyor to the company not being employed on architectural work; but Mr. I'Anson having appealed to Mr. Hardwick to be permitted to carry out the ceiling, Mr. Hardwick, in the handsomest manner, relinquished the commission into the hands of his younger *confrère*. In order to illustrate his design, Mr. I'Anson had a perspective drawing made of the interior of the hall by Mr. George Truefitt. This drawing was lithographed, and published by Messrs. Day and Son, and is reproduced in Mr. Clode's book at p. 39; but, of course, without acknowledgment.

The very graceful stone screen in the eastern corridor was designed by Mr. I'Anson, the carving by, I think, Mr. Earp, from drawings by the architect. In this work the designer is seen at his best, Mr. I'Anson, like his great co-temporary, Sir Charles Barry, being essentially a Classic architect.

The south corridor, with a series of stained-glass windows illustrating the memorable squabble and reconciliation between the Merchant Taylors and the Fruiterers, was also Mr. I'Anson's work, in which he was not so successful, the style being unfamiliar to him. He also designed the other additions in the great garden, which are not shown in the plan published in the Building News, which plan, if I am not mistaken, was prepared by Mr. I'Anson.

It may be noticed that the hall does not appear to have been destroyed in the Great Fire, although it was injured, and the company's plate melted. The hall was partially rebuilt by Jarman, the City Architect, who made use of the old walls, as is evident from the plan, which is entirely a Mediæval one, and the irregularity of the angles of the building, none of which are rectangular.—I am, &c., John Hebb.

MR. PENROSE ON COMPETITIONS.

Sir,—The observations of the worthy President of the Institute on Monday night must commend themselves to many a competing architect who, although he has tried and tried again, has not by any means so frequently succeeded. There is one point which seems worthy of mention about the West Ham competition to which Mr. Penrose did not refer in detail—viz., this: Seventy-five architects submitted designs, and only three received any reward for their trouble. Upon the preparation of their plans some spent two months, and some, no doubt, spent more. Taking, therefore, an average of two months for the 72 remaining competitions, the grand total of twelve years was actually consumed upon work which was absolutely of no use whatever to those who took part in the proceedings. And yet this is acknowledged to have been one of the most satisfactory competitions of recent years.—I am, &c.,

An Old Tee-Square.

HOW THEY DO IT IN THE NORTH OF ENGLAND.

Sir,—In a short time advertisements will doubtless again appear for tenders for a new convalescent home at Grange-over-Sands, and as advertisements for the same object so recently appeared over my signature, I trust you will allow me space to explain why that will not be the case this time. I was appointed by a committee of the North-Eastern Counties' Friendly Societies' Convalescent Home, Grange-over-Sands, architect for their proposed new building at a commission of 5 per cent. on the cost, including the time and expenses of six journeys from here to Grange for the purpose of inspection during the progress of the works. Although this is not actually according to the letter of the schedule of charges issued by the R.I.B.A., I think members of the Institute would be justified in making such an abatement, considering the benevolent purposes of the institution.

After inspecting and taking levels of the site—one by no means favourable to strictly economic building, being a very steep limestone hillside—I got out preliminary sketches, which, after being thoroughly examined by the president, the secretary, and one of the trustees of the body, were approved by them. They ordered me to prepare the working drawings, and to lay them before the building committee in the pencil stage. I did so. They also were thoroughly gone through, the committee expressed themselves well satisfied with them, and I was told to complete them, write specifications, and obtain tenders by public competition. Mr. Neilson, surveyor here, was commissioned to take out the quantities, and the tenders were opened at a meeting at West Hartlepool five weeks afterwards.

The building was designed to accommodate 34 patients, and the administrative block was large enough for the addition, at a future time, of a wing similar to that already provided, and making a total of 68 patients. The lowest estimates amounted to £4,055 in separate tenders, as is the general custom in the North. As the committee came to the conclusion that they were not justified in beginning with the money they had then in hand, an adjournment of five weeks was resolved on, during which the different lodges were to try to raise the balance of the amount by present loans of their lodge funds and by other means.

Between these two meetings the plans, which I had intrusted to the president at his request, were taken over to Grange by him. This is apparently a perfectly legitimate action, but it has an important bearing on the sequel. I attended the adjourned meeting with a scheme I had prepared for a deduction of £750 from an already cheap building (considering the site), one intended to be substantially, but very plainly, built of stone mainly from the site, and which comes out at 3½d. per cube foot. I consulted the president about my presence at the meeting, and he told me he would call me in if they wanted me. I never was invited in, and I learned only from a delegate whom I accompanied back to Darlington that, after a wild and heated discussion, my plans had been rejected, and nothing further had been decided. The only notification in black and white of this particular fact, so exceedingly important to me, that I have ever yet seen was in a paragraph in a local paper. I may say here that the committees are mainly composed of working-men, having only a slight mixture of other persons with broader ideas and a grasp of business matters.

A fortnight afterwards, on the invitation of one of the trustees, I attended another meeting, at which sundry questions were put to me. The first two or three referred to a proposed scheme for a home for 30 patients, with administrative accommodation for 60, to cost not more than £2,500, which I offered to do on the same terms as before, at the same time promising a subscription of £20 to the funds from benevolent motives, and in consideration of the failure of these many thousands of men to raise a few hundred pounds. The last question, being such a good one, I must give in the exact words before me, viz:—"In the event of the second plans being accepted does it clear us from any previous obligations?" Here, then, is a body of men who, in their corporate trade capacities, will paralyse a whole country side rather than take a reduction of wages, coolly asking an architect to sacrifice the whole of his wages for one job on condition that he gets another of an inferior character. Although I knew I was treading on soft places, as I had heard on good authority that an architect had offered, at the very outset, to do the work at 2½ per cent., I was determined to hold out for the custom of the profession, and I claimed 3 per cent. on the lowest tenders, as per rule 9 of the schedule. As a consequence of this I got a letter from the secretary, this time informing me that, "on the face of my reply to this question," my terms were not accepted.

I now hear that an architect, or at least a man who draws plans, from somewhere in the neighbourhood of Grange, has been commissioned to carry out the £2,500 scheme, including quantities, and also supervision at least once a week, for 4 per cent. on that sum. This action seems very inconsistent for a committee of men who mostly have such hostile feelings against those people whom they choose to dub "blacklegs." I took pains to impress upon them that in what I was doing I was endeavouring to act as nearly as possible up to the principles laid down by the heads of the profession. I hope it will turn out that the man who is now engaged is not a *bonâ fide* member of our craft, but is merely one of those persons who are able, in the present state of public opinion, without any real qualifications, to call themselves architects.

As the president, at the last meeting I mention, produced tracings showing the new scheme, I take it that the matter was arranged soon after the opening of the tenders, or about the time of the journey of the plans to Grange. In this way, then, another man was substituted for me without giving me the chance of explaining the deductions I could make, and of refuting some objections now made to a few of the minor details affecting the interior working, trifles which would have saved merely a few pounds, but which are analogous to the proverbial "ha'porth of tar."

I have confined myself mainly to a statement of facts; more will be known in the future about the underhand working, owing to the public nature of the job.

I am sorry to intrude my personality so much upon you; but as my position has been so lately publicly announced, I am bound for the sake of my reputation to let the public know the reason for so sudden a change. I look upon it also as a case interesting to architects generally, bearing, as it does, on the so often discussed question of their remuneration, and on the contemptible methods pursued by some to the pecuniary detriment of the remainder. These reasons must be my apology for asking you to be kind enough to insert so long a letter.—I am, &c.,

W. T. Aggutter.

7, Horsemarket, Darlington.

HOTEL COMPETITION, WEYMOUTH.

Sir,—Having replied to the advertisements in the professional papers for above-named competition, we received in compliance with our application a plan of the site and one sheet of conditions, the only information given with regard to the accommodation required being to the effect that "the building should contain, in addition to the usual rooms and offices of a first-class modern hotel, a hall or saloon capable of dining not less than 150 persons at one time."

We wrote to the town clerk asking for further information—i.e., what number of bedrooms would be required? What accommodation would be necessary for the staff and manager? Whether public bars and a buffet would be required? Whether it was intended to use electric light, and, if so, should a dynamo and engine-room be provided, and whether the stipulated cost of £17,000 should include the electric plant? Whether the buildings should be of fireproof construction? Whether stables should be provided, and, if so, what accommodation? We also asked for information with regard to the various levels of the site, the positions and levels of the sewers, and whether any ancient lights existed, which should be regarded in the preparation of the design.

In reply, we received a further site-plan, with the information we sought shown thereon, and the position of certain ancient lights to be considered were also roughly indicated. Surely such important information should have been issued with the conditions!

We were also informed that the whole accommodation would be left entirely for "the competitors to make the best arrangements possible with the money available."

As the whole design would depend upon the accommodation to be provided, and the building would vary in proportion according to the elaboration introduced, we fail to see how a scheme could possibly be prepared with any satisfaction to its author.

We presume that it will be necessary for the "professional referee who will advise the Council as to the relative merits of the designs, &c., admitted to the competition, and make a selection in accordance with the conditions," to know what accommodation will be required, otherwise we feel it would be impossible for a satisfactory selection to be made by the assessor, and surely under these circumstances it would have been right and proper to have acquainted all the competitors with the views of the Council, and have given similar information to that which the referee must necessarily acquire previous to his inspection of the designs and his award being made.

We very much regret that the conditions of this important competition should have been so unsatisfactorily prepared, and we feel sure that no architects who value their time will risk preparing a design from such ambiguous conditions, and no doubt the Council will find a lack of competitive designs both in number and quality.—We are, &c.,

Clark and Hutchinson.

28, John-street, Bedford-row, W.C.

PEMBROKE DOCK INTERMEDIATE SCHOOL COMPETITION.

Sir,—It may further interest "A Competitor" to know that the plans he refers to required no such modification as he seemed to imply; but were "far and away" nearer to the governor's views than those of himself. And, more, the Mr. ——— was a complete and perfect stranger to the governors and the clerk.—I am, &c.,

Verity.

GRAVEL ON ROADS.

Sir,—Through the medium of your journal I would suggest the following to the vestries and road surveyors of towns.

I believe if, in place of throwing down gravel, shingle, or grit, to prevent the slipping of horses, crushed limestone was tried, it might answer much better, and be an immense saving in wear and tear of the horses' feet and the roads.

The sawing and cutting of hard rock is performed by the aid of reciprocating toothless blades of iron fed with water and grit.

The gravel as now thrown down is brittle, and breaks up with glass-like edges, which, being pressed with the iron shoes and wheels, terribly cuts away the roads and horses' feet.

As chalk is usually used to prevent slipping, I would suggest that a trial be given to crushed hard mountain limestone, as produced by thousands of tons in Derbyshire for road metal.—I am, &c.,

W. Brindley, F.G.S.

THE "SCIENTIA" WATER-CLOSET APPARATUS.

Sir,—Referring to your illustrated article on the above in last week's Building News, can the patentee explain how it is proposed to treat the apparatus when there is a window in the wall directly behind the w.c., and also how the ventilating shafts are arranged when there is a series of closets vertically over each other?

As to the "economy of space," I take it that in London and in all large centres the battle is very much to him who can get the most accommodation in a given area, and this *multum in parvo* arrangement of an apparatus may point in the right direction for one department of our buildings.

Then as to ventilation, every observant man knows that when we open a w.c. window, the colder and heavier air of the outside rushes in, and at the least but dilutes the odours of the closet, driving them into our pantries, larders, and every nook and cranny of the house—not forgetting the lungs of the inmates—when they are ultimately persuaded by the fires to make their exit at the chimneys.

If you could give a section through the apparatus, it would make your interesting article still more explanatory and useful. Inclosing my card—I am, &c.,

Nov. 4. A London Architect.

◆

At a special meeting of the shareholders of the Lancashire, Derbyshire, and East Coast Railway Company, held in London on Monday, the chairman announced that early next year coal would be carried over a large portion of the system, and at the end of the year nearly the whole of the railway would be completed.

A new Wesleyan chapel is to be erected at Birkenhead, to take the place of Low-street Mission Room. The new building is to include accommodation for 300 people, with classroom, vestry, kitchen, &c. The walls are to be of grey local bricks, with pressed-brick dressings. The cost is estimated at £1,000, exclusive of furnishing. The work will be carried out from the designs of Mr. T. Taliesin Rees, A.R.I.B.A., Birkenhead.

At Harrogate, on Wednesday week, Mrs. Boyd Carpenter laid the foundation-stone of a church which is to take the place of a mission room in the Smithy Hill portion of the parish of Christ Church. The total cost of the building, without the tower, will be £8,000, and the amount subscribed is £4,025. The style will be the Later period of Decorated Gothic. The design consists of lofty nave, chancel, north and south aisles, south chapel, double transepts, organ-chamber on the north side of the chancel, and vestries for the choir and clergy. A tower and spire are designed for the west front, which is towards Walker-road; but only the lower stage will be built for the present, and this will form a baptistery. The church will accommodate 850 persons.

Trinity Church, Limerick, was reopened for Divine service on Sunday, October 20, after undergoing several extensive improvements, among which may be mentioned that the old gasfittings have all been removed, and beautiful specimens of art metalwork in iron and brass take their place. Suspended from the chancel arch hangs a brass corona with nearly forty lights. A brass lectern, presented by the widow and family of the late Mr. Charles Evans, bearing a suitable inscription, has a prominent position in front of the chancel. The above metalwork has been manufactured by the celebrated ecclesiastical furnishers, Messrs. Jones and Willis, of Birmingham, London, and Liverpool. The whole of the work was carried out from the designs and under the superintendence of Mr. Robert Fogerty, architect, Limerick.

Intercommunication.

QUESTIONS.

[11444.]—**Moment of Resistance of Corrugated Steel Floors.**—Will any reader kindly give me particulars and formulæ for calculating the moment of resistance of corrugated steel floors, as used in railway bridges? 1. The span and loading being given, find the M of R of required floor? 2. The section of floor being given, find its M of R?—E. Bond.

[11445.]—**Ivy on Walls.**—Should be glad to know if any reader could tell me about the effects of ivy being allowed to grow on brick or stone walls. Have heard so many conflicting statements, some authorities saying that ivy tends to weaken or destroy the wall and mortar, and also helps to keep walls permanently damp; whilst others contend that it forms a protection to walls against rain, &c., and keeps the walls dry.—Oberon.

[11446.]—**Cement Castings.**—Can anyone kindly tell me of a cement that will set quick, suitable for casting, and will not expand?—Enquirer.

[11447.]—**Cleaning Carved Stonework.**—Will any reader inform me the best way to clean dirty carved stonework?—X. Y. Z.

REPLIES.

[11443.]—**Oil Gold.**—The specification should have been "the best oil gilding" that is gilded in oil-goldsize, distinguishing it from "water gilding," or gilding on water-size with vellum, which is the material used for burnish gilding.—Tho. Bottomley.

◆

CHIPS.

Major-General H. D. Crozier, R.E., held an inquiry at the Town Hall, Stoke-on-Trent, on Thursday in last week, with respect to an application by the town council to borrow £2,246 for purposes of street improvement and sewerage, including £486 for improvements to the Trent Bridge, £150 for sewering Lytton-street, £90 for a palisading by the canal in London-road, and £1,520 for a proposed new road to Basford.

It has been decided to enlarge the chapel at Llansaintffraid by extending it frontward, and erecting a new elevation of red pressed bricks. The work has been intrusted to Mr. T. Taliesin Rees, A.R.I.B.A., of Birkenhead.

A richly-stocked deposit of ancient manuscripts, preserved since 1677, has been discovered in the cellars of the Edinburgh City Chambers. Nearly all the papers are of the first importance, and they include 136 letters from the Duke of Montrose and other noblemen and gentlemen in relation to the rebellion of 1715.

The Metropolitan Asylums Board, on the recommendation of a special committee, have decided to appoint a surveyor at a salary of £400 a year. The duties of the new officer will be to prepare plans and specifications for, and to superintend the erection of, all painting and cleaning works, repairs, and alterations, and additions at the several institutions on land under the control of the Board. His professional advice and assistance are to be at the disposal of the clerk to the Board in all matters relating to the work of the Board, and he will be required to devote the whole of his time to the service of the managers.

St. John's Roman Catholic Church, Port Glasgow, was formally opened last week, after being partially rebuilt. The church is designed in the Early Decorated style, and consists of nave, chancel, transepts, side chapel, baptistery, sacristies, &c. The new altar, which is one of the finest in Scotland, cost £500, and the total cost of the reconstruction was £6,000.

The collection of portraits of celebrities at the Royal College of Surgeons will shortly be added to by a bronze bust of the late Sir Richard Owen, which is being executed by Mr. Alfred Gilbert; and a marble bust of the late Sir William Savory, the work of Mr. H. R. Hope Pinker.

The London and North-Western Railway Company have decided to erect a technical institute at Bangor, at a cost of £1,800, for the use of their employés in the Bangor district. The institute will include classes in various subjects, and will have a room for concerts, &c., to hold 400 people.

In the case of the application for discharge from bankruptcy made on behalf of William Parker, of Somerset-road, Brentford, builder and contractor, the discharge has been suspended for two years, ending October 4, 1897.

The free library which Mr. Andrew Carnegie has given Pittsburg was dedicated on Tuesday. The erection of the library buildings, with the music hall, museum, art galleries, and four branch libraries, has occupied three years, and cost 1,000,000dols—the sum for which Mr. Carnegie drew his cheque at the beginning.

Mr. Pittendrigh Magillivray, A.R.S.A., Murrayfield, Edinburgh, has completed his colossal statue of Burns for the town of Irvine. The work was inspected by the committee on Saturday last.

Legal.

IMPLIED WARRANTY.

A NEW and very important point indirectly arising out of the Employers' Liability Act arose and was decided for the first time, in the recent case of "Mowbray v. Merryweather" (*Times*, Oct. 30) by the Court of Appeal. It is of practical interest to builders and contractors in regard to their responsibility for defective plant, although this dispute itself was concerned with shipping. The plaintiffs were stevedores, and were employed by the defendant, the owner of a steamship, to discharge a cargo of deals in port, the bargain being that the defendant should supply all necessary tackle and gearing with which the work was to be done. While the plaintiffs' men were using a chain so supplied by the defendant, who, of course, knew what strain it would be required to stand, it broke, and one of them was injured. He accordingly brought an action for damages against his employers, the present plaintiffs, under the Act, basing his claim upon this defect in the plant, owing to the negligence of the plaintiffs, or their servants, in not having first examined the chain. The action was settled by payment of £125, which the plaintiffs now sought to recover from the defendant as damages for the breach of his implied warranty that the chain he had supplied them to use in discharging his cargo was fit for its known purpose, and they got judgment before Mr. Justice Charles.

Upon the appeal the Master of the Rolls confirmed this ruling, and laid down the law very clearly. He had no doubt whatever upon the point, although it was now determined for the first time. The defendant, when he supplied the chain, knew well what it would be used for, and so his breach of the implied warranty of fitness for its purpose was clear. But he must also be taken to have known that if the chain broke while being used by a workman in the plaintiffs' service he would be injured, and they would be made liable to pay compensation. It was true that in the workman's action the plaintiffs' negligence was alleged. But, on the other hand, the plaintiffs were entitled to rely upon the soundness of the chain warranted by defendant; so the Court of Appeal held that the plaintiffs could recover from the defendant, as damages for breach of his warranty, the amount they had had to pay their injured workmen, and so a point of much practical interest and importance was established.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

T. H. H.—Wall.—Buildings.—Rights.—This is far too complicated a question to be answered in this column, and you should consult a local solicitor with plans and documents. But I consider the owner of building B has acquired various rights in the wall originally erected by A, both as a party-wall and as giving an easement of support, which will have to be arranged between them.

East Suffolk.—Lease.—Tenantable Repair.—Liability.—The tenant seems to be liable to do the work specified, except that of cleaning the chimneys, which is not usually included in a general covenant of this description.

E. L. W.—House.—Compulsory Sale.—You should claim its full value and 10 per cent. extra. Consult a good auctioneer and house agent as to form and amount of claim.

Provincial Architect.—Shop.—Extension.—Rights.—The adjoining owner may have acquired an easement in regard to his bell-handle and pilaster if he has had them in this position for 30 years. Otherwise the building owner seems entitled to go to the extent of his own frontage and on his own land. It appears to be a case for a fair compromise by cutting a notch, as suggested.

C. T.—Building.—"Structural Repairs."—I do not consider that the landlord's agreement "to keep the structure in good repair" would make him liable to repair the bath and hot-water fittings. But if you have not agreed to do internal repairs, you are not compelled to do them either.

Mr. R. S. Donkin, M.P., has offered to complete the infirmary at Tynemouth, at an estimated cost of £2,000, by the addition of an east wing and a porter's lodge.

On All Saints' Eve, at St. Saviour's Church for the Deaf and Dumb, Oxford-street, W., a memorial font was dedicated. It was designed by Sir Arthur Blomfield, A.R.A., architect of the church, and executed in alabaster and marble by Messrs. Earp and Hobbs.

LEGAL INTELLIGENCE.

Thickness of Walls.—Ex parte Goodwin.—In the Appeal Court, on Monday, before the Lord Chief Justice and Mr. Justice Grantham, Mr. M'Morran moved for a rule *nisi* to quash a conviction by Justices at Rochester. The applicant had been convicted on October 8 of disobedience to rules made by the Gillingham District Council in respect to the thickness of walls of houses which he had built. The ground of the motion was the alleged improper interference of a Justice not qualified. The Justice in question was Mr. Tozer, the chairman of the Gillingham District Council. At the hearing Mr. Tozer was present in Court, but on objection being taken to his presence by the solicitor for the defendant, he withdrew from the bench. He, however, took his seat in front of the bench, and not far from it. During the progress of the hearing he handed up pencil notes to the Justices, which were believed to be notes on the case. He also spoke about the charge to a Justice who, though on the bench, was not engaged in the case. Mr. Tozer also made remarks on the evidence of a witness. The Court granted a rule, so that Mr. Tozer might give his explanation in reply to these allegations.

Ambiguities of the Public Health (London) Act.—At Lambeth, on Monday, Mr. Hopkins delivered judgment in a case in which the Vestry of St. Mary, Newington, were summoned by Harry Richardson for neglecting to repair and amend a certain sewer draining several houses in Gurney-street, Newington. The complainant is the leaseholder of the houses in question, which are drained by a combined system, several houses being served by the same pipe connection with the sewer in the roadway. It was contended on behalf of the complainant that, this being a combined drain—to the construction of which the consent of the local authority had never been given—the vestry were, under recent decisions, liable for its repair. These proceedings were taken under Section 12 of the Public Health (London) Act, 1891. On behalf of vestry Mr. Morton Smith contended that the onus of showing that the drain was constructed illegally—that was to say, without the consent of the local authority—was upon the complainant. He also submitted that the vestry could not be proceeded against under this section of the Act, and remarked that since the decision in the case of "Kershaw v. Taylor" owners of this class of property had been trying to take advantage of the decision by throwing upon the vestry the onus of putting their property into a proper state. Mr. Hopkins observed that the first question which arose in the case was whether or not this was a sewer, or whether it was only a drain. He came to the conclusion that this was a sewer common to all the houses. He thought the onus of proof of its character was upon the vestry. The Public Health Act, 1891, provided no machinery by which the sanitary authority could be compelled to keep their sewers in order. The whole of the statute, from beginning to end, looked upon the vestry as the complainants. There was no process short of indictment by which the vestry—upon whom the burden of keeping this pipe in repair fell—could be compelled to repair its sewers. He did not think he could make any order under this statute to compel the vestry to repair this pipe, and the summons would therefore be dismissed. His Worship declined to allow the vestry costs as against the complainant, remarking that, upon the facts, he was against them.

Arbitration at Bangor.—The arbitration between the Bangor Corporation and Mrs. Schwabe, of Glyngarth, who claims £7,000 as the value of the Gazelle Tavern and certain land to be acquired by the former, on the Anglesey side of the Menai Straits, in connection with the purchase of the ferry, has been held this week. Mr. A. Saville, London, is the umpire; Mr. Fenwick, Leeds, is the arbitrator for Mrs. Schwabe, and Mr. Jones (Tapp and Jones), Westminster, for the corporation. The valuers called for Mrs. Schwabe are Messrs. W. B. C. Jones, Criccieth; R. G. Thomas, Menai bridge; W. E. Jones, county surveyor of Anglesey; D. Gillart, Machynlleth; and Wainwright, Liverpool. Evidence for the corporation of Bangor has been given by Captain N. P. Stewart, the chief agent of the Vaynol Estate; Mr. W. A. Dew, Mr. John Pritchard, Bangor, and other professional witnesses.

Lawyers Dispute a Building Agreement.—Macrory v. Gibbon.—The plaintiff in this case, heard by Mr. Justice Wright on Friday, was Mr. Edmund Macrory, Q.C., the owner of a leasehold house, No. 2, Ilchester-gardens, W. The defendant was Mr. Henry Gibbon, a solicitor, the owner of a block of residential flats just completed building in Moscow-road, which adjoins Ilchester-gardens. The plaintiff purchased the house in Ilchester-gardens in 1872, and lived there until some four years ago, since which time it has been to let. Down to within the last year or two there were only small cottages in Moscow-road, which in no way affected the light of his back premises. The lease of the cottages having fallen in, the defendant purchased the land and commenced building the flats in question. The plaintiff and his neighbour, Mr. W. B. Heath, when they found that a part of the new buildings came so close up at the back as seriously to interfere with their light and air, commenced a correspondence with the defendant. As a compromise, an agreement was entered into between the three, dated September 12, 1894, defining, as it was thought, within what lines the new buildings should be confined. In this agreement Mr. Gibbon undertook not to build in "such a way as to prevent Mr. Macrory, if he thought proper, opening windows overlooking his (the defendant's) well." Mr. Macrory considered that this gave him a right to open a new window in his kitchen, which, however, was found could not now be done. For the defendant it was contended that, having regard to the height of the buildings at the time, such a construction could not be placed on the agreement. Mr. Justice Wright gave judgment for Mr. Macrory, holding that the true construction of the agreement was that contended for by the plaintiff's counsel, and directed that that part of the building in dispute should be pulled down within three months, unless an appeal were entered.

CHIPS.

Mr. Cecil Smith, of the British Museum, left London on Monday to take up his post as Director of the British School at Athens.

The memorial stone of the new public hall in course of erection at Strathaven was laid on Saturday with Masonic honours. The structure is Seventeenth-century Scottish Renaissance in style, and the building, which is to cost £2,000, is to accommodate 650. There is a wide frontage, with committee-rooms, &c., and also a small hall to hold 250. Mr. John Park is the builder.

The Gateshead Stained Glass Company have erected a memorial window in the Unitarian Church, Templepatrick, County Antrim.

A new drinking-fountain has been erected in Pennell-square, Pontypridd, from designs by Mr. Charles B. Fowler, of Cardiff. It is erected in Portland stone, and is treated with British ornament adapted from the ancient crosses of Glamorganshire. Messrs. Letheren, of Cheltenham, provided the copper work, and Messrs. Martyn, also of Cheltenham, were the sculptors.

The Hungarian Government have offered to M. Michael von Munkacsy, the celebrated Hungarian painter, now in Paris, the post of Inspector of Fine Arts for the Kingdom of Hungary, with a salary equal to that of a Cabinet Minister.

The new clock which has been placed in the Cathedral tower by the Newcastle corporation was formally inaugurated on Tuesday. The work has been carried out by Messrs. William Potts and Sons, of Leeds and Newcastle. The clock is made on Lord Grimthorpe's principles, with his double three-legged gravity escapement. The clock is constructed on a solid horizontal, planed, cast-iron bed-frame, about 12ft. 6in. long, 3ft. wide, and 18in. deep. This rests upon cast-iron brackets built into the walls of the tower and bolted to them. The time is shown upon two new dials of skeleton cast-iron to form the figures, circles, and minutes, which are glazed with white opal glass for illumination, 6ft. 6in. each in diameter.

A public meeting was held on Wednesday evening in the vestry-hall of St. Anne's, Soho, to promote the restoration of St. Anne's church. A resolution was unanimously passed pledging the meeting to assist the committee in raising the £3,180 required. The movement cannot be deemed premature, for the London County Council has issued a notice condemning the church as a "dangerous structure."

Some ancient municipal documents have just been found in the loft at the Rochester Guildhall. They consist of official deeds, documents, records, and books of the time of Queen Elizabeth, together with the ancient "whipping-post" and other objects.

At the meeting of the corporation of the city of Glasgow, on Monday, it was unanimously resolved to invite the British Institute of Public Health to hold its congress in the year 1896 in the city of Glasgow.

A meeting of the executive committee of the Siddons Memorial Fund took place at the Paddington Vestry-hall, Harrow-road, on Monday. Two designs were selected from among those selected in competition, one representing Messrs. Siddons as "The Grecian Daughter" (her favourite character), by Mr. W. Day Keyworth, jun., and the other, representing "The Tragic Muse," by Mr. Cowell. It was agreed that the opinion of Sir Frederic Leighton, or of some other eminent artist, should be taken before the final selection was made. The statue, which will be exhibited at the Royal Academy before it is erected on Paddington-green, will probably be unveiled by Sir Henry Irving about the end of July next.

WATER SUPPLY AND SANITARY MATTERS.

Buckingham.—An inquiry was held at the Buckingham Town Hall, by Colonel Luard, R.E., one of the Inspectors of the Local Government Board, into an application of the Buckingham Town Council for sanction to borrow £9,050 for works of sewerage and sewage disposal. The engineer to the scheme, Mr. H. Bertram Nichols, C.E., of Birmingham, explained the details and gave evidence in support of the application. After the inquiry, the inspector visited the pumping site and sewage disposal site; his report will be made in due course.

Chorley, Lancashire. — The Corporation of Chorley have just completed their new sewage purification works at Common Bank Farm, at a cost of £15,000. Alderman Hibbert, C.C., the chairman of the sewage committee, performed the opening ceremony on Monday, October 28. The works have been designed by the borough engineer, Mr. William Leigh, A.M.Inst.C.E., and the whole has been carried out under his direction. The "International" is the process adopted. Mr. Leigh has provided tanks of a total capacity of 1,120,000 gallons and polarite filters of a total area of about 1,500 square yards. The sludge pressing machinery has been supplied by Messrs. Goddard, Massey, and Warner. These new works have been rendered necessary by the fact that the Chorley sewage farm has failed in producing an effluent to satisfy the requirements of the river authorities. At the conclusion of the opening ceremony in the Town Hall, Mr. Brierley, C.E. (Messrs. Brierley and Holt, Blackburn), speaking in response to the toast "The Visitors," said that, as an engineer of 40 years' experience, and one who held a public office for many years, he thought he should not be doing an important duty to a professional brother if he did not say that there was no part of the work which was not of a sound and practical kind, and that the whole had been admirably conceived and executed.

Exeter.—An inquiry was held on Thursday, Friday, and Saturday in last week by Major-General C. Phipps Carey, R.E., Local Government Board Inspector, respecting an application by the Exeter County Council to the Local Government Board for permission to borrow £42,000 for purposes of sewage disposal, and for an order determining to what point the tidal waters of the Exe should be included within the term "stream" for the purposes of the Rivers Pollution Prevention Acts. It was explained that the scheme proposed, which has been prepared by Mr. Cameron, the city surveyor, to make a large intercepting sewer into which all the existing sewers should flow, to take that large intercepting sewer into another sewer which would be built for the purpose of taking the whole of the sewage down to tidal waters, and there allow it to escape. The point of the outfall would be about 300 yards below Countess Weir bridge, almost opposite another outlet, the Alphing Brook, which conveys the sewage of St. Thomas. The population of Exeter at the present time was 37,500, and the amount of sewage might be put at 1,250,000 gallons per day, and the council contended that that amount of sewage, when poured into the river, would only give one-forty-eighth of the amount of river water which was there. It was also proposed to pass the sewage over two or three tumblers and two siphons, so that when it was emptied through the outfall at Countess Weir there would be practically no solid matter, and that the water would not be deteriorated at all. Evidence in support of the proposal was given by Mr. Cameron, C.E.; and against it, on behalf of the Exmouth District Council, by Mr. W. H. Beswick, surveyor to the latter body; Mr. Newton, C.E., of Manchester; Mr. Cousens, consulting engineer to the Exmouth Council; and on behalf of the riparian owners by Mr. Chatterton, C.E.

Water Supply to Dwellings in London.—The Local Government Board inquiry, conducted by Colonel Ducat, R.E., into the question whether, at the instance of the County Council, the eight Metropolitan water companies should be required to make certain alterations in their arrangements for the supply of water to dwelling-houses, was continued on Friday. Mr. Freeman, on behalf of the County Council, called evidence in support of the main point in the Council's requirements—an increase in the quantity of water provided for flushing for sanitary purposes from two to three gallons. Among the witnesses called on behalf of the Council were Dr. Murphy, Medical Officer of Health for the Administrative County of London, who considered three gallons essential; Mr. Wm. Groom, sanitary inspector to the Camberwell Vestry, who thought two gallons insufficient, and said the defective supply had caused great inconvenience in his district; Mr. Charles Tagg, clerk to the Camberwell Vestry, who concurred, and stated that his vestry had passed a resolution in favour of increased supply; Mr. Thomas Blashill, superintending architect to the Council; Mr. Keith Young; Mr. J. W. Clark, Liveryman of the Company of Plumbers, and Member of the Sanitary Institute; and Mr. R. Field, Member of the Council of Civil Engineers and that of the Sanitary Institute, all of whom gave evidence in support of the proposed increase of water supply for sanitary purposes in private dwellings. Counsel for the water companies cross-examined the witnesses in support of their contention that the increased supply demanded by the County Council is unnecessary. The inquiry was further adjourned to Monday, when Mr. Freeman concluded his case for the County Council, and Mr. Pember opened the case for the eight Water Companies. Dr. Louis Parkes, medical officer of health for Chelsea, gave evidence as to the water supply in working-class houses. In cross examination, this witness admitted that, with one or two exceptions, throughout the country, in districts where there were regulations as to the supply of water for sanitary purposes, the two-gallon flush was the one adopted. Professor Henry Robinson, C.E., lecturer on civil engineering at King's College, said that a two-gallon cistern in actual practice did not give a sufficent flush. [Our own experience confirms Professor Robinson's view, in spite of the opinions given subsequently on behalf of the contrary contention at the instance of the water companies, none of which seem to us of any weight.] On Wednesday and Thursday numerous witnesses were heard on behalf of the Water Companies.

CHIPS.

At Arundel, on Monday, the Duke of Norfolk laid the foundation stone of the drainage works being carried out in connection with the borough at a cost of between £6,000 and £7,000. The contractor is Mr. Hill, of Peterborough, and it will be completed by June next year. The Duke of Norfolk, after recently giving the borough a full water supply, has also consented to bear two-fifths of the cost of the drainage work up to £6,000.

The London County Council decided on Tuesday to proceed next session with a Bill to raise the present limit of the East London Water Company to the top story of the highest houses within the limits of supply.

A deputation from Edinburgh Town Council visited Glasgow on Friday, and inspected the dwellings erected by the Corporation Improvement Trust for the accommodation of the poorer classes.

An inquiry was held at the public offices, Egremont, on Friday, by Mr. Rienzi Walton, Local Government Board inspector, with regard to the application of the Wallasey Urban District Council for powers to borrow £22 000 for the extension of the gasworks. Mr. V. J. H. Crowther, the gas engineer, explained the proposals.

The parish church of Kidderminster, which has been restored at the sole cost of Mr. John Brinton, was reopened on October 31st. The work done include the complete refacing of the stonework of the north and south clerestories, of the whole of the west end of the nave, including new parapets, and of the whole of the tower from top to bottom, with the reinstatement of the groining under the tower, which was taken down many years ago, possibly owing to the weakness of a buttress. Mr. J. A. Chatwin, of Birmingham, was the architect, and Messrs. Collins and Godfrey, of Tewkesbury, were the builders.

The ancient vicarage attached to Frensham church, near Farnham, was gutted on Friday by a fire, which proved fatal to a nursemaid.

A Local Government Board inquiry was held at Tickhill, near Leeds, as to an application for sanction to borrow £2,500, to carry out a scheme of drainage prepared by Mr. Aird Murray, C.E., of Sheffield.

At the Court of the Cordwainers' Company, on the 6th inst., Mr. Howard Chatfeild Clarke was appointed surveyor to the company, and at the quarterly meeting of the trustees of Dr. Daniel Williams's charity, held at their library on the 31st ult., Mr. Howard Chatfeild Clarke was unanimously appointed surveyor to the trust.

The apsidal chancel of St. Agnes Church, Liverpool, one of the buildings by Mr. John L. Pearson, R.A., has just been decorated from designs by the architect, carried out by Mr. Nathaniel Hitch, sculptor, of London. The general idea represents "Worship," the Eucharistic service below leading up to that of the Angelic ranks above, who surround "The Lamb as It had been Slain," with all the splendour of the heavenly ritual as typified by the musical instruments held by the angels in the middle portion of the sculpture, and by the censers waved upwards by those introduced in the spandrels of the arches. Figures of the Archangels Michael and Gabriel keep a guard over the whole, placed, as they are, on carved brackets and under canopies at the commencement of the apse, while a semicircle of single figures similarly treated, and standing between the lancet windows, are representatives of the seraphim and the higher orders of the celestial hierarchy.

Our Office Table.

Mr. C. R. Ashbee, architect, the chairman of the Committee for the Survey of the Old Memorials of Greater London, writes protesting against the proposed destruction of the buildings of the Trinity Corporation Almshouses at Mile-End Gate. They are, he remarks, in date 1695, and occupy two sides of a grass quadrangle laid out formally and planted with trim clipped trees. At the northern end is the chapel, containing much interesting stained glass, brought from the old Hall of the Trinity House at Deptford when it was destroyed in 1786. In the centre of the quadrangle is a contemporary statue of Captain Sandes, a former benefactor, and the gracefully designed boundary wall which shuts off the court from the Mile-End-road has handsome gateposts and railings, the gabled ends of the houses bearing upon them charmingly-wrought models of old warships of the period. There is a tradition that the work is from the design of Sir Christopher Wren, who was employed in surveying an estate in Mile-End and Stepney. The Elder Brethren of the Trinity House, in justification of their proposed scheme, have pleaded that the drainage of the almshouses is insanitary; but as the new requirements of the local sanitary authorities are very slight, and do not involve an expenditure of more than £150 or so, the plea cannot be admitted as sufficient to justify the demolition of these picturesque buildings.

The City School of Architecture and Applied Arts at University College, Liverpool, is rapidly progressing under the supervision of Professor Frederick M. Simpson. The students at work in the studios now number about 130, and several of these are registered for the complete curriculum. The students have done good work, a model head by Miss Griffiths having gained a place in the Autumn Exhibition. Mr. Allen's statue, "Love and the Mermaid," has been bought for the permanent collection of the Walker Art Gallery, and his services have been engaged for the completion of the decoration of St. George's Hall. The amalgamation of the Literary and Historical Society with the Fine Arts Society has been successfully inaugurated, Professor Simpson being now associated with Professors Raleigh and Mackay in the trinity of presidents.

The Guild and Technical School at the Central Art Department, Bolt-court, Fleet-street, was publicly opened on Monday night. The school is under the joint control of the Technical Education Board of the London County Council and the National Society of Litho Artists, and is specially intended for lithographers and engravers. Every branch of study connected with the lithographic and engraving professions will be included in the various classes, and a special feature will be the establishment of classes for photo-process work. It is intended to form an advisory board consisting of scientists in the optical, chemical, and photographic world to give assistance to the more advanced students and those who are engaged in research work. Arrangements have been made for the instruction of students in the artistic as well as in the technical section, in the preparation of colour blocks for photo-process work, and in half-tone photo-lithography. The life class, with which is connected study from the cast, is under the direction of Mr. Cecil Rea. Mr. G. Frampton, A.R.A., and Mr. W. R. Lethaby, the inspectors under the board, have pointed out that what is required is not a mere art school, but that the teaching should be directly applied to matters connected with the production and design of lithographic work. Ordinary life drawing should be supplemented by much practice from the draped model, rapid studies being made in black and while, and in brush work. Antique drawing may be largely, if not altogether, eliminated, and real objects and natural growths used instead. There should be demonstrations and practice in original lithography, and an endeavour made to get as much out of the materials as possible. Lectures will be given in the course of the session by Mr. T. Way on "Original Lithography," Mr. Gleeson White on "Posters," Mr. William Morris on "Early Woodcut Illustration," Mr. Walter Crane, Mr. Cobden Sanderson on "Bookbinding," Mr. E. Walker on "Typography," and Mr. W. T. Wilkinson on "Collotype."

The fine-art collection to be displayed in the Victoria Art Galleries, Dundee, this year will be opened by his Excellency the Hon. Thomas F.

Bayard, ambassador from the United States of America. This year the exhibition is a joint one, the council of the Royal Scottish Water-Colour Society, whose annual exhibitions have been confined hitherto to Edinburgh and Glasgow, having been induced to include Dundee in their circuit. The collection of water colours, which are the exclusive work of their own members, is an exceptionally fine one. The Great Gallery and Galleries III. and IV. are hung with pictures contributed to the regular Dundee Fine Art Exhibition. The exhibition in these galleries includes Whistler's famous portrait of Thomas Carlyle and Albert Moore's "An Idyll," the last work painted by that artist.

A CURIOUS action arising out of the proposal to raise Winsford Bridge, which had sunk below its proper level owing to the salt subsidences in the neighbourhood, was heard on October 20th, in the Queen's Bench Division, before Mr. Justice Day and a jury. A Mr. Thomas Atherton, whose house abutted on the bridge, sought to restrain the Cheshire County Council from carrying out the work, as, if it were done, it would block up his front door, and so render his house useless. The defence was that the county council only proposed to restore the bridge to the old level; indeed, it would still be 2ft. lower than in 1856, and Sir E. Leader Williams, engineer of the Manchester Ship Canal, and from 1856 till 1872 engineer to the River Weaver Trustees, was called to prove this. The jury found for the defendants, and judgment was given for them accordingly.

AT the Delabole quarry a tunnel is about to be made from the bottom of the workings, which are about 300ft. in depth, to Trebarwith Strand, about a mile and a half from it, and there the addle, as it is called, will be thrown down over the cliffs into the sea. In this way a considerable expense will be saved, as the addle at the present time is brought to surface, and interferes with the proper working of the quarry. It is expected that in making the tunnel sufficient slate will be found to go a good way towards the heavy expense. The vein of slate is making in that direction towards the sea, but the new workings would enter on other landowners' property. The tunnel will cost £30,000, most of which will be spent in labour. Delabole slate is greatly in demand, and sooner or later the directors will have to face the difficulty, and provide better machinery and facilities for getting the slate quicker to market.

THERE is now in course of erection in South Esk-road, on the rapidly-developing Plashet Estate, East Ham, a row of houses, which are an extension of an attempt to apply the principles of co-operation to the owning and letting of working men's dwellings. In 1888, an association called the Tenant Co-operators, Limited, was formed with a view to helping working men to become houseowners without incurring the liabilities and difficulties attaching to other forms of building speculation. Capital, bearing 4 per cent. interest only, is raised, houses or blocks are bought or built and let to tenants at the normal rental of the district. Each tenant must become a shareholder (£1), and the profits, after depreciation, interest, and expenses have been met, are credited to each tenant's capital account in proportion to the rental paid. Such capital is not withdrawable but transferable, and by rule can be drawn upon by the society to pay for arrears of rent and internal repairs if necessary. The estate in South Esk-road, consisting of 16 tenement houses, makes the fourth now in the society's possession in various suburbs of London.

MR. F. VERNON, the secretary to the London Building Trades Federation, has just had an interview with Mr. Akers-Douglas, the First Commissioner of Works, respecting the position of "foremen" on Government contract works. Mr. Verdon asked for an alteration of the terms of contract imposed on all builders carrying out Government work, and the First Commissioner, after consulting with departmental authorities, has agreed to the amendment of Government contracts in the sense desired. The result will be that subcontractors can no longer be employed under the name of "foremen." In future foremen in Government contracts must be employed and paid directly by the contractors, having nothing to do with the carrying out of works. They will be paid servants of the contractors, and will in no way share profits with their employers.

AN examination of master and operative plumbers applying for registration was held on Saturday at the Borough-road Polytechnic, London. The candidates were present from various parts of London and the provinces. The practical tests applied included lead-bossing, pipe-bending, and joint-making. The examination questions included the subject of roof-covering, contamination of drinking water by faulty connections; arrangement of bath, sink, and closet wastes; drainage of town houses and its connection with sewers. The examiners were Mr. Charles Hudson, chairman of the board of examiners; Messrs. J. Hume and S. Stalder, master plumbers; Messrs. D. Early, W. J. Jarvis, and T. Nicholson, representatives of the United Operative Plumbers' Association; and Mr. C. T. Millis, superintendent of the trade classes. Fourteen per cent. of the masters and 18 per cent. of the operatives succeeded in passing the examination in practical workmanship.

A syndicate has purchased the site of Her Majesty's Theatre in the Haymarket. A new opera-house will be erected on a part of the site, from plans prepared by Mr. Walter Emden, M.S.A., and the remainder of the ground will be utilised for shops, club chambers, a restaurant, and an arcade. The building operations will be pushed forward as soon as the Crown and County Council authorities have been satisfied.

A new board school in Spotland-road, Rochdale, was opened on Monday. It has been erected from plans by Mr. T. Townend, jun., of Rochdale, acting in conjunction with Mr. C. E. T. Laurence, of Queen Victoria-street, E.C. It has a central hall 85ft. by 40ft., and 40ft. in height, lighted by clerestory windows, and on either side are classrooms. The contractors for building and joinery were Messrs. J. and J. Coats, of Rochdale, and for masonry Messrs. Nichol and Son, of the same town. The cost has been £14,000.

The Sunday Society celebrated this week Museum Sunday for the fourth time. Sixty-two sermons were delivered, nine by Church of England clergymen, in London. In the evening a meeting of the members of the Sunday Society was held, when it was reported that the services had all been well attended. It was estimated that between 40,000 and 50,000 persons had visited the institutions open during the afternoon. The National Sunday League and eight other Sunday-opening societies had joined in the celebration.

On Friday a stained-glass window, erected in St. Peter's Collegiate Church, Wolverhampton, as a memorial to the late Rev. Prebendary Jeffcock, formerly rector, was dedicated. The window is the central one of the south aisle, and the figures represent the four Evangelists. The work was designed by Mr. Kempe, London. The old oak screen in the chancel has been restored by Mr. Bridgeman, of Lichfield. In addition, a jewelled processional cross has been presented to the church by the family of the late Prebendary Jeffcock.

At Rugeley, on Wednesday week, memorial stones were laid of the new Heron-court Congregational Schools. The schools are to cost £1,000. The builders are Messrs. Thomas Lowe and Sons, of Burton-on-Trent, and the architect is Mr. William Gamble, also of Burton. The building will be of brick, with stone dressings, with a large lecture-hall 44ft. by 28ft. Surrounding the hall are no less than seven classrooms, with a spacious entrance hall. On the second floor there will also be a smaller lecture hall, 18ft. by 26ft., with other rooms and conveniences.

Mr. Henry J. Jeffery, M.S.A., of Ashford, Kent, who is erecting a large board school in that town for the Ashford School Board on the central hall principle, has been appointed architect to the Marden School Board, and has been requested to report on the national schools of that parish as to the possibility of altering and enlarging them to meet the requirements of the Education Department.

The Prince Regent of Bavaria has conferred upon Mr. Hubert Herkomer, R.A., the Order of Maximilian for Art and Science.

A new board school, built on the site of Queen Anne's House at Barton Hill, Bristol, was opened on Friday. It has been designed by Mr. Bligh Bond, of Bristol, to take in a mixed school of 520. The walls are of brick, with freestone dressings. The centre of the block from the ground floor to the roof is occupied by an assembly hall, 70ft. long, 25ft. wide, and 27ft. high. Four classrooms open from it on the ground level, and four more on a first floor reached by broad staircases, which communicate with a gallery running round three sides of the hall. There are also teachers'-room, cloakrooms, and lavatories. A piece of the ceiling of the Queen Anne's House and two of the fireplaces have been introduced into the building, which occupies the land where it once stood. Mr. J. Perrott was the builder.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Opening Address, by the President, Daniel Watney. 8 p.m.
Liverpool Architectural Society. "The Training of Workers in the Applied Arts," by R. Anning Bell, of University College. 6.30 p.m.
TUESDAY.—Sheffield Society of Architects and Surveyors. "The Brotherhood of Architects," by Paul Waterhouse, M.A., of London. 8 p.m.
WEDNESDAY.—Carpenters' Hall Lecture. "Sanitary Construction," by Professor Banister Fletcher, F.R.I.B.A. 8 p.m.
Institution of Civil Engineers. Presidential Address, by Sir Benjamin Baker, K.C.M.G. 8 p.m.
A. A. Camera Club. "Canterbury Cathedral," by C. H. Freeman. Illustrated by lantern views. 56, Great Marlborough-street, W. 8 p.m.
Northern Architectural Association. Opening Address, by the President, Jos. Oswald, F.R.I.B.A. Newcastle-on-Tyne Art Gallery. 7.30 p.m.

CHIPS.

The Master Plumbers' Association of Edinburgh and Leith held its annual general meeting on Wednesday week in 5, St. Andrew-square. Mr. Patrick Knox, the president, occupied the chair. The ordinary business was transacted, and office-bearers were appointed for the ensuing year.

The London and South-Western Railway Company have decided to further extend their Cornish system by the construction of a new line to Bude, which is now nine miles from the nearest railway station at Holsworthy.

Westminster Hospital was formally reopened on Friday by the president, the Duke of Westminster, after having been closed for some time and undergone various improvements at a cost of £5,000. The chief improvements, during the execution of which the place has been closed from the 1st of July to the 1st of October, consist in redraining and overhauling the interior. Important improvements have been made in the operating theatre, and the fittings required for carrying out the system of modern surgery have been supplied.

New schools are being erected at East Dereham, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The personal memorial to Dr. Jowett, Master of Balliol, will take the form of a tablet set in the wall of the college chapel, and containing a bust portrait by Mr. R. H. Hope Pinker.

Trinity Church, Limerick, has been reopened after restoration from plans under the superintendence of Mr. Robert Fogarty, of that city.

The district council of Castleton, Lancs, have instructed Mr. J. Diggle, C.E., to prepare plans and estimates for the completion of the sewerage scheme.

The county council of Cornwall have adopted plans by Mr. W. J. Jenkins for alterations and additions to the county lunatic asylum at Bodmin, estimated to cost about £5,000.

A new altar of English oak has been placed in Christ Church, Worthing. It is Early English in style, 7ft. long, 3ft. wide, and 3ft. in height. Mr. R. Singer Hyde, of Worthing, was the architect, and the work has been executed by Messrs. Harry Hems and Sons, of Exeter.

The annual exhibition of the Art Club of Glasgow was opened on Monday. It includes 276 works by over 90 artists, and is above the average in quality, the portraits being especially strong.

Centenary services were commenced at All Saints' Church, Southampton, on Friday. The church was consecrated on November 12th, 1795. It was built from the designs of Mr. John Reveley, a pupil of Sir William Chambers, the designer of Somerset House. The front was copied from the Temple of Minerva, and the ceiling was in imitation of the Arch of Titus at Rome. One of the tablets in the chancel, in memory of the Hon. Henrietta Dillon, is by Flaxman.

The new elementary schools for the Havant School Board are being warmed and ventilated throughout by mean of Shorland's patent Manchester grates, patent exhaust roof ventilators, and inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The ancient parish church of All Saints, Bubwith, near Selby, was reopened by the Archbishop of York on Thursday in last week, after having been restored from plans by Mr. G. Hodgson Fowler, F.S.A., of Durham. The outlay has been £2,000. The Archbishop unveiled a stained-glass window of one light in the south side of the chancel, representing the figure of St. John. It has been inserted by Sir Henry Vavasour, whose father and mother, and other ancestors, were interred in the chancel of the church.

A Roman Catholic school-chapel is about to be built at Woodhall Spa, from plans by Mr. R. Caine, of Woodhall and London.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2132.

FRIDAY, NOVEMBER 15, 1895.

SOME POINTS FROM MR. PENROSE.

THE last address of the President of the Institute will also be the last, he tells us, in the sense of being his final one in that capacity. All the more attention, therefore, is due to the remarks and suggestions it contains. The most important, perhaps, of the latter is one relating to the admission of distinguished architects as Fellows. During the last two years it seems only four Fellows have been elected who were not previously Associates, and within a twelvemonth the total number of Fellows has decreased by 23. We do not know that this, in the abstract, is altogether a matter for regret. Of course, there are profuse lamentations in certain quarters over the loss of subscriptions which this diminution implies. There is a small party who seem prepared to make Fellows of anybody and everybody who is willing to pay his four guineas a year. "It is sad, it is inexplicable," they say, "that more men do not come forward and do it." We think, on the contrary that it is neither sad nor strange. Architects, like other people, expect value for their money. If the affix of "F." to their names really implied, as it should do, more ability, or even more experience than the affix of "A.," they would be ready enough, when they had earned it, to subscribe more for it. But, as we all know, this has not hitherto been the case. In practice, the difference between Fellows and Associates has been imperceptible, and while it remains so, one can hardly expect reasonable beings to pay double fees for a distinction without a difference.

The title of Fellow ought to imply—and a movement is going on in the Institute to make it imply—that its possessor has really produced some satisfactory architectural work. The higher the standard of this work is kept, the more valued will the title be, and the fewer, down to a certain point, the names that bear it. If, for instance, they were limited by statute to 100, almost every architect would covet the honour of being included amongst them, and the Institute, if it selected them wisely, would rise enormously in public repute. Sooner or later this would "pay," even in the lowest and most sordid sense. The men who are ready to sacrifice the reputation of the Institute in order to increase its income may see at this moment that even its income cannot be increased in this degrading way. Telling all the world that you will admit them as Fellows is the last thing that will make all the world anxious to join. The fact is, that candidates do not care to apply, because entrance has become too easy. And yet there are exceptional cases in which we agree with Mr. Penrose that Fellowships might well be conferred by a vote of the council, without the necessity for an election by the members in general. Certain of the very ablest of our living architects are outside the Institute altogether. They have no private ends to gain by entering it, and it may very well be that they do not care to submit themselves to be voted for or against by a mixed body, with many of whom they have very little in common. Yet to aid in promoting the objects on which all true architects are agreed, they, or some of them, might be willing to join the Institute if, in their special case, the formality of an election could be waived. The experiment is worth trying, and the President has done well in suggesting it. The more select the class of Fellows becomes, the more likely it will be to receive, in this way, the ablest of outsiders, and the more distinguished, in consequence, will be the Institute as a whole.

"One of the greatest satisfactions an architect can feel," says Mr. Penrose, "is when the ultimate cost of a building is kept very closely to the first estimates." The great reason why this does not happen oftener is, that so many clients make their own estimates, and force them on their professional advisers. They have no special knowledge of building; but they do not hesitate for a moment to demand a very large amount of accommodation for a very small sum of money. They induce their architect, or some architect, to promise that they shall have it: for if the first architect does not say so, they try another and another, till they find one who does. Perhaps, by cutting everything down, he gets a contract signed for the stipulated amount. But to do this he has had to keep the details plain and cheap. It was the only honest way of solving the problem which his client set him; but the client likes it none the better for that. So he orders extras here and there and everywhere, and then, when the accounts come in, he turns round and abuses his architect because the work has not been done at contract price. He forgets that he made his own estimate, an ignorant and probably a greedy one. He is simply paying the penalty for his own foolish and grasping conduct.

On the subject of competitions, Mr. Penrose takes the side of "the architects who have arrived." They have emerged from the crowd—by the help, in most cases, of the competition system which they now condemn; and it is natural enough that they should be ready to abjure competitions henceforth and for ever. To them, more competitions will only mean, in all probability, more successful aspirants to honour, more rivals to divide with them the rewards of their early struggles. How much pleasanter for them and their co-equals to take share and share about in such good things as are going; how much nicer to substitute for a competition a choice between names, known and unknown! But what one does not see, on such a system, is how the owners of unknown names are ever likely to get an important commission. They must be content to live and die in obscurity unless they can work themselves into position by such arts as dunces glory in and men of parts despise. The competition system does offer to talent some sort of a career, though a very hard and rough one: the name-selecting system would take even this away. As Mr. Aston Webb pertinently remarked, a committee can no more be relied on to select the best name than the best design. The majority of committees would pitch upon some mediocrity, a respected "townsman," who looms larger in their eyes than the ablest man at a distance. The only thing that saves them from doing this—when they are saved—is to see the mediocrity visibly beaten as to his design; and before they can see this they must have a competition.

Mr. Penrose thinks that an architect's best work cannot be brought out by competition, and that even when the cleverest competitor is selected, he would have produced a much better building if he had been appointed in some other way. These things have often been said before; they have passed too long for unquestionable truths. Is it really the case that the competitive works of any noted architect are greatly inferior to his ordinary ones? Are the Houses of Parliament so far below Sir C. Barry's usual level? Is the Manchester Town Hall a discredit to Mr. Waterhouse, or the Imperial Institute to Mr. Collcutt, or are the Birmingham Law Courts so to their joint designers? Yet all these, and many more about which we might ask the same question, were competitive designs, and if we are assured that their authors would have done better still supposing that they had been appointed with no preliminary contest we reply first that this is a mere assumption, and secondly, that without a contest those authors would almost certainly never have been appointed at all. If, for instance, there had been no competition for the Houses of Parliament, they would not have been put into Barry's hands unconditionally, which is what Mr. Penrose's hypothesis suggests. No; they would have gone, almost certainly, to somebody with "influence"—somebody unknown to fame, whom we never have heard of, and never shall hear of; somebody with no architectural power, but with plenty of talent in making his way amongst the committee, and "their sisters, and their couisns, and their aunts." This is what it will come to in most cases if competitions are abolished, and till a substitute is discovered, they may be too bad for blessing, but they will remain too good for banning.

Mr. Penrose takes it for granted that we all believe in professional assessors. He assumes that "no response ought to be made to an invitation for any competition" unless one of these indispensable gentlemen is appointed. But the assessor question has not turned out to be so simple as it looked when a certain competitions memorial was sent round for signature ten or fifteen years ago. Then, confiding competitors thought that if they once got their assessor, all would be well. Now, the assessor often turns out a failure in more ways than one. Sometimes the committee keeps him dark, and only announces that "an architect of repute will be appointed to advise." This commonly means that he is the local surveyor, or some other official well under the thumb of the promoters, and that he will select the design sent in by their favourite. At other times the poor man does his best, but is hopelessly unfit for the position he has been hoisted into. Thus it was announced in a certain competition, a few years since, that "an eminent church-architect will act as adjudicator"; but when his name was announced, it appeared that he had never built a church in his life. More commonly the assessor's eminence is a titular one. He is not a great man, but a little man on a high pedestal. Committees, seeing him there, think he understands all mysteries, and can decide on any subject, from a board-school to a cathedral. He gives his decision, and exposes his ignorance. They know little of architecture, but they have sense enough to see, perhaps, that the design he has selected will not work. They pay its author the first premium, and pick out another set of plans for execution. This is hard on competitors, and they blame the committee. But the real blame should rest on the assessor, and on the crude, hastily-concocted system which made such an assessor possible. If this system is not to go on from failure to failure, assessors must be selected according to their special knowledge and qualifications —one for a church, another for a town hall, another for a theatre, another for a school, and so on. The mere "man of high standing" is played out, for a man may stand very high, and yet know very little about the classes of work with which he has not been specially concerned.

EMPLOYMENT OF ARCHITECTS.

THE impression that an architect's services may be dispensed with, or that it is possible to obtain all that is necessary without his intercession or help, is very common among people who believe that all advice can be had on the cheap. A large number of people think that a great deal may be had for the simple asking. We find such people asking an editor all kinds of silly questions, which could be more directly answered if they went to the proper sources for information, by writing to secretaries of societies or companies, by making inquiries at the works, or of specialists, by obtaining handbooks of the subject in question, and in other ways. We very often receive a question of this kind :—"I want to build a house, to cost not more than ——, to contain a certain number of rooms. Can you tell me what the sizes of the rooms should be, or tell me where I can get a plan?" Another will ask how he can make his basement dry or prevent the water coming in; a third, whether a certain invention he has made has been patented, and so on—questions that imply the inquirer will not take the trouble to go to the proper authorities, or wishes to save himself the cost of obtaining a professional opinion. If they can get the advice in this way, without trouble to themselves or expense, they believe they have all they want, not suspecting that cheap advice may be, after all, worthless, or what is worse, misleading. Still, there are hundreds of folk who prefer to go about their business in this way, even at the risk of losing hundreds of pounds. They are the same sort of people who continually go to quacks for advice at the risk of their lives, or who prefer to obtain through unreliable newspapers advice as to their ailments. It is the quack who thrives on these simple-minded folk. Like the qualified medical practitioner, the architect is shunned by people of this class. A friend who knows little or nothing of building, and has tinkered at it as an amateur, or the small builder, is appealed to in preference to the architect, and with a smattering of knowledge picked up in various ways, the self-reliant Philistine begins to build. Before the work is half finished he finds the mistake he has made of not consulting a professional man; the saved commission is dearly bought. Defects appear in the arrangement and the materials, to rectify which would cost a great deal more than the architect's commission. As it is with people of this sort so it is with many building committees. They imagine if they can obtain an idea of what they want gratis or on the cheap, or some practical information, they can dispense with an architect; so they advertise for designs, offering a small, often an insulting, premium, and at the same time insert the proviso that "they do not bind themselves to employ the author of the successful design, or to carry it out." What does this mean, but that they only advertise for suggestions, reserving to themselves the power to employ their own official to superintend the work? They get instead of one scheme, perhaps 50 or more designs to choose from for a paltry premium that would hardly suffice to pay the architect's commission of 2½ per cent. Take, for example, a competition for a building to cost £30,000. The fee of a professional man for a design, with the necessary plans for a work of this cost, would be £750 at 2½ per cent. Now what is the proportion of this sum usually paid to the successful competitor by way of premium? Often barely a seventh! A premium of £100 is offered in many cases for a greater amount of skill and labour than would be given by an architect who was privately commissioned to make a design, and for which he could charge the usual 2½ percentage. Mr. Penrose, in his presidential address at the Institute, referred to the West Ham Competition, which is a case in point, where he showed that 72 of the competitors out of 75 lost all the time and money spent. At the ordinary 1 per cent, the professional charge for sketches only, each competitor should have received £400, the cost being £40,000.

It seems astonishing to us that architects do not look at this question of competition in a true light. They are willing to sacrifice their time and labour for a remuneration they would scorn if offered in the usual way. Of course, we are now speaking of competitions in which the proviso is attached of not guaranteeing the architect's employment in carrying out the building. It is astonishing, we say, to find such a bait draws. It may be said, "Yes; but is there not the chance of winning the work as well as the premium?" There is a bare possibility of such a thing happening; but the odds are all the other way. The same architect would laugh at the idea of preparing a design for a building of this cost at a commission so far below the usual one, with the chance of being engaged. Why, then, does he throw away his labour in competing under such a condition? We know of one or two corporations who are at this moment contemplating the erection of municipal buildings. Southampton is one of them—and we do not blame the local authorities, if they can discover their requirements and the cost of such a building, by inviting architects to send in designs as a preliminary step. A competition of this kind would be fair and above board if the town council offered a generous reward for a set of sketch designs, and afterwards invited a smaller and selected number to enter for the final competition. But it is quite another matter to put a number of the profession to the cost and labour of sending in plans, telling them at the same time that they (the committee) do not bind themselves to select any design or employ its author. Speaking of competitions, the other day the President of the Manchester Society of Architects (Mr. Holden) spoke of this as one of the improper conditions imposed by committees, and said it was a matter of surprise that architects will compete when the conditions state "that the committee does not bind itself to employ any of the competing architects to carry out the work; that the whole of the drawings shall become the absolute property of the committee." It is as much as saying "We want ideas; we are willing to pay for the one we like the best, but we will not employ you to carry out the work." So long as the profession respond to these offers, they cannot expect the public to hold very highly the attainments of the architect. If promoters can obtain ideas and suggestions cheaply, they will prefer to go to the cheapest market for the superintendence.

Then is it not too true that there is a great deal of waste or red-tapeism about building operations that serve to frighten people from employing architects? A man wants a building to suit him or his business; he does not want drawings and documents, quantity surveyor, tenders, contractor, and goodness knows what beside—all necessary preliminaries, no doubt, but things which do not appeal to Mr. Smith or Mr. Brown. With it all there is too much separation between the actual building and the workman who does the work and the architect's function, as now exercised. The ordinary employer does not care a fig about architectural education, academic or technical classes, if he can get some one to carry out what he wants as inexpensively as possible. The profession may lay to heart these questions. As Mr. W. R. Lethaby well put it in his recent lecture on the "Designing of Modern Buildings," for the Technical Education Board of the L.C.C., design must be thought about as the natural outcome of the work, not as something added to it—a principle we have preached over and over again, but still not understood. It is a more direct way, after all, than making design a distinct business apart from workmanship, as something learned at schools of art and technical colleges, by a separate class of men who are supposed to be superior to those who use tools, and who are paid to make drawings. And the mischief comes from the notion that art is something that can be added to the real thing. Modern architecture of the professional specialism order encourages this idea by the attitude of many in the profession, in their delegation of certain branches of their work to others, in allowing the cost to exceed the amount originally intended, thereby giving people the impression that the architect's work is expensive and additional to the necessary requirements, and in adding unnecessarily to the elaboration and ornamentation of the building. Too much importance is attached by the profession to draughtsmanship as apart from the real design of the building. The result is that competition committees often make it a condition that the whole of the drawings are to become their property, as if the architect's services were mainly in the supply of the drawings, instead of in the whole conception and design of the building. This separation of the instruments from the actual building superintendence is one that has been fostered by the profession themselves in submitting to it. It is a virtual admission that their art is contained in the documents, and that these can be used by another party. Thus we often find that an inadequate premium is paid for the design shown in the drawings, and that the real work is given to someone else, who may be only a building surveyor. Need we say anything of the result of this commercial transaction, or the consequences to the building? Can we be astonished if the artistic merit of the design is lost in meagre details? The same thing occurs when an employer engages the architect to draw him a plan and elevation, which is then put into a builder's hands to carry out—buying, in fact, a design, to be mutilated or spoiled at the owner's will. All these anomalies are of modern growth, and indicate a wrong notion altogether of what an architect's work consists of. The legal disputes as to ownership of drawings, and the conditions as to employment sometimes entered into between the architect and his employers, confirm the views we have expressed—viz., that the public regard the architect too much as an unnecessary luxury that may be dispensed with for all ordinary building operations, and that for large and more important works his services can be partially purchased at a lower rate than the customary remuneration.

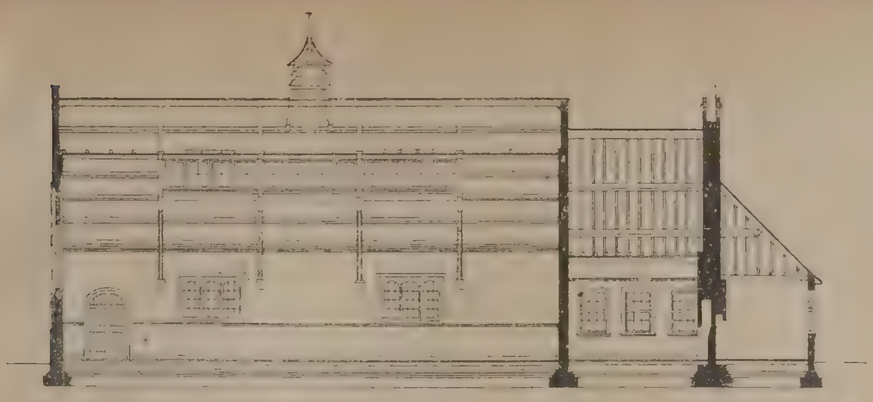
CONCERT HALLS AND ASSEMBLY ROOMS.—IV.

By Ernest A. E. Woodrow, A.R.I.B.A.

THOSE who attend the annual licensing sessions of the London County Council will be familiar with the term "for parochial purposes only." The number of licenses granted annually upon this condition increases yearly, though what the terms of the condition quite mean, and what are the restrictions they place upon the use of the license for music and dancing, is somewhat hard to define. Concerts, it is to be presumed, will be given on the premises so licensed, dances will be held, both entertainments being of a public character; otherwise no license would be required.

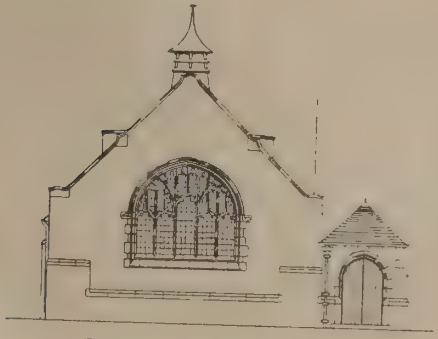
All will acknowledge that entertainments given to the public in connection with parish work, even if of a semi-public character, should only be given in premises suitable for the purpose. Therefore it is a matter of great satisfaction to find that an increased number of licenses are granted yearly to places in which entertainments of this class are given. This number is not only on the increase in London, but also in outlying counties. In Middlesex it is well known that the Middlesex County Council invite all owners of parish rooms to apply for a license, and to place themselves under the rules of the authorities. The restriction given with the license by the Middlesex Council is usually as to limiting the number of people to be admitted at one time; this avoids overcrowding, and does away with one of the greatest dangers from panic. The rules of the Middlesex County Council as to building so as to avoid fire are not so stringent as those of the London County Council, but no limit is placed by this latter licensing body upon the numbers to be admitted at one time.

It appears to many in London a great dis-



SECTION

advantage that the L C.C. does not follow the example of the Middlesex Council, and relax some of their structural conditions to places of this kind, and create the safety of the public, which it is their duty to do, by imposing the restriction as to the limit of the numbers admitted. By this means hundreds of places, now illegally being used for public music and dancing, and entertainments of the like kind, would come for a license, place themselves under the supervision of the authorities, and, in their minor details, be more fit for the reception of the public. To make myself more clear, let me take a case of a room which does not comply with the L C.C. rule as to half the boundary of the site being upon a public thoroughfare, but which does comply as to the number of exits required by the regulations for the number of people to be admitted. Under the present rules, the Council would refuse to approve the plans of such a room. If, however, they made a rule like the Middlesex County Council, to consult their architect if, in his opinion, the building would be safe for a limited number of people, there can be no doubt that many more places would be under their care than at present. Now, it is well known that the minor details which are observed in places of public resort which have received a license are of great importance; that they will be strictly observed in licensed premises; that the exits will be free, the doors will open outward, the fastenings will give way upon the doors being simply pushed; that if the gas goes out, there will be a second system of lighting; that there will be hydrants and fire-buckets to extinguish fires at their outbreak; and that many other details of importance will be observed for the protection of the public. In unlicensed buildings where entertainments are given these details are totally ignored, and where they are ignored there is great danger to the public, even though the building be upon a site complying with the regulations.

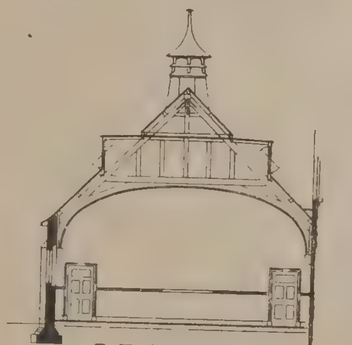


ELEVATION

If the doors open inwards or are locked, an isolated site would be of little avail if the building were overcrowded by admitting more than it was built to accommodate; and if the staircase became blocked, an isolated site would not help the struggling masses to escape. Do not let it be imagined that I am arguing against the advantages of the great question as to site. What I am endeavouring to point out is the very great desirability of placing all places of entertainment under the licensing authorities, so as to better the internal arrangements, and, where necessary, to limit the number admitted.

It must not be thought that, in discussing the policy of licensing questions, I am departing from the object of these papers in writing for the architect. This is a question that greatly interests the architect in many ways, as I shall endeavour in the course of these articles to show.

Now, to evade the licensing laws, many people think they are safe by refusing to take money at the doors. This is the greatest error that could possibly be made. A concert is no less public because the people buy tickets at a neighbouring shop instead of on the premises. The whole of the licensing question turns upon the word "public," the promiscuous admission of the public—that is, the admission of anyone of orderly character who may desire to be admitted, whether with or without payment, with or without ticket matters not. If the public are admitted, then the place must be licensed. I do not hesitate to say that there are hundreds of places in London which hold no license where the public are admitted, and many of these are quite unsafe for the purpose of the assemblage of people in large numbers, but would be comparatively secure with a limited audience, and the observance of the minor details enforced by the authorities in licensed buildings.



SECTION

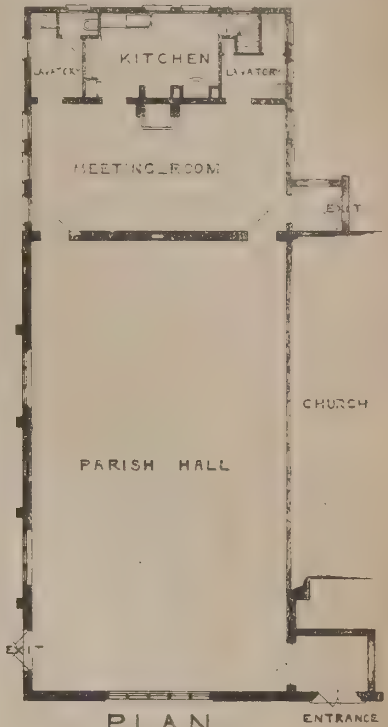
The whole of the foregoing remarks apply more to the use of the parish-room than to any other class of building used for public entertainment. In pointing out the necessity of obtaining a license for such places, I am warning the architect that the time may come when in London, as in Middlesex, his clients may be forced to take out a license, and even should he do so with the result that it be granted to him on the condition of "parochial purposes only," still he must remember that he is erecting a public building for the reception of the people. What are the many usages to which a parish-room will probably be put, I detailed in full in the second chapter of this series.

All these usages may, one would think, be styled "for parochial purposes"—that is, in connection in one way or another with some society or club in connection with the parish; but by holding a license, even with this condition attached, there is greater freedom of action, and no risk of a public or other informer.

When a complaint reaches the Council that an unlicensed building is being used for public entertainment, then frequently it is taken before the police magistrate, and in many cases fines have been imposed. The architect may avoid such a procedure being taken against his clients by making his building safe, and obtaining the certificate of the Council that it complies with the regulations.

In the diagrams given with this chapter are illustrated a small parish room attached to a suburban church, and designed by Mr. H. Saul. Here the rules of the authorities have been studied, so that should the clergyman desire, or be compelled, to apply for a license, he will not have to incur a heavy expenditure on structural alterations.

The room is intended for all classes of parochial assemblies. It has separate entrances and exits, a committee or tea-room in the rear, with kitchens, lavatories, &c., provided. It is a type of a small parish-room of which hundreds exist; but, unlike the majority, it has been planned with a view for its use by the public for entertainments and assemblages for other purposes. I have already remarked on the special danger in this class of building, which arises from the audience being so frequently composed of children. Not long since, a lecturer advocated the teaching of children in the Board Schools the art of leaving a room in an orderly "follow-my-leader" fashion. There was much practical common sense in this idea—one which the ratepayers would not cry out against so loudly as they do against so many of the extravagant notions of our School Board.



PLAN

The plan before us lends itself to such an orderly egress of children, one half leaving on the right, while the others leave by the exit on the left. Perhaps a worse crowd than that of children, which the architect has to remember will at one time or another occupy this class of room, is the crowd which collects at political meetings; here excitement is often carried so far that half the audience lose their heads, and a panic with such a highly-wrought assemblage would be most serious.

◆

ARCHITECTURAL ASSOCIATION.

THE second fortnightly meeting of the session was held on Friday evening, the President, Mr. W. D. Caröe, F.S.A., in the chair. The following 41 new members were elected: Messrs. H. Cresswell, F. W. Platt, A. Paull, A. S. Flower, M.A., L. G. Bird, G. C. Carter, P. M. Dawson, C. R. Dibdin, T. T. G. Donaldson-Selby, R. C. Hall, J. C. Hawes, C. Mossi, R. J. W. Newman, W. C. Oman, S. B. Pritlove, J. Bevir, H. W. Ford, J. E. Franck, H L. Goldsmith, C. E. W. Hope, L. C. Gregory, S. H. Hamp, C. H. Isaacs, W. G. Largen, A. C. Little, W. G. Milburn, R T. Miller, F. G. Newton, B. T. Rodd, E. Rowlandson, H. C. Scotto, W. J. Steel, F. C. Wheeler, L. K. Hall, F. N. Reckitt, C. L. Varndall, H A. Veale, W. S. Weatherly, H. White, W. H. Romaine-Walker, and J. Armitage, jun.

The President mentioned that the committee regretted the small response made this session to the classes in Modelling, a subject not within the scope of the Institute examinations, but one of the first of the handicrafts.

POMPEII.

An address on the architecture and decorations of Pompeii, illustrated by a large number of lime-light lantern views from photographs, was delivered by Mr. Talfourd Ely, M.A., F.S.A. The lecturer pointed out that Pompeii was an insignificant country town—one of a hundred little centres of life and trade once dotting the rich surface of sunny Campania. The oblivion that had obscured so many of her quondam rivals might well have extended to Pompeii herself had her fall been left to the ordinary agencies of time and the barbarian invader. But, paradoxically enough, Pompeii had been preserved by destruction, and the swift annihilation that swept her from the Roman world had enabled the 19th century to behold her face to face, presenting a strange and vivid picture of the life that was lived in Southern Italy well-nigh two thousand years ago. Pompeii had been called the Brighton of antiquity; Herne Bay or Clacton-on-Sea might have been nearer the mark. Yet the stately fanes of Athens, the mighty arches of Imperial Rome, could not mirror to us the everyday life of an ancient community as did this petty municipality with the sorry stock-in-trade of her little shops, and the *sgraffiti* on her walls, apparently fresh scribbled by a passing hand. That Pompeii once contained a considerable Hellenic population may be guessed from the remains of the Grecian temple, but it was not a Greek colony as its neighbour Neapolis was. In the Social War Pompeii took an active part, and was besieged by the great Sulla himself, and at a later date it became a favourite resort of the Roman nobility. In A.D. 63 the city suffered great damage from an earthquake, from which it had not recovered when, in A.D. 79, it was overwhelmed, together with Herculaneum, by an eruption of Vesuvius, an eruption described by the younger Pliny, though without special mention of the towns in question. The rare occurrence of the precious metals in the *débris* suggested that the ruins were searched shortly after the catastrophe. On the other hand, the diversion of the river's course and the extension of the shore between the sea and the walls long hindered the identification of the site in modern times. In 1748, however, the city was discovered; and in 1755 excavation began, in a somewhat haphazard fashion. The plan of the city, Mr. Ely continued, is roughly an oval, with a circumference of about two miles. The walls, strengthened with rampart and towers, still gird every side except that towards the sea. Mr. FitzGerald Marriott's work, "Facts about Pompeii," which will be found teeming with interesting results of personal investigation, shows that "the towers are not all built on the same plan." No attempt has been made to excavate either these towers or the walls, which date from long before the Roman occupation, though the towers date from the time that the walls were restrengthened and patched. As a rule, the streets are straight, and at right-angles to each other. A notable exception is the chief street, leading to the Forum from the north, which is very crooked, and only 14ft. wide, including the footpaths. Other streets are wider, but none exceed 30ft. The pavement is of lava. At Pompeii, the roads leading from the gates to the country were lined with tombs. The road leading to Herculaneum is noteworthy, the monuments being still in good condition, though the stucco-reliefs on some have perished. The public buildings already brought to light include the Forum, an amphitheatre, two theatres, arches, three sets of baths, a basilica, the edifice of Eumachia, and several temples, though not all that are mentioned in inscriptions. Nearly the whole of these had been overthrown, or at least damaged by the earthquake, and their restoration was not completed when the eruption of Vesuvius took place. The Forum was paved with a white limestone, brilliant as marble, surrounded on three sides by a Doric portico, and adorned with statues, the marble pedestals of which still remain. The names of most of the buildings in the neighbourhood of the Forum are very doubtful. The largest building is the Basilica, 220ft. in length by 80ft. in breadth, on the western side of the Forum, with which it is connected by five doorways. Its roof was supported by Ionic columns of brick coated with stucco. Though called a basilica, it lacks the usual apse. It possesses, however, a raised tribunal. An inscription proves that it was erected before B.C. 78. One only of the temples is purely Greek in style. Its scanty remnants show that it resembled the great Doric temple of Poseidon at Pæstum, built about 500 B.C. The paucity of remains suggests that this Greek temple was not restored after the earthquake. All other temples yet discovered at Pompeii stand raised on the Roman podium. The flutings of columns are generally filled up with stucco for one-third of their height, and this part is painted with red or yellow ochre. It appears that there was no good building-stone at hand, and marble was scarce. Tufa seems to have been used throughout the existence of the city. Limestone was used for private houses of early date, but not exclusively, the upper part of the building being of framework. The material of the peripteral Greek temple was tufa, with limestone capitals, the difference between these and the tufa shafts being concealed by a thin coating of stucco. In the basilica both limestone and tufa were employed, and later repairs were executed in brickwork. It is, however, in her private houses that the unique interest of Pompeii is centred. The earliest Italian houses were huts—originally circular, then oval, finally rectangular; with high-pitched roof, from which the water flowed outwards as in our buildings. Such houses are hardly to be found in Pompeii, where the atrium in which the rain is led inwards is the characteristic type. The compluvium admitted light and air, windows being scarce, for glass was not commonly used for such purposes in Pompeii, though frequently found in the later houses of Roman Britain. The oldest existing Pompeian houses, those of the 4th century B.C., were built of limestone, without mortar, the joints being filled with clay. The "Casa del Chirurgo" is an example. They were in their original state of only one story, and had no columns. In the next period the building material was tufa, which better admitted of ornament, as in the columns, which were now introduced under Greek influence. Limestone, however, was still employed for door-posts and for the main beams of the roof. The introduction of columns to support the roof encouraged the striving after additional space that seems to have characterised this tufa period, when houses were extended towards the back, colonnades being built round the garden to form the private part of the dwelling. In the early days of Pompeian excavation less attention was paid to the houses than to their contents. Fiorelli, however, saw that the buildings themselves should be preserved. He put in new woodwork, supported walls, and, in the "Casa del Balcone Pensile," succeeded in rescuing from destruction an actual instance of a projecting upper story. That upper stories existed throughout the city is proved, indeed, by the constant occurrence of stairs; and Dr. Middleton, in the "Dictionary of Antiquities," goes so far as to assert that "one-storied buildings were practically unknown in Pompeii." Buildings depicted on some of the walls have attics besides ground and first floors. Five-storied houses, placed against the southern cliff of the platform on which Pompeii stands, have lately been excavated. As the citizens lived much in the open air, the closed rooms are small, the kitchens especially. Of cellars there are few. Flooring, except upstairs, was seldom of wood, often some species of mosaic pavement, as the *opus Signinum*, which consisted of small pieces of tile (for which Signia was famous) and stucco well-rammed. Occasionally, the finest examples of mosaic decoration are found in these floors, as the celebrated representation of Alexander and Dareios, undoubtedly copied from a Greek painting of high rank, probably Helena's picture of the battle of Issos. Far more important are the walls of Pompeian houses, or rather the paintings with which they are decorated; for, apart from their value as reflecting the lost paintings of the Greeks, they enable us to trace with considerable accuracy their own history and that of the buildings in which they are found. Diverse as are these paintings in subject and execution, there are certain principles common to all. The walls are covered with stucco, and on this are painted the various pictures and ornaments. The painted wall-surface is horizontally divided into three parts. There are also perpendicular divisions, of which the central one is marked out as the principal field for pictorial display. A certain similarity of decoration is accounted for by the fact that the great majority of the paintings belong to the period subsequent to the earthquake of A.D. 63. As to the chronological sequence of these paintings, the reseaches of August Mau have enabled us to distinguish four epochs. At Pompeii, in the second century B.C. and the beginning of the first, this "Incrustation style" was imitated more economically in coloured stucco. This style, with its protruding blocks, was not adapted for paintings, so pictorial decoration was confined to mosaics on the floor. Such projecting blocks made rooms actually smaller. In the succeeding "architectural style" they were apparently increased in size, several planes being represented by the help of perspective, and the projecting parts being expressed by shading. The imitation of an easel-picture on the wall became now the dominant centre to which the painted blocks and the architectural forms of the earlier style simply served as a frame. Thus, from the time of Sulla to the Christian era, the older elements of decoration remained indeed, but were relegated to a subordinate position. For the succeeding half-century the "Candelabra style" prevailed, in which slender candelabra form a characteristic means of dividing the main fields of the design. In this Early Empire style all suggestion of squared stone blocks has disappeared. The plinth no longer appears to project beyond the middle surface, and the strongly-marked cornice above this middle portion of the wall is replaced by a small ornamental band. Whereas the centre of the wall in the second style was represented as a sort of pillared hall, in the background of which the picture was introduced, now, in this third style, the building is set aside, and the columns with the epistyle form only a frame. The plinth and the main field of the wall surface have their cornices replaced by a narrow band of bright colour, decked out with dainty ornaments. Above the main field is a frieze, generally black, on which are painted little objects of endless variety. The third or uppermost division of the wall contains slight ornamental architecture in dull colours. Much naturalistic foliage is employed. As to colour, many shades of red are employed. The plinth and the frieze are generally black—as are often the small panels. The colours of the upper portions are lighter. The chief characteristics, however, are the white or whitish pillars and candelabra. But the careful execution and sobriety of tone in this ornamental system did not satisfy the Post-Augustan Age, an age that demanded warmth of colour and startling effect. The wall was now apparently broken through, numberless fantastic and impossible buildings were depicted, through which one looks out into the open air. In these airy buildings are figures. Slender reeds do duty for columns, fanciful oddities crowd the wall—creatures that never existed, nor could exist. The old painted cornice is now replaced by a plastic one of stucco. Figures are larger than before; and a broad lattice or trellis ornament is a staple characteristic of the fourth and last style, which prevails above all others in Pompeii. Such are the four epochs of Pompeian wall-painting. As to the technical process of their execution, most may be content to follow Donner. For my own part I incline to the views of Mr. Cecil Harcourt Smith, whose article "Pictura" in the new edition of the "Dictionary of Antiquities," based on the researches of Blümner, gives a clear and reasonable account of the methods probably employed. The ancients used for their fresco-painting much thicker and more carefully-prepared layers of mortar than the moderns, and were, therefore, less trammelled by rapid drying. Some colours, however, required a medium such as milk or gum to fix them. On the difficult question of encaustic painting, much light has recently been thrown by the discovery in Egypt of several mummy portraits executed by this process. That in producing these portraits melted wax was laid on with a brush has been clearly shown by Prof. Flinders Petrie. A further and a far more interesting question remains to be considered—the subjects of the important pictures, and the source of their inspiration. Greek painting, from its perishable nature, has been little more to us than a tradition. With the sister art of sculpture time has dealt less harshly. The great painters of Hellas, on the other hand, are little more to us than the echo of a mighty name. As to Timanthes and Nikias, Aëtion and Theon, and Timomachos, much light has come to us, however, in these latter days from an unsuspected source. The critical acumen and patient labour of the great archæologist, Helbig, have established the intimate dependence of the best Campanian paintings on the works of artists famous in the Hellenistic age, and the close parallelism of both with the idyllic poetry of that prolific period. The copyists vary, of course, in fidelity to their originals. Naturally, there is but a limited number of cases in which such relationship can be definitely asserted. On this subject, however, I may, perhaps, be allowed to quote what I have written elsewhere.[*] "For the various pictures the student should take Helbig for his guide, who has enumerated nearly two thousand in his catalogue, a number now increased by some hundreds They do not reflect to us the art of periods earlier than Alexander, an art that introduced men only as occasion required, and did not favour *genre* representations. They rather reflect the art of Hellenistic times with its fondness for actual life, children sporting, &c. The art of Pompeii possesses little of the dramatic. It is rather idyllic, and smacks strongly of the Alexandrine poetry. In the whole number of pictures there are only two that can be called historical—the death of Sophonisba, with its portrait of Scipio, and a rough sketch of the fracas in the amphitheatre between the Pompeians and the men of Nuceria. Of the few that can reasonably be traced back to great originals, perhaps the most interesting is the Medea, that may well be descended from the masterpiece of Timomachos. The bulk of the representations are mythological; not dealing with the greater gods, except Apollo, Aphrodite, and Dionysos, but with Eros, Nike, Nereids, the attendants of Dionysos, and some of the heroes, as, notably, Herakles. The rare occurrence of Italian myths is accounted for by the lack of established types to copy. The failure of pictorial power, attested both by Pliny and Petronius, must, however, refer to conception rather than execution, which was still good, as we see by the wall-paintings, though these can give only an approximate idea of the contemporary easel-painting. These mythological pictures, with their tendency to the beautiful, together with some general types of mankind and scenes from comedy, which are rather characteristic than beautiful, form one of Helbig's two great divisions—the ideal, in which there are many replicas; and the realistic, in which there is only one example of each composition. These realistic pictures were less carefully executed than the ideal, and occupied inferior places. The best belong to the amphitheatre, and represent gladiators and wild beasts, Of ideal representations few are derived from epic poetry, which required a larger field, with many figures. Most are quiet or sentimental subjects, akin to those of idyllic poetry. In landscape we find oftenest a smiling Nature covered with the works of man, in which we may sometimes recognise the west coast of Italy, between Ostia and Salerno, and an illustration of Pliny's description of his villas. The important position of landscape in modern art, however, was never reached in antiquity. Ancient art was essentially plastic, and knew little or nothing of atmospheric effects. In delicate grace and lightness of pose, the decorative figures hovering on the Pompeian walls have never been surpassed. For purposes of decoration, the wall was divided into separate fields, the centre of each field being formed by a picture bounded by a painted frame. This was an imitation of the separate pictures on panel, and in some cases the picture was actually painted on a separate piece of stucco. Another clue to the great paintings of the 4th century has been found in mosaics. The mosaics of Pompeii are chiefly decorative; one, however, undoubtedly is copied from a Greek painting of a high rank—the mosaic of Alexander and Dareios. The moment chosen is one of intense interest. Alexander, charging the Persian bodyguard, transfixes with his lance the Persian noble who has thrown himself before his king. Dareios stands helplessly in the chariot, which the driver vainly seeks to disentangle from the *mêlée*. In the horse brought up for the king's escape we see the boldest foreshortening, and the face of the Persian reflected in a shield is another instance of technical skill. So excellent a copy implies a great original, and we can hardly be wrong in seeking that original in the famous picture of the battle of Issos, by Helena, daughter of Timon." Not to her pictorial treasures alone, however, does Pompeii owe her pre-eminence among the deserted cities of the ancient world. Her bronzes and other ornaments are of the greatest variety and beauty; but it is rather the abundant traces of human activity and traffic seemingly but this moment stopped that raise such vivid emotions in the traveller's breast. To the ordinary man with ordinary sympathy for his fellow man, the human interest of Pompeii will appeal with the greatest force.

At the close of the lecture a vote of thanks was accorded to the lecturer on the motion of Mr. A. Beresford Pite—who suggested that the Association might consider the possibility of an excursion to Pompeii next spring—seconded by Mr. G. H. Fellowes Prynne, and supported by Mr. FitzGerald Marriott.

THE SOCIETY OF ARCHITECTS.

THE annual report of the council for the year ending October 31st, 1895, is again of a satisfactory character. Sixty-four applicants have offered themselves as candidates, and of these forty, who, by the works they have carried out, proved themselves in every case to be competent architects, have been elected during the year to the membership of the society; and three gentlemen of distinction have been added to the list of honorary members—viz., the Rt. Rev. G. F. Browne, D.C.L., F.S.A., Lord Bishop of Stepney, the Very Rev. Frederic William Farrar, D.D., F.R.S., Dean of Canterbury, and Mr. John Ruskin, M.A. Against this two members have died, five have retired, and twelve members have been removed under Article 44; thus leaving a net total of 519 upon the roll of the society. The members' annual dinner was held at the St. James' Restaurant, on February 19th. At the ordinary meetings held during the session an address was delivered by the President, Mr. Edwin J. Hamilton, and papers (all of which were reported in these columns) were read by the Rev. J. Cave-Browne, M.A., and Messrs. Ellis Marsland, Herbert Batsford, F. Aumonier, R. Barry Parker, Henry Lovegrove, A.R.I.B.A., H. G. Quartermain, Geo. Payne, F.S.A., and J. Arthur Reeve. The ordinary meetings held on June 15th and July 13th took place in the field at the Roman Villa, Darenth, and Waltham Abbey respectively, and this new departure was a great success. At the various meetings of the council and the committees on finance, literary matters, and practice important questions affecting the society, and the individual as well as the general interests of members, have been repeatedly raised and settled, and the council hope that members will continue to avail themselves of the advice and experience offered them through the special standing committees. During the past year a register of students has been opened, and already fifteen students have been enrolled. During the year the meeting-room of the society has been furnished as a reading-room, and opened to the members for daily use from 10 a.m. to 6 p.m. It has proved of special value to country members for appointments, letter writing, &c., when in London. With reference to the examination for membership which comes into operation on November 1st, 1896, the council have already formulated and published a scheme of examination, together with the first list of qualifying examinations which will be accepted in lieu, or partly in lieu, of the society's own examination.

THE SURVEYORS' INSTITUTION.

THE twenty-eighth session of this institution was opened at the meeting of Monday evening last with an address by Mr. Daniel Watney, the president. There was a very full attendance, and the address was received with the cordiality and approval which its very practical character claimed from an audience of surveyors.

Mr. Watney began by disclaiming the right or the ability to lay down any new laws or to open up any new sources of knowledge. Knowledge, he said, was now open to all; and even omniscient presidents of the British Association had to content themselves with a sort of inventory of the scientific labours of the year—a mere counting of the new-grown leaves on the tree of knowledge. Where such authorities had to limit the scope of their pronouncements, it was hardly to he expected that he should go beyond the bounds within which practical knowledge was now confined. Beginning with agriculture, as befitted the president of an institution comprising so many members interested in the future prospects and in the present difficulties of the land question, Mr. Watney confessed himself unable to sound even one note of hope. Foreign competition and, what was more serious, foreign organisation were killing British corn-growing, and it was by opposing organisation to organisation that the British farmer could alone expect to establish any future prosperity. The British farmer did not lack in skill, in energy, or in natural advantages. It was, he believed, in the defective and obsolete methods of his marketing and transport arrangements that he lost the advantage, which his foreign rivals were so ready to seize. Despite all this, Mr. Watney did not take so gloomy a view of the future of British land as did some other speakers on the subject; but he warned those interested in it that improvement in its prospects must be the result of working from within rather than dependence on outside aid. He alluded to the spirited efforts now being made by the Hon. Horace Plunkett in Ireland, and Lord Winchilsea in England, to improve the small farmer's position. They worked, it is true, on different lines; but the idea of co-operation among the farmers seemed to lie at the bottom of both their schemes, which already showed some prospect of success. Mr. Plunkett's scheme especially gave promise for the Irish farmer, and there was no reason why it should not equally apply to the English difficulty. It consisted briefly of (1) improvement of methods; (2) simplification of relations between producer and consumer; (3) co-operation in the purchase of machinery, manures, and other necessaries; and (4) co-operative credit. So far as the plan had been worked, it had, as he had said, and as he further showed by figures, attained much success, and promised more. The question of foreign meat imports next engaged the speaker's attention; but, as he said, this was not so much a matter of competition in "market overt" as one of (too frequently) misrepresentation of origin. Land transfer and its simplification were next dealt with; but Mr. Watney seemed little hopeful that the lawyers would look favourably on any system which would take the details of these transactions out of their hands. He, indeed, quoted from speeches of past and present presidents of the Incorporated Law Society opinions greatly adverse to any alteration of the existing system. Mr. Watney next spoke, as an expert, on the subject of the neglected state of the science of forestry in our country. He foresaw the time when much of the land on which it had paid to grow corn must go out of cultivation, and he could not help thinking that much of the land might be devoted to timber-growing, not only with profit to the landowner, but with real and permanent benefit to the community at large. Those who, with perfectly good motives, had in past years disafforested large tracts of country for the purpose of laying them down to agriculture, would, he believed, be the first now to acknowledge that their policy had been a short-sighted one. Dealing with the subject of land, he mentioned that the transactions in landed property, as evidenced by the sales at the London Auction Mart, had, during the last 19 years, sunk from about 96,000 acres per annum, at a price of nearly five million pounds, to 11,500 acres per annum, at a price of not over a quarter of a million pounds, the average price per acre falling from £52 in 1875 to £24 10s. in 1894, or about 53 per cent. The question of local taxation was next dealt with. Since 1870 the rateable value of all property assessed had increased by 53 per cent.; but, while land in 1870 represented 40 millions, or one-third of the whole, it was now valued at only one-fifth. The increase was made up of nine millions added to the rateable value of railways, 47 millions on houses, and six millions on other rateable hereditaments. The whole 15 per cent. fall in the value of agricultural land was confined to the last fourteen years. The president spoke favourably, but guardedly, respecting the latest scheme for the oft-mentioned "Strand Improvement" of the London County Council. He regretted that some such a plan had not been adopted as that advocated by one of his predecessors, by which a low-level street running under the Strand would conduct the traffic into its obvious channel, the Victoria Embankment, instead of pouring it into the already overcrowded Strand and Wellington-street. He thought that the bold principle of "betterment" had been usefully modified in the case of the Tower Bridge (Southern Approaches) Bill, by the introduction of the apparently inseparable principle of "worse-ment," and by the provision that a dissatisfied owner might compel the authorities to buy his property at their own valuation. The president then dealt at some length, and with a minute criticism of details, with the question of "betterment" as it now appeared actually on the Statute Book, and concluded his address by a statement of the financial, numerical, and general progress of the Institution. It now, as he said, embraced, as its charter designed it to do, the whole of the United Kingdom. Nearly 200 members, composing the Irish Land Agents' Association, had become Fellows of the Institution. There was an entry of over 250 names for the next professional examinations, and the class of Colonial Fellows was steadily increasing. He made the important and interesting announcement that within the last few days the council of the Institution had brought to a conclusion the negotiations for a 999 years' lease of their premises and the four houses adjoining, and that early in the summer of 1896 they hoped to proceed with the demolition of the present very insufficient premises, and with the building of a new institution sufficient to answer all requirements for some years to come. This, he said, would, of course, involve a very large outlay; but he could congratulate the members on the fact that the Institution was the happy possessor of more than enough invested funds to meet the purpose.

---

[*] "Manual of Archæology," pp. 218-221.

A cordial vote of thanks to the President for his address was proposed by Mr. Squarey (past-president), and seconded by Mr. F. K. Munton (Associate), and passed by acclamation. The meeting then adjourned.

INSTITUTION OF CIVIL ENGINEERS.

THE first meeting of the session 1895-96 was held on Tuesday, when a portion of Mr. Charles Barry's new building, the theatre and approaches, with tea-room, &c., was made available for the purposes of the evening. Sir Benjamin Baker, K.C.M.G., LL.D., F.R.S., the new President, delivered his inaugural address. After some preliminary observations referring to the position of the Institution in the domain of engineering, and the necessity of British engineers acting together in a true spirit of comradeship throughout the world, the President proceeded to discuss the question why engineering, unlike other liberal arts, was an essentially modern profession. It had been frequently assumed that everyone acknowledged the benefits conferred upon humanity by engineers in facilitating communication, cheapening production, and raising the condition of the toiler; but the late Professor Froude had publicly stated that he failed to see much evidence of progress in the nature of men, and that "even in the outward essentials of food and clothing and housing it is not certain that the mass of mankind in the present generation are better off than their forefathers." The President was not prepared to accept this dictum, and maintained, on the contrary, that the mass of mankind were much better off than their forefathers in these respects. Further, that the independence of the labourer and mechanic had been greatly advanced in consequence of the vastly increased demand upon their services due to engineering work. In support of this view, it was stated that as recently as four years after the opening of the Liverpool and Manchester Railway, certain Dorsetshire labourers ventured to erect themselves into an elementary form of trade union, and were sentenced to seven years' penal servitude for their pains. At the present time many municipal contracts provided for payment of wages at trade-union rates, whereas a couple of centuries ago the magistrates fixed the rate at Quarter Sessions, according to the price of food and clothing, the average being about 1s. a day for carpenters and masons, and 8d. for labourers. The hours of labour for all classes were then from 5 a.m. till 8 p.m., with $2\frac{1}{2}$ hours' interval for meals and rest. The penalty for an employer who departed from these regulations was ten days' imprisonment and £5 fine, and for a workman twenty-one days' imprisonment. No man in search of work could beg without a license, the statutory penalty for a first offence being whipping at a cart's tail; while the second offence meant the loss of an ear and two days' scourging, and the third hanging. On the whole, the study of the past was conclusive as to the material and moral progress which had accompanied the development of engineering works. The President next dwelt upon the work done by physicists in the borderland of engineering, and expressed the opinion that, long before the coal-fields were exhausted, some way would have been discovered of tapping the inconceivably great reservoirs of force in Nature still untouched. In conclusion, the President sounded a note of warning against the growing disposition to overrate technical education.

NEW ENGLISH ART-CLUB.

THE pictures on the walls of the Dudley Gallery, Piccadilly, are in many senses "modern"; they represent a series of experiments in colour of the younger members of the English art or "Progressist" school, many of them crude and tentative, but a few representative of the higher aims of the Naturalistic school. The committee comprise such well-known names as Francis Bate, P. W. Steer, Edward Stott, Moffat P. Lindner, Walter Sickert, Alfred Lys Baldry, and Prof. Brown, and upon them the duty of selection has fallen. Entering the gallery, a number of white-framed water-colour studies attract the visitor, many of them subtle impressions of colour and atmosphere. Of these, H. H. Brabazon, W. Sickert, Moffat Lindner, James L Henry, and Miss Lucy Halkett may be mentioned as chief contributors. Miss Mary Hogarth's stalls and people in "A Breton Market" is an effective piece of colour; H. H. Brabazon's drawings of mountain scenery—"Vesuvius" and "Val d'Aosta"—are strong and vigorous sketches, full of subtle harmonies. These are landscape notes in which simple colour washes are used. Miss Malcolm has a full-length portrait of a young girl in white and satin shoes, rather too formal in pose. "Misty Evening, Boulogne" (18), by James L. Henry, is a pleasing atmospheric blending of tone, and A. M. Swan's "Sunshine" may be noticed also as an impression of sunlight in an ordinary atmosphere. Moffat Lindner's view, "Pasajés—Winter" (26), is a charming colour study, in which the blue sea is intensified by the bright red tile roofs of the houses skirting the bay. His expanse of blue sea, with reflection of light, "The Needles" (44), is subtle in harmony. One or two figure subjects by Edward Stott (29) and by Gilbert James (30)—the latter a pleasant piece of colour—and Fred Yates's "Old Man and Child" (38) are clever. A study of a girl in black, standing before a fire, by Walter Russell (40), is an effective arrangement in black and brown. A vigorous seascape by C. E. Holloway, "Lowestoft Harbour," exhibits some skill in the technique, the "loading" of the pigments, and the light on the rippled sea. B. Sickert has a sunny sketch, "Dover." Mark Fisher sends two characteristic effects: "Moonlight," a clever piece of sky painting (49), and "Summer Evening," a study of cattle and meadow, bright and fresh in colour and handling. Bertram Priestman has a broadly-painted landscape in greyish tone, and his "Inflowing Tide" (80) is of merit. A bold sketch is sent by Martin Bruce, "On the Ramparts, Bruges," and a portrait of "Robt. O. Sickert" by Geo. Thomson. Except as a study of colour and tone, P. Wilson Steer's large idealised figure subject, suggested by a verse from Wordsworth (79), of a seated girl before the glow of a fire, is not very satisfactory in conception or drawing. "Over the Whispering Wheat," by Francis Bate, a cornfield with blue distance, is broad and natural in treatment (83); and we must give praise to W. J. Yule's portrait, a study of a girl in scarlet cloak and hat, and the reflection of light on the face (85). Many other subjects on this wall are destitute of motive and crude in execution. L. Blatherwick's "Tulips," in glass, is a pleasing harmony of red and yellow. C. W. Furze's portrait of Hon. and Rev. A. T. Lyttelton, late Master of Selwin College, Cambridge, is a clever portrait of an intellectual face; and we notice a pleasing study of mist and sunlight by Stephen P. Mallet (64), and a well-drawn study of cows in field by Arthur Tomson. Few works of a decorative character are to be seen. Walter F. Cadby's "Dead Thistle" is one of the few symbolic subjects cleverly wrought out in a harmony of amber and green, and his frame of sketches, chiefly heads in chalk, are worth notice. We cannot find much charm of colour or composition in such efforts as that given us by Gilbert James in his "Three Chairs," a little girl seated by the side of her two dolls, except that it is a simple and direct mode of representing a fact, quite Japanese in motive, though hardly inventive enough in conception. It is rather a drollery. A similar composition is W. Sickert's curious work, "The Boy I Love is up in the Gallery" (73), in which the painter represents the gallery of a music-hall, with a group of boys looking down on the stage; but the drawing and colour are of the crudest, with apparently very little sentiment. If these and like studies are to be accepted as exponents of the methods of the modern school, we can hardly anticipate much from it; they are certainly without the quaintness or romance which is seen in the pre-Raphaelite pictures of some well-known painters, whose aim is to convey a definite sentiment. There is nothing either quaint, or romantic, or poetic in this sort of impressionism, which reminds one of Degas. C. Conder's Watteau-like composition, "L'Oiseau Bleu," is on white silk, and extremely delicate in its harmonies, and we have already mentioned the water-colour impressions, the portraits especially of Mr. Furze and Mr. Yule; but beyond these and a few others there is evidence of carelessness, or a desire to startle by introducing methods which the earlier impressionists avoided.

MARYLEBONE NEW PUBLIC BATHS AND WASHHOUSE.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS building comprises four swimming-baths, including Pompeian bath, 110 warm baths, public washhouse and laundry with 80 washing compartments, towel laundry, superintendent's apartments, and board-rooms. The present Pompeian swimming-bath will be lengthened to 100ft., so as to make it a good racing bath. The present entrance and pay-office will be disused in the future, and the space occupied by the pay-office will be converted into a club-room. The old entrance will be used for the public on the occasion of public entertainments. The new entrance will be at the west end of the bath, access being obtained to it from the Marylebone-road by means of a wide corridor. The ladies' swimming-bath is placed across the site immediately behind the front or administrative building. It is to be 60ft. in length by 24ft. wide, and has 35 dressing-boxes. A gallery runs round the bath on the top of the boxes, access to which is obtained from the bathroom by two circular iron staircases. The bath will be lined with white glazed tiles, relieved with painted tiles, after the design of the Pompeian bath. It will be surrounded by a marble curb, and the footways will be tiled. The room generally is to be finished as elaborately as the Pompeian bath, with tile panelled pilasters, surmounted by pairs of engaged columns with moulded caps supporting a moulded cornice and cove. The room is lighted by a large ornamented lantern light. The second and third-class baths are placed in front of the administrative building and in the basement, as were the old baths; but at right angles to the line of the old baths. They will be finished plainly, but well, with glazed-brick walls all round, tiled footways and slate curb round the baths. The baths will be lined all round with white glazed tiles, and the bottoms with white glazed bricks, relieved with blue patterns. Both are well lighted with large lantern lights. The second-class baths will have 54 boxes, and the third-class 48. All the baths will be ventilated by electric fans, and a soap and spray bath is provided for each department. The warm baths are all contained on the first floor of the building, which arrangement was one of the leading features of the design. There will be baths for 10 first-class women, 19 second class, 26 first-class men, and 55 second class. A number of specially fitted shower and spray baths are provided. Each bath compartment—both first and second class—is to be fitted in the most perfect manner, and they will be exceptionally large. The walls are 7ft. high, and of highly-finished enamelled slate. The baths will be of porcelain, enamelled inside, and with teak tops and enamelled slate risers. The walls of the rooms will be lined with glazed bricks, and the passage floors paved with bright tiles. All parts are lighted and ventilated by glazed lantern lights in the roofs. The arrangement of the washhouse and laundry is another special feature of the design. The washhouse is arranged with six rooms of washing compartments, the tubs in all of which are so placed that the women would all face one way—i.e., looking towards the drying-horses, which are all placed in one row in full view from the washhouse, and separated from same only by a glazed screen, so that each woman washing can keep an eye on her particular drying-horse. The ironing and mangling-room is on the other side of, and in full view also, from the laundry, so that altogether supervision should be an easy matter. Each woman would have two tubs with hot and cold water and steam supplies. Four large and powerful steam-driven wringing machines are placed in the centre under the control of a responsible officer; three other hand-power machines are also provided. The entrance for women will be, as before, from Seymour-street; but a large, well-lighted waiting-room and waiting-passage is provided. The washhouse is to be lighted by a very large lantern, and ventilated by a steam-driven fan. The boiler-house, engine-room, coal-stores, &c., are placed beneath the washhouse, laundry, &c. There will be three huge Galloway boilers to supply steam and hot-water all over the buildings, and it is intended that the engineering works generally shall be of the most perfect and substantial character. The various machines will be driven from a powerful engine. Space is provided in the engine-room for an electric-lighting plant if required in the future. The engineer's shop will be fitted up with a most complete repairing apparatus. The towel laundry, where so much of the work of the establishment is done, is particularly large, and well-lighted and ventilated. It will be fitted with twelve drying-horses and two washing-machines, besides wringers, washing-tubs, and steam-ironers, &c. The drying-horses for the public washhouse will be heated by large coke furnaces, fed and attended to from the basement. Storage room is provided for sixty tons of steam coal, ten tons of house coal, and nearly as much coke. Subways are formed under the footways of all the baths, so that the engineers can repair the main pipes, &c., without going into the various parts of the building. Commodious waiting halls and rooms are provided for each of the classes of warm baths. The front administrative building contains on the ground floor a double entrance for men in the centre, a separate entrance for ladies, and another for the commissioners' and superintendent's apartments. Between the entrances are two large and lofty waiting halls, respectively for first-class men and women. The main entrances lead into a large and lofty hall with a central pay-office, and staircases giving access to the second and third-class swimming baths and the second-class warm baths (men). On the first floor there are the board room, superintendent's office and lavatory, a ladies' waiting and toilet-room, and the second floor is devoted entirely to the superintendent's apartments. Externally the building will be faced with Portland stone up to the first floor level, and above that with red Fareham bricks, relieved with Portland stone dressings, cornices, strings, &c. The courtyard in front will be paved over—except where the skylights are over the swimming baths—and have broad pathways up to the entrances paved with mosaic. The front boundary fence will be faced with red bricks, relieved with moulded stone caps, copings, &c., and surmounted with an ornamental wrought iron railing, and copper lamps. The builder is Mr. Charles Wall, of Lots-road, Chelsea, and the architect Mr. Alfred Saxon Snell, F.R.I.B.A. The quantities of the building were taken out by Messrs. Northcroft, Son, and Neighbour, of 57, Charing Cross, S.W.

A CYCLING TOUR THROUGH NORMANDY.

[WITH ILLUSTRATIONS.]

A BICYCLE may be inartistic in itself, but it is incontestably the best means of viewing the art of a country. Travelling by rail entails the loss of roadside interest; walking involves the gain of roadside tedium. But on a cycle, travelling three times as fast as you would afoot, you enjoy the thoroughness of a walking tour while avoiding its delay. This may seem trite; but it is often the obvious which lies unnoticed. Normandy is an ideal country for such a tour. Food and lodging are cheap, the roads excellent, the people delightful.

Caen is too well known to need comment. Scarce a street in it but seems built for the pencil. It was there—near the Tours des Gensdarmes, I think—that we saw a scene forcibly suggestive of Mediæval building. The architect sits on a block of stone, with his drawing-board on his knees, and near him a couple of men are trimming stone with hatchets, at each stroke leaving a mark identical with those on the eastern transept walls of Canterbury Cathedral. We entered Chartres from Dreux. The Orléannais being on the central plain of France, lacks the variety of Norman scenery, but has a charm of its own. The white road strikes straight across the hills, which as you speed on seem to swell and rise behind you as the wave astern of a ship. Here and there amongst the trees springs a broach, such at Boullay Mivoye, or a saddle-back tower. Suddenly, as you climb a higher ridge, two pinnacles rise beyond a further hill, purple with the distance. They are the spires of Chartres.

The day of our arrival was a saint's day, and the day of the annual horse-fair, so that the city was gay. Of course, the traveller's first excursion is to the great church. But when there he feels but too keenly the hopelessness of seeing anything of it in a couple of days. We made the tour of the clerestory, our guide impressing on us that it was not usual, but done solely "pour obliger messieurs." One would fain linger by the windows, but time will not wait for us. In the belfry a vague want strikes the Englishman. The bells have no wheels. There is no rope for the ringer, but he stands above the bell and presses a lever with his foot. One man suffices for the smaller bells, four for the bourdon. The amount of carving on the northern spire is amazing, but the spire itself is more beautiful in detail than as a whole. The southern spire is grander, but appears too large for the tower below it. Looking from the parapet at the town below, the traveller realises most forcibly the French genius for roofs. Ridges, peaks, gables, dormers, extinguishers piled one above and behind another—they might have been thrown on. How different from the painful symmetry of a modern town! Nor when you descend into the town itself are you disappointed. St. Pierre is well-nigh fine enough for a cathedral; but it is a pity the spire was never completed. It was formerly a collegiate church; but the deliberate walk and pensive hum of the monk have given place to the quick step of the soldier, for the barracks now stand immediately south of the church. Leaving St. Pierre, and passing out through the Port Guillaume and then along the fossé, one reaches St. André. This was also a monastic church; the spring of the bridge which connected it with the other buildings is yet visible. At this day it is used as a store! Crossing the fossé, and climbing the hill by a narrow lane shut in by old-style windowless houses, you will come to St. Aignan. The Renaissance has left its mark; but the northern tower is attractive. The profuse internal decoration somewhat overpowers a sober Briton.

At Alençon we found ourselves in a very different country. Steeper and steeper rise the hills, their tops breaking with rock and heather, while tiles give way to slates. Domfront is not a town to be ridden through blindfold. The town is set on a hill. Round the steep slope, rising one above the other, run terraces formed by the ancient walls. Here stand quaint-roofed houses side by side with massive, machicolated towers. They are the jewels of the town's girdle, and fifteen yet remain out of the original twenty-four. Here are old-world gardens, mystic with odd nooks and buttresses and stairs. Above all towers a fragment of the old castle looking down on the mill-stemmed bareness below. Next we came to Mortain, a town of granite. The severity of the church tower is admirably in keeping with the material of which it is built; but the elaborate Norman mouldings carved on the south porch are surely a mistake. The view from the hill-top is magnificent, and defies description. Thence we caught a distant glimpse of the archangel's rock city which we were afterwards to visit.

Vire is a double Janus. It has four faces, each as unlike as could be. As for the town itself, the old clock tower alone is worth a long pilgrimage. It is surely a charm of French towns that every man carries on his own trade in his own house. Passing the open window of a turner's shop, I was struck by the peculiar chip, chip of his tools, and, turning back, I saw a bow lathe merrily working. "Wot a pore country!" the English mechanic would exclaim. But in England it is not every joiner who will press you to enter his garden, and bring out a chair that you may sketch his house—as occurred to us in Vire.

Chateau Grateau lies some six miles from Coutances. Our landlady told us there was nothing to see there. It was almost a ruin! A place habited by "cultivateurs," as another informant remarked, scornfully. However, we were pigheaded, and went. The chateau is a fine old house; but though the owner is wealthy, she suffers the family mansion to fall into decay. This is surely a pity, however sweet may be the autumnal fragrance attaching to a ruin. The "dame" who showed us over, told us that a fairy dwelt in the tower, and pointed to mystic signs carved by its hand on the overmantel of the uppermost chamber. Of course we believed; it would have been unromantic to remark their resemblance to heraldry.

Cerences we passed on our way from Coutances to Pontorson. The church is not remarkable, but the sinking of the octagon into the square in the tower seemed worth notice. Our tour ended in Brittany, and it was with regret and pleasure that we pondered how much can be seen and left behind in half a moon. E. B. Hawes.

BUILDERS' BENEVOLENT INSTITUTION.

THE annual dinner of the supporters of the Builders' Benevolent Institution took place on Thursday, Nov. 7, in the hall of the Carpenters' Company, London Wall. Mr. John Mowlem Burt, J.P., D.L. (president), occupied the chair, supported by the Master of the Carpenters' Company, Mr. J. C. Preston, clerk to the company, Major Isaacs, Messrs. T. F. Rider, J. Randall, L. J. Maton, C. B. Trollope, H. Northcroft, G. Burt, C. Bird, T. Hall, C. Bussell, J. W. Duffield, J. Pearson, T. Stirling, W. Higgs, J. T. Bolding, Henslow, and other friends of the charity, the company numbering about 160.

The President, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said it was not very often that they "brother chips" met round the festive board and enjoyed one another's company as they were doing that evening. They occasionally ran a little counter to one another's wishes, but they could only have one feeling in regard to this charity. It was usual on such occasions to submit a long string of facts and figures. He, however, would not trouble them with these, but would content himself with asking them to open their hearts and purses, and do all they could for an institution which was doing its level best to provide for those who had seen brighter days, and to aid in bridging over the period between their active life and the time when they would be no more. He believed he had circulated more than 3,000 appeals from the institution, and if these brought in only a pound apiece it would largely benefit the charity. He would, however, leave it to the good sense and generosity of his hearers to do the very best they could, and he would couple the toast with the name of Mr. George Plucknett, the hon. treasurer, who had done such good work for the institution, but whose health, he regretted, would not permit him to be present.

The toast was drunk with enthusiasm.

Mr. Maton gave "The Worshipful Company of Carpenters." The company had not only given the use of their magnificent hall, but were generous supporters of the charity. He believed, too, that none of the City Companies had done more to further the particular trades with which it was connected than the Carpenters' Company.

Mr. E. Smith (Master of the Carpenters' Company) replied. He said that the bond of union between carpenters and builders was a close one, and it was most fitting that these banquets should be held in that hall.

Mr. T. F. Rider, in an amusing speech, gave the toast of "The President." The head of an institution such as this should, he considered, possess three qualities. He should be a good-looking man, a good-tempered man, and a good-hearted man. He should, further, be well known and respected, and no man better fulfilled all these essentials than their President that evening. The toast was well received, and the President briefly replied.

The President next gave "The Architects and Surveyors," adding that not a few of the names in the contribution lists belonged to these bodies.

Major Isaacs replied for the architectural profession, and spoke of the friendly feeling that should always exist between its members and the builders. He added that in some cases the builder had come forward and shown practical difficulties, thus saving the architect from a fiasco.

Mr. C. B. Trollope replied for the surveyors. For many years he had had a large practice, and he had the deepest gratitude for the builders, from whom he had received every support.

The president proposed the toast of "The Visitors."

Mr. White, L.C.C., in replying, said that his sympathies were entirely with the builders, knowing as he did the hardships and difficulties they had to contend with. The ratepayers were paying much more than the value of the large works now being carried out by the London County Council, and he was doing all that he could to alter the conditions imposed upon builders.

Mr. C. Preston (Warden of the Carpenters' Company), gave "The Vice-Presidents, Committee, and Stewards," to which Mr. Alexander Ritchie and Mr. Lough responded.

In the course of the evening donations were announced amounting to £1,064, of which the large sum of £897 appeared in the president's list.

CONSTRUCTION OF TARRED FOOTWAYS.

IT is a very common mistake to include in one and the same category all descriptions of footways and roadways into the composition of which there enters tar, pitch, bitumen, or asphalte. As a matter of fact, all these ingredients do form the components of thoroughfares intended for both vehicular and pedestrian traffic. But they are seldom, or rarely—except in small quantities, as a kind of leaven—employed together. Experience unquestionably tends to demonstrate that, all circumstances taken into consideration, the asphaltic or bituminous pavement can hold its own with its old rivals, whether they be macadam, solid stone, or wooden setts. We are not at present concerned with roadways; but on the strength of the Euclidian axiom that the whole includes its part, it is quite safe for us to state that what is true of the roadway is true of the footway. Indeed, we might go a little further, and, borrowing another phrase of the old father of geometry, assert that our argument holds *a fortiori*. In a hygienic point of view, the testimony of the scientists, engineers, and members of the medical faculty throughout Europe and America is unanimous respecting the merits of this description of the surface-laying of thoroughfares. That it has some disadvantages no one will deny; but what other description of roadway or footway has not? There is not a single instance of construction, from the Forth Bridge down to the smallest example of building, engineering, or mechanical skill, in which the balance of merit is all on the one side. If we put the merits to be represented by the plus sign and the demerits by the minus sign, we shall always have the balance, whichever way it may incline, equal to the algebraical sum of the two quantities.

However well asphaltic footpaths answer their purpose in our Metropolis and other large cities, it is obvious that in suburban districts, provincial towns, and country places the great expense attending their laying down could not be justifiably undertaken by the local authorities. It may be said that the absolute weight of the pedestrian traffic on footpaths is literally nothing compared with that on roadways; but it must not be forgotten that, light as it undoubtedly is, there is a great deal of it, and in London pedestrian traffic continues in full force long after the heavy road traffic has ceased. While desirous of adopting for footpaths in the country towns some description of surface analogous to that which has proved so successful in large cities, the local authorities, as the cost of asphaltic footway was out of the question, were obliged to seek for a substitute. This substitute was found in gas tar, an artificial instead of a natural substance, such as asphalte is. When properly laid it has several of the advantages possessed by its city rival, and no doubt it would have been employed on a far larger scale had more attention been given to its preparation and the best manner of laying it down. These essential conditions have recently been very effectively carried out, and they are deserving of notice. The principal advantage claimed for tarred footpaths is cleanliness, not only in appearance, but in the facility with which they are cleansed or cleaned after the passage of traffic, simplicity in construction. They are, besides, easily repaired, and fairly exempt from climatic influences. As every superstructure must have an infrastructure or foundation, tarred footpaths, notwithstanding the comparatively extreme thinness of the upper or surface layer, are no exception to the general rule.

Before the permanent way can be laid on a railway the whole of the line must be levelled up to "formation level" or cut down, accordingly as the longitudinal section shows embankments or cuttings. So also for roadways and footpaths. They must all be brought to a hard, dry, and compact formation level of their own before the actual surface layer or—in the case of footways—"topping" can be added. Any good, hard, dry, clean materials will answer for the artificial substratum or "bottoming," as it is usually termed. It sometimes unfortunately happens that materials of this description are not to be had in the vicinity of the thoroughfares where they are required. Tarred footways, as already mentioned, must be made cheaply or not at all, and their estimate will not stand a heavy item for transport and cartage. It is not, therefore, an unusual occurrence for inferior materials to be used in the foundation or "bottoming," which is very detrimental, and even fatal, to the whole work. The very *raison d'être* of all compositions in which tar, pitch, or asphalte enters is that they should be impervious to water. When improper materials are employed in the construction of footways, they are no longer impervious to damp, and if wet weather should set in, the rain will soak through into the heart of the mixture, and the whole mass will become saturated with water, and gradually become converted into a soft, spongy, and sodden consistency. There is very little doubt that the use of bad and inferior materials in ordinary tarred footpaths very materially impeded their more general adoption, and, in ordinary parlance, gave them a bad name. One of the principal objections raised against tarred footpaths is that they cannot withstand the effects of a hot sun, and this objection has undoubtedly considerable weight in hot countries. But the reason is due, or rather was due, to the cause to which we have already alluded, to which may be added a defective and ill-arranged method of preparation. Considerable improvements have been made in the preparation and mixing of the different ingredients, and although it is very doubtful whether a tarred footpath will ever be endowed with the comparatively hard and unyielding surface of one of asphalte, yet there will be no fear of the wayfarer either sinking in it or sticking to it.

In preparing the mixture for the bottoming of tarred footpaths, the ingredients, such as slag, the refuse of iron furnaces, clinkers, broken stone, or clean hard gravel, washed, dried, and screened, should be mixed with the hot tar two or three months before it is to be placed *in situ*. This period is sufficient to enable the ingredients to become so thoroughly well incorporated with the tar, so as to obviate all chance of it subsequently becoming detached from them, or peeling off. The ingredients themselves must be heated to a certain temperature, as well as the tar, or they will absorb little or none of it. A very slight inspection will serve to ascertain this all-important point. If the materials have not absorbed at least a certain proportion of the tar, they can be washed quite clean again; but if the incorporation has been thoroughly well effected, it is impossible to remove all traces of the action of the tar. A little pitch is usually added to the tar, and the composition, which is boiled in a cauldron, or boiler, frequently contains a proportion of resin, cement, and other substances. The formation level of the pathway having been brought to the proper gradient and contour, and having been well rolled, is ready for the bottoming or concrete mixture, for such it really is. Two inches is sufficient for the thickness of the bottoming; but where crossings occur for the passage of vehicles it is advisable to add at least another inch. After the bottoming has been completed and well rolled, the top layer or surface topping may be put on. Some surveyors submit the bottoming to a week or two of traffic before overlaying it, but it is not always convenient to allow of this delay. The surface topping differs from the bottoming only in the smallest and finer quality of the ingredients, and in its thickness, which seldom exceeds 1in. or $1\frac{1}{4}$in. After being well rolled, with both light and heavy rollers—for, as a rule, it is almost impossible to roll a path of this description too much—the surface is flooded with the boiling solution, and then blinded while wet and sticky with clear white sand or granite dust. A tarred footway well made and well laid will last a very long while without requiring any repairs worth mentioning, if it be well attended to, and inequalities and abrasions made good as soon as they occur. The old adage, "A stitch in time saves nine," is peculiarly and forcibly applicable to these footpaths. After every two or three years, according to the nature of the traffic, it is a good plan to top dress the whole surface with the boiling solution and blind it again. Any spots which evince decided evidence of wear and tear should be cut clean out—not tinkered up—and fresh material well rammed in.

Dry weather—if it can be got—is the best time for executing all repairs, large and small, to tarred footways, but they will last from six to seven years without requiring the surface to be absolutely relaid. T. C.

TESTS OF CEMENT MORTAR.

UNDER this title Mr. A. G. Cooper, U.S. assistant engineer, gives a series of experiments undertaken to discover the value of various kinds of sands in cement mortar. These tests were carefully conducted to eliminate as far as possible all error, and the results are given in several tables in the *Journal* of the Franklin Institute for November, in which journal Mr. Cooper's article appears. He describes the method used in grading the sand. It was first graded by means of 13 sieves, ranging from 8 to 140 wires to the lineal inch. Thus the grade 8-12 means that the sand in this grade passed a sieve with eight wires to the inch, and was held by one with 12 wires. The mortar was mixed rather dry, though some cements and sands required more water than others to yield a mortar of the same consistency. Fine sand requires more water than coarse, and natural cements more than Portland. The briquettes were moulded in brass moulds, and the method of Professor Jameson used of putting the mortar into them at a uniform pressure of 200lb. The sands used are various, and are illustrated by a series of photos of the natural size of the grains of each sand. These sorts include river sand from the bed of the Savannah River, sharp and round grains mixed, beach sands, whiter and clearer and quite sharp; Tybee Bar sand, Cumberland quicksand, Augusta sand, red sandstone, pulverised sandstone, brown sandstone, Florida rock, trap rock, and granite sands, and these are illustrated by three grades of each. The results are given as follows:—Generally the coarser the sand the stronger the mortar made from it. There seemed to be a tendency towards increased strength with grades below 100—120, and an unmistakable indication of weakness in the upper grades 8—12. The Florida rock, which broke up into the sharpest sand of all, was not so good as some of the natural sands, probably owing to extremely smooth surfaces. Trap rock was not so sharp as Florida, but gave better results on account of the rougher surface. The granite was about the same as trap rock. As to beach and river sands, the latter is found the better for cement mortar by from 2 to 10 per cent. We have no space to examine the various tables of results, but we quote the conclusion given in Mr. Cooper's paper: "(1) Other things being equal, coarse sands are better than fine sands for cement mortar up to the grade 12—16, or about $\frac{1}{12}$in. diameter. (2) below the grade 40—50, or about $\frac{1}{50}$in. diameter, there is no practical difference in the value of the different sands, as far as the size is concerned. (3) The shape and condition of the surface of the grains of different sands has as much to do with their value for cement mortar as the size." The paper which we have summarised is worth attention by all users of cement mortars.

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—VIII.

By Joseph Horner.

DRAWS in a casting must not be confounded with blow-holes, or with general honeycombing. Draws like these are, of course, sources of weakness; but they differ from blow-holes and sponginess, in cause and in characteristics. They are not due to the presence of air or dirt, and they are not, as a rule, visible on the surface. The better—that is, the stronger—the metal is, the more liable is it to draw. And the draws occur in the heart of the thickest parts of the casting. They are due to unequal rates of cooling, and to crystallisation; the outside of the casting sets firmly while the interior is still molten, or, at least, viscous. As the interior shrinks, the set outside will not yield, and so the interior metal shrinks on itself, becoming drawn towards the outside metal. Then one of two things, or both, must happen: the crystallisation will be large, coarse, "open grained," and proportionately weak, or a cavity will be left about the centre. Given a tough, strong iron, and great disparity in thickness of metal, favourable to the more rapid cooling of some sections than others, and the metal is certain to become drawn. Hence, what some people think must be a good strong casting is a weak and uncertain one. Often, though the draw itself is not visible, its presence is indicated by a surface depression, with perhaps a very minute hole on the outside of the locality adjacent. As a blow-hole and a draw are due to entirely different causes, so their appearances are quite different and quite unmistakable. A blow-hole is bounded by smooth concave faces or edges. A hole caused by a draw always has sharp, jagged boundaries, generally of very irregular outline. As there are great differences in the dimensions of blow-holes, so there are in the dimensions of holes caused by drawing. Blow-holes merge into mere sponginess; draws diminish down to mere openness or extreme coarseness of crystallisation. Some holes due to drawing are so large that two or three fingers may easily be inserted in them; others will barely admit a pin between the coarse crystals. Draws, like many blow-holes, are generally concealed until the casting fractures; but their presence is often indicated by a slight depression of the surface adjacent, or by the presence of a small hole leading from the surface adjacent into them. Blow-holes generally occur on or near the upper surfaces of castings; draws may occur anywhere, in the bottom as well as in the top of the mould; in fact, they are often more likely to occur in the bottom. Thus, if a mould is of no very great depth, and it is fed during the period while the casting is setting with fresh supplies of molten metal over the parts where the metal is thickest, drawing will be prevented. But if there is thick metal in the bottom, the chances are that drawing will take place there. On the other hand, in a deep casting not fed, heavy metal in the bottom will not be likely to draw, because the superincumbent liquid mass will feed it; but the top metal will be likely to draw. The subject is too wide for adequate treatment here, even if it were quite germane to the subject. The fact which concerns us is that all draws are preventible by some method or another, either by alteration of design, or by the adoption of certain precautions on the part of the moulder. Engine cylinders are capital object-lessons in the drawing of castings. They are always made of tough, stiff metal, and invariably in localities where there is much excess of metal some sponginess may be confidently looked for. So, too, are large weights, such as are often cast for test loads and for foundry use. In such weights there is always a depression on the top face, due to the internal shrinkage, and if such weights are broken, there is always a central cavity also, or else very open crystallisation. Thus, supposing a girder made like Fig. 24, and the light and heavy flanges tied with ends or with cross ribs, the probability is that in the vicinity of the union of the ribs with the thick flange there would be a draw, as at *a*, and depressions at *b*, *c*, *c*. In the case of this girder, having a very heavy bottom flange, and pockets, A, for trimmer girders cast on one side, and brackets, B, on the other, there is every chance of a draw occurring in the thickest part. Or if an actual open space does not occur, the crystallisation will be very open, as shown at *a*. The obvious alternative is to lessen the mass of the bottom flange and to put smaller radii in the angles. In the case of the column head, Fig. 25, putting a straight core through side, A, masses too much metal at that locality, and there will be a draw at *a*, with probably a very slight circular depression of metal on the outside or inside, and the column will not be any stronger—probably weaker—than as if it were cored out to an equal thickness, as shown at B.

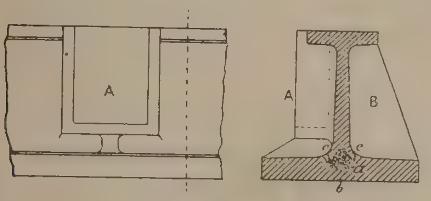


Fig. 24.

Fig. 26, side A, shows the effect of a heavy belt and thick bracket in continuation, in producing a draw. At side B, with the belt shown and bracket made no thicker than the thickness of the metal in the body of the column, no draw will occur.

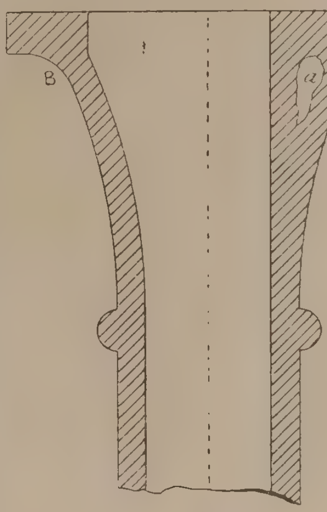

Fig. 25.

In these instances (Figs. 25 and 26) there would not be any appreciable risk of fracture, because the top flange is free to shrink inwards; but in some cases the risk of fracture becomes serious. It is serious when thick and thin adjacent parts are so tied that they are not left free to shrink. Heavy mouldings on columns ought, therefore, always to be cored out, to leave approximately the same section everywhere. Founders like to lump the metal in if they are paid by weight. In some cases it would pay to have an inspector frequently in the foundry to see cores put in the mould. It is much more easy to note thickness of metal in that way than in the casting.

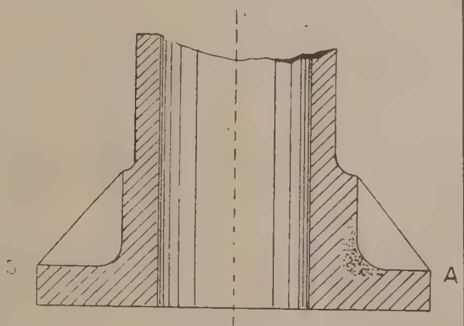

Fig. 26.

It follows that very large radii, if not lightened out by coring, are not so strong as smaller radii reinforced with brackets.

Obviously, too, the way to prevent draws, and to obtain the strongest, soundest castings from a given mass of metal, is to maintain adjacent thicknesses as nearly uniform as possible, so that there shall be uniformity in shrinkage; or if not uniform, then there must be no such pieces as brackets or ribs, which would act as ties or bars in the prevention of shrinkage. The shrinkage of metal will not cause draws or fracture as long as it is free to shrink; but when it is tied, then it will produce one or both results.

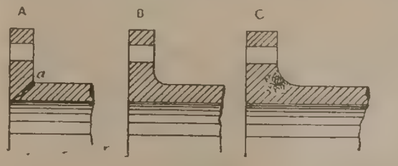

Fig. 27.

The tendency to draw is lessened, and the strength of castings increased, by abolishing all keen internal angles. This rule is of universal application. The evil of sharp angles is seen chiefly in flanges which have to take the pull of screw-bolts. In Fig. 27, the flange A would be certain to fracture in the direction shown at *a*, when under moderate stress only. The flange B would possess the maximum of strength. In the flange C the radius would be rather overdone, and the flange too thick. The two extremes—a very thick flange and a very large radius—would probably cause the draw shown, and produce fracture under less strain than that which would be required to fracture B. There is no advantage in a very large radius. A small radius, even less than that shown at B, adds immensely to the strength. The mere strength is not chiefly due to the increase of metal, but indirectly to the regular or symmetrical arrangement of crystals when cooling, which occurs when there are no abrupt re-entering angles. When such sharp angles do occur, there is an abrupt break in the arrangement of the crystals, and it is along that line of abrupt break that fracture will occur. Hence it is a rule that no iron castings to stand stresses should ever be made with keen internal angles. They should be fitted up and obliterated with radii, hollows, or fillets, as they are often called in the shops. In some positions the omission of these is not of much importance; but in other positions their omission will certainly insure fracture.

It is rather fortunate that the moulder's instinct prompts him to insert those radii in moulds when they are not put on the pattern; but as he will not incur too much responsibility, he generally "breaks the edge" with a hollow sleeker, which is much better than nothing at all. And many a flanged casting would be broken in the mould before ever it saw the light of day but for the precaution the moulder takes of digging away sand from between adjacent flanges or ribs, and from between flanges and box-bars, and so permits free shrinkage to take place. Without this precaution, the hard sand in the mould would prevent full shrinkage from taking place, and the tension put on the casting by shrinkage stresses would be greater than the tenacity of the red-hot or black-hot casting.

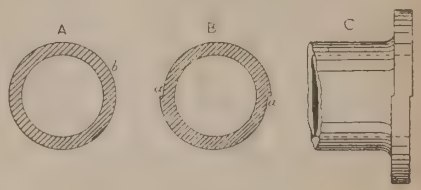

Fig. 28.

A column which has been chipped heavily along the flask joints should be carefully examined, because that is due to the shifting of the flasks on one another, or to the bad mending of a broken mould. It means that the metal will be thinned along the joints by the amount of overlap which has been chipped off. Lapping-joints like those shown in Fig. 28 are unsightly, besides detracting from the strength of the casting. The strength being measured by the diminished section at *a*, instead of at *b*, lapping to the extent shown in the figure ought to condemn a casting, even though a sound one. In Fig. 28 A is a section through a true column, and B a section through one which has overlapped. Some very slight amount of overlay is almost unavoidable in jobbing work, for which special flasks and patterns are not made. But it should never exceed, say, $\frac{1}{16}$in., or $\frac{1}{16}$in., full, at *a*. When it becomes $\frac{1}{8}$in. or $\frac{3}{16}$in., it is too much to be passed. If, in addition to the overlapping, the core happens to be out of centre sideways, then the thickness of metal will be still further diminished. Sometimes the flanges overlap, as shown at C. Then, if the flanges are faced, their thickness is reduced by the amount of overlap. If they bed on stone without facing them, they look unsightly. I should not pass a column with more than about $\frac{1}{16}$in. overlap of flanges.

* * *

In the case of Wallace Bruce Cox and Arthur Wesley Cox (trading as W. and A. Cox), Luton, builders, the order for discharge from bankruptcy has been suspended for two years, ending Jan. 1, 1898; and in that of Michael Henry Ryan Grant King's Norton, builder and contractor, the discharge has been suspended for four years, ending Oct. 17, 1899.

GRAPHICAL DETERMINATION OF THE STRESSES IN THE MEMBERS OF A COLLAR-BEAM ROOF-TRUSS.

As far as the writer is aware, there has not, up to the present, been published a method of dealing satisfactorily with the problem of determining the stresses in the members of a collar-beam roof-truss. The problem is not without interest from an educational point of view, even if it be regarded as in itself of little practical importance. In dealing with any such truss, we have to separate those external forces which produce *direct* stresses in the members from those which produce bending stress; and in the diagram of forces, all those forces which produce bending stress must be omitted, care being taken that the equilibrium of the remaining system of forces is still preserved. The principles which enable us so to separate the two sets of forces are the following. The first (*a*) is self-evident, and the second (*b*) may be readily deduced from the first.

(*a*) If a structure be maintained in equilibrium under the action of a system of forces, and two additional equal and opposite forces be applied at any point, the equilibrium of the structure will not be affected, nor the stresses in any of its members altered. (It is almost needless to say that two equal and opposite forces which act at any point may be *omitted* without affecting the equilibrium.)

(*b*) If a system of forces be in equilibrium, and any system of forces in equilibrium be added to or removed from the system, the resulting system will be in equilibrium, and the effects of the two sets of forces may be separately determined.

Let A, B, C, D, E represent a collar-beam roof-truss, loaded at the points A, B, C, D, E with the weights F_1, F_2, F_3, F_4, F_5 respectively; and first let us suppose the loading to be symmetrical, and therefore the resistances R_1 R_5 at A E to be vertical, and each equal to half the sum of the weights. Now the resultant, L A, of the forces R_1 F_1, which act at the point A, being resolved along the rafter, and at right-angles to it, will give us two forces M A, N A; where the force M A produces compression along the rafter, and the other force N A tends to *bend* the rafter, the bending moment evidently being force N A by length A B. The force N A evidently plays no part in producing *direct* stress in the rafter A, B, C.

We must now find what forces parallel to the force N A must act on the rafter at the points B C, so that under the action of these three forces the rafter may be in equilibrium, and subjected by them to cross-strain only. The rafter may be considered as a lever with the fulcrum at the point B, so we see that the forces at A and C will be *like* forces, and will be inversely proportional to the distances A B, B C.

The construction for the forces required at C B is shown at Fig. 1A. (Here A′ B′ = A B; B′ C′ = B C; N′ C′ = N A; and A′ P′ is parallel to B′ N′.) This gives P′ N′ for the force required at C, and C′ P′ for that required at B, in order for these forces and the force N A to keep the rafter in equilibrium.

Imagine now that at the point B two opposite forces, P, P_1, are applied at right angles to the rafter, and each equal to C′ P′; and two others, Q, Q_1, applied in the same manner at C, each of these being equal to P′ N′. By our principle (*a*) these will not affect the equilibrium, nor the stresses in any member of the truss; and by principle (*b*) the three forces N A, P_1, Q_1, and the force exerted by the rafter in opposition to their bending action, may be removed from the system of forces acting on and in the truss without affecting either the equilibrium of the whole system, or the *direct* stresses in any member of the truss.

The other rafter, E D C, must now be treated similarly, and we shall then have Fig. 2 for the frame diagram, showing only those external forces which go to produce direct stresses, and which must therefore appear in the stress diagram. Each bar in Fig. 2 is distinguished by a number, and in Fig. 2A the stress in any bar is represented by the line which has the corresponding number attached to it.

Fig. 2 *a* is the stress diagram, and is obtained by drawing *m a b c d e f g h m*, the polygon of the external forces with which we are now dealing, and then completing the polygon of forces for each of the joints of the truss, thus getting the stresses in the various members. The polygon of forces for A is *m a m*, giving compressive stress *m a* in A B. The polygon of forces for B is *h m a b k h*, and is obtained by drawing *b k* parallel to C B, and *k h* parallel to B D, thus giving compressive stress *b k* in B C, and tensile stress *k h* in B D. The polygon for C is *k b c d e k*, and is got by drawing *e k*, which must be parallel to D C, giving compressive stress *e k* in D C. The polygon for D is *g h k e f g*, giving compressive stress *f g* in E D. The polygon for E is *f g f*, giving compressive stress *g f* in D E. The student is advised to work thus fully until every step is clear to him. He can then safely omit what is not absolutely necessary.

J. C. Palmer.

BOOKS RECEIVED.

Plane Geometrical Drawings, by Robert Harris, Art Master at St. Paul's School, &c., new edition, enlarged (London: George Bell and Sons), is a new and revised edition of a useful note-book on practical geometry, written principally to meet the requirements of students preparing for the entrance examination of the Royal Military Academy, Woolwich, and the Military College at Sandhurst, and also candidates for the Engineering College, Science and Art Department, &c. Of course, there is nothing new, the problems are those which are found in all textbooks on practical geometry, and the solutions are clearly stated with the aid of good diagrams. A useful part of the book is that on construction of scales, in which plain scales, diagonal scales, comparative scales, Marquois scales, verniers, &c., are described, and their use explained. Another useful addition to books of this kind are the chapters on graphic arithmetic and graphic statics, which are of value to architectural and engineering students. The student of geometrical drawing and all architectural pupils will find something to learn.—— *Three Months in the Forests of France*, by Margaret Stokes, Hon. Mem. of the Royal Irish Academy, &c. (London: George Bell and Sons), is a series of letters commenced in 1892, relating to the early missions of the Irish Church in the 6th and 7th centuries, describing a pilgrimage in search of vestiges of the Irish Saints in France. The volume on our desk is handsomely bound and illustrated by several engravings and process-blocks. We have no space to enter into the subject of the various letters. The learned authoress of these letters has had in view the discovery of the "origins of Irish art and the reason for the development of certain styles in Ireland." She has given us her discoveries and researches in those parts of France most frequented by Irish travellers and settlers; localities about the middle of France and the bed of the Rhone. Miss Stokes appears to favour the view that the art of enamelling was largely practised in Ireland, as is proved by the fine examples in the museums of that country. She traces many points of resemblance between the incidents of Dante's Hell and those of earlier visions of the Irish seers. The legend of St. Fursa, whose mission from Ireland followed that of Columban, is dealt with, and his visions play an important part in those early conceptions of heaven and hell. St. Fursa (French, Furcy) is the patron saint of Lagny. Miss Stokes throws her heart and soul into the task of tracing the unity to be found in the arts and customs of Great Britain and Ireland. From the evidences shown in these works of a literary and artistic kind clearly a unity of aim prevailed in Ireland, Scotland, and England in the 7th century. In the forests of Luxeuil and Ardennes the authoress proceeds to gather up the threads of her story. The life of St. Columban in France, *circa* 574-595, is the first chapter; this is illustrated by traces of the great missionary found in Gaul, as they are also found in Italy. Many engravings enrich this chapter, also the letters from Luxeuil. Photo-engravings are given of the abbey and its architectural details, which are partly of Romanesque character; the manuscripts, font of St. Sauveur, &c. Part II. deals with the legend of St. Fursa (600-650), his death, his visions from "Acta Sanctorum Hiberniæ," edited by the Marquis of Bute. The letters from Lagny and Laon are of interest, and are illustrated by views of the church of St. Fursa, cathedral of Laon, &c. The appendices contain Gallo-Roman inscriptions found at Luxeuil; ancient MSS. belonging to the library; Early Irish MSS. in France; western chambers in primitive churches, &c. Those interested in legendary history, iconographists, archæologists, and others will find Miss Stokes's volume exceedingly interesting and instructive, as proving the constant intercourse that must have been kept up in these early times between Ireland and Gaul. Similar customs and arts in both countries, the anchorite life of the early bishops, the caves and subterranean chapels in the rocks support the intimate connection between the two countries.—— *Circular Sewer Discharges*, by a Municipal Engineer (London: The St. Bride's Press, Limited, Bride-lane, E.C.), is a very useful little book that can be carried in the waistcoat pocket, giving the discharges from circular sewers running full in cubic feet per minute. These tables are reprinted from the *Surveyor and Municipal and County Engineer*. The author uses Weisbach's formula, one of the most accurate. A distinct coefficient for friction for every change of velocity is given. From these tables the engineer will see at a glance the least fall which can be given for a certain sized sewer to maintain a self-cleansing flow. The municipal engineer, whose duties are onerous and constant, will find this little book most valuable in saving time and laborious calculation.

"THE TEMPTATION OF EVE," BY WM. BELL SCOTT.—SOANE MEDALLION DESIGN FOR A PICTURE AND SCULPTURE GALLERY.—BOARD SCHOOL, TODD'S NOOK, NEWCASTLE-ON-TYNE.—MARYLEBONE BATHS.—HOUSE AT CAMBERLEY.—SKETCHES IN CHARTRES AND NORMANDY ON A BICYCLE TOUR.

Our Illustrations.

"THE TEMPTATION OF EVE," BY WILLIAM BELL SCOTT.

This picture, specially photographed for our pages by Messrs. Dixon, of Albany-street, forms one of the small collection of typical works by members of the Pre-Raphaelite Brotherhood, housed in the picture galleries of the South Kensington Museum. William Bell Scott, the friend of Dante Gabriel Rossetti, like his companion, was frequently engaged in enterprises of a literary character, obtaining some little distinction as a poet, a biographer, and art essayist, besides being recognised for a good many years as an authority on industrial art and decorative painting. His ability in this latter direction was originally brought into prominence by the design which he submitted in the great public competition organised by the English Government, for the encouragement of design in historical painting, when the cartoons were exhibited in Westminster Hall. Bell Scott was not successful in obtaining either of the prizes on that occasion, but soon afterwards, in consequence of the credit which the ability of his composition secured, he was appointed to a position of some importance in connection with the Newcastle-on-Tyne School of Art. The late Sir Walter Trevelyan employed him in 1857-8 to execute a series of decorative paintings at Wallington Hall, a Northumbrian manor, which in the Survey of 1542 was described as "a strong toure and a stone house in good raparacions," and Leyland calls the mansion "the chefist house of the Fenwicks." The place, as it now stands, was rebuilt by the Blacketts early in the last century. Formerly the house inclosed a small courtyard, but this was roofed in, and forms the cortile round the walls of which "Scott of Newcastle," as he was called, painted his large panels representing the principal events of Northumbrian history. The subjects are arranged in the following order: 1. "The Death of Bede in his Cell at Jarrow." Several weeping monks are supporting the great ecclesiastic, while others anxiously peep with curious inquiry along the cloisters. The wind with a draughty gust has just blown out the candle, and pigeons, types of dissolution, are shown flying through the open window. One of the brethren has just inscribed the concluding verse of St. John, at the dying Bede's dictation. 2. "The Danes Invading Tynemouth" on a misty morning. In the foreground the men of the place are making haste to prepare their defence against the quaint, beak-headed vessels nearing the shore, while the female population seek refuge on the cliffs, with their children and household goods. The priory of Tynemouth is seen in the background in outline against a red sky. 3. Has a scene pitched on the desolate Farne Islands. King Egfrid, accompanied by Bishop Trumwine, is urging St. Cuthbert to accept the bishopric of Hexham. The hermit, leaning on his spade, forms a striking figure, his hermit dress contrasting strongly with the rich costumes of his petitioners. 4. Shows the building of the Roman Wall, with Craig Lough in the distance. 5. The border chieftain in the Castle of Newcastle realises the need of harry and foray by the empty state of his larder, the spur on the dish being brought in the place of dinner. 6. Bernard Gilpin prevents a border feud (1570) by taking down the challenge glove in Rothbury Church. Several of the figures are portraits of the Armstrongs, fine specimens of the Northumbrian race still conspicuous in the county. The monument in front of the picture is that of the Nevilles at Brancepeth; the stained-glass windows are from Ryton. 7. "The Wreck of the *Forfarshire*," lost on the Farne Islands, Sept. 7, 1838. The survivors, midst the pitiless storm, are watching the rescue boat as it approaches under the piloting of Grace Darling and her father. 8. "Newcastle in the 19th Century," showing the High Level Bridge and the different manufactures of the town, with powerful portraits introduced among the figures of men employed at Crawshay's and Stephenson's works. Enhanced interest is obtained in all these works by the representation of relics still existing in Northumbrian houses, and the characters are all portraits of well-known local men. Another series of mural paintings by Scott decorates the staircase walls of Penkill Castle, Girvan, the home of his friend, Miss Alice Boyd, in illustration of "The King's Quhair." This same lady presented to the nation the one sample of his skill to be found in the National Gallery (No. 1322). It is entitled, "The Eve of the Deluge," and the work is thus described: "On the terrace or upper story of an antediluvian palace, overlooking a plain, an Eastern prince sits, caressed by his wife, and surrounded by his retinue, on a raised platform bordered with flowering plants. At his feet tiger-cubs gambol. The empty goblet in his hand, and a rudely-fashioned harp held by a female slave on the left of the picture, suggests a recent banquet. Two of the male attendants, bending over the balcony, on which a jar of incense is burning, watch with expressions of amusement and curiosity the family of Noah, who are entering the Ark, which lies below the middle distance. From the horizon, a dark and ominous cloud is seen rising into the sky." The contour of the Ark and other points of detail are cleverly suggested, but the imaginative spirit of the picture is in no way impaired by an undue attention to accessories; indeed, some of them, in the matter of drawing, lack correctness and are wanting in truth to nature, as, for instance, in the cheetah, or leopard, and her cubs. There is not much to add about the "Temptation of Eve," which we illustrate to-day, from South Kensington. The conception is worthy of its author, who has treated a familiar subject with some degree of freshness, without any seeming effort after mere novelty or unduly constrained conventionality. The picture tells its tale simply, and, with unhesitating directness, embodies the artist's ideas of the baneful incident as recorded by Moses. William Bell Scott was born at Edinburgh in 1811; he died at Penkill on 22nd November, 1890. His father was well known as a Scottish engraver, and from him, as well as his elder brother, David, who also was a painter, young William derived an elementary instruction in his art, which he supplemented by studies at the "Trustees' Academy." At the age of twenty we hear of him drawing from "the antique" at the British Museum, though it was not till 1840 that he exhibited in any London public gallery. His first works shown were seen at the Suffolk-street Galleries—viz., "The Jester," "The Wild Huntsman," and "King Alfred Disguised as a Harper." Some years subsequently he exhibited at the Royal Academy and the British Institution, where his pictures figured at intervals up to 1869.

SOANE MEDALLION COMPETITION DESIGN FOR AN ART GALLERY: MEDAL OF MERIT AWARDED.

The subject set for this competition was a gallery for the exhibition of sculpture and painting. The site was a little larger than the gallery of the Royal Institute of Painters in Water Colours in Piccadilly, and open on all sides, the building to be two stories high. The problem was to amply light the ground floor without producing an appearance of weakness, the first floor being necessarily top-lighted, and the site too small to get a good court inside. In this design the galleries make a circuit of the site; they are 30ft. wide and 25ft. high. The windows on the ground floor are 5ft. wide and 14ft. high, the heads coming just below the ceiling level; the frames are in gunmetal. It was thought that the large entrance-hall below, and what is called the reception-room above, with the single flight of stairs 12ft. wide, would give an importance to the building, and the whole space might yet be used for the exhibition of objects of art. The reception-room is lighted by a range of windows whose sills are 14ft. from the floor level, and it is also top-lighted. The hall and staircase was to be finished in Cipolina marble, the columns having gunmetal caps and bases, a few panels of mosaic, and ornamental plaster ceilings and frieze. The reception-room was to be finished in walnut and tapestry, the remaining galleries being perfectly plain. Three offices are provided, the rooms for employés to be in basement. Externally the building to be in a warm freestone, the birds surmounting the angle piers to be of beaten copper, which, when weathered, would harmonise well with the stonework. The sculptured panels below the windows would represent the various arts, with portrait groups of the masters; the cutting of these might extend over a number of years. With the exception of the roof over the reception-room, which is of timber, all other roofs and floors to be of iron fireproof construction. The cost of the building was not asked for. A medal of merit was awarded to this design by the Royal Institute of British Architects to Mr. Harry Jefferis, of Haverstock Hill, who has since gone to Australia.

TODD'S NOOK SCHOOLS, NEWCASTLE-ON-TYNE.

These schools are built to designs prepared by Messrs. Dunn, Hansom, and Dunn, Newcastle, by Messrs. T. and R. Lamb, builders, Gateshead, and under the supervision of Mr. W. Walker, the clerk of works. The buildings, the cost of which is £11,000, will accommodate about 1,280 children, and are the largest Board school in Newcastle. On the ground floor is the infant school, in which there are five classrooms separated by glass screens; teachers' rooms, committee-rooms, lavatories, and covered-in playgrounds. Two spacious staircases with solid oak treads, the ends of which are built into the walls, lead to the first floor, on which there is a large schoolroom, measuring 84ft. by 34ft., and ten classrooms of dimensions varying from 25ft. by 20ft. to 34ft. by 30ft. The boys enter by the east wing, and the girls by the west, and there is a separate entrance for each sex from the playgrounds. The playgrounds are laid in cement, and the flooring throughout the building is composed of wood blocks. Glazed-brick dadoes run round the entire place. The material of the structure is stone from the Eaton quarries, and the windows are Miller's patent reversible frames. Messrs. H. Walker and Sons, of Newcastle, have attended to the heating and ventilation. The buildings were completed some little time since.

MARYLEBONE NEW PUBLIC BATHS AND WASHHOUSE.

(For description, see p. 696.)

HOUSE AT CAMBERLEY, SURREY.

This house has been built during the past twelve months upon a small building estate ten minutes' walk from Camberley station, and near the Royal Staff College, in a pine-wood district. The cost of the residence, including two acres of ground and all fees, was about two thousand pounds. Bracknell bricks were used, and the walls were built solid. The roof was covered with stained tiles from a Caversham firm at Reading. The interior walls were finished with "Duresco." A good supply of water was obtained at a depth of 18ft. The balcony over porch commands an extensive view towards Farnborough and Aldershot. Mr. G. Murrell, Blackwater, was the contractor. Mr. A. E. Sidford is the architect. The plans and elevations which accompany the view fully illustrate the arrangements.

A CYCLING TOUR THROUGH NORMANDY.

(See descriptive article on p. 697.)

◆

The town council of Cbard decided on Monday to adopt the Tooches scheme of drainage, and instructed Mr. Walrond, C.E., to prepare plans and specifications for carrying the same into effect.

Building Intelligence.

BIRMINGHAM.—The new church of St. Patrick in Dudley-road, Birmingham, was formally opened on Tuesday, the 29th ult. The extreme length of the building is 100ft., and the width 50ft. The clear width of the nave and chancel 23ft. 6in., and of the aisles and chapels 11ft. The west front consists of a deeply-recessed entrance with gable over the same, surmounted by a niche containing a statue of St. Patrick, between two large two-light windows with six-foil opening, the whole being surmounted by a steep gable terminating with a cross. On the south side is a small tower containing the Angelus bell, the gift of Admiral Tinklar. On the north is the baptistery, treated with an apsidal end, and in which is an alabaster font. The nave is divided into five bays, arcades of low arches separating the nave from the aisles. Four four-light clerestory windows are grouped over their respective bays. To the north of the chancel is the Lady-chapel, and on the other side that of St. Joseph. There are three confessionals and also sacristies. The roof is of trussed rafters and moulded pitch-pine ribs, and the aisle roofs are carried on internal flying buttresses in place of principals. In the centre is a turret containing a ventilator, and rising to a height of 88ft. above the street. The materials used are red bricks with red stone dressings, and tile roofs; and internally, red stone arches and columns with plaster walls. The style is French Gothic of the 12th century. The cost is about £5,000, and the architects are Messrs. Dempster and Heaton, of Birmingham, Mr. John Bowen, of Birmingham, having been the contractor. The wrought-iron gasfittings and communion-rails are by Messrs. Hardman, Powell, and Co. The heating, which is by radiators, is by Mr. Henry Hope, the other wrought-iron work being by Messrs. F. T. and A. Barratt and Co. and Messrs. Thomas Brown and Co.

BOSCOMBE, BOURNEMOUTH.—The new church of St. John the Evangelist, at Boscombe, was consecrated on Tuesday week. It will accommodate 1,000 worshippers, and consists of a nave, with north and south aisles, as well as an outer aisle on the south side, and chancel also flanked by aisles, that on the south being extended so as to provide an organ chamber. Beyond these are the vestries for the clergy and choir, with a porch and convenient lavatory. A tower and spire will eventually be added. The building has flint-faced wallings on the exterior, with stone dressings, the chequered work giving it a distinctive character. The interior is wholly of Bath stone, with blue stone bands. The columns of the arcades are of alternate Dumfries and blue lias stone. The roof is open-timbered of pitch-pine, covered with Broseley tiles. The style selected is the Middle Decorated. The fittings of the church are all of oak, and were made in Bournemouth by Messrs. Jenkins and Son, of Wolverton Works, the general contractors. The base of the pulpit and its approaches are of Painswick stone, and the body, which is twelve-sided on plan, is of wainscot oak; it has been made from the architects' designs by Messrs. Harry Hems and Sons, of Longbrook-street, Exeter. Messrs. Hems and Sons have also carried out the stalls and their platforms, which are in Riga oak. The panelling below the east window is by Mr. W. Brindley, of London, who has also provided the pavement and steps in the chancel, and the whole of the stone carving. The architects are Messrs. J. Oldrid Scott, F.S.A., of London, and C. T. Miles, of Bournemouth. The tile flooring is by Messrs. Godwin and Hewitt, of Hereford, and the wood flooring by the Wood Block Flooring Company. The contract price was £13,846.

BRISTOL.—Considerable additions and alterations are being made to a house in Clifton, Bristol, the property of Mr. Lionel A. Olive, of Ventnor. The premises are in a row of old-fashioned houses, and the additions consist mainly in carrying up a low wing containing a ballroom, with two floors of bedrooms over, surmounted by a flat roof railed in to form a promenade. The roof was first constructed on the raised portions of the existing side walls. The first and second floors were next inserted, the main front and back walls following. In the ball-room there are two fireplaces, one in connection with a large bay window forming an ingle nook, over which (and approached by the main staircase) is a minstrels' gallery. A billiard-room is placed on the first-floor level carried by steel girders. The table has been supplied by Messrs. Burroughs and Watts. The new apartments, like those in the existing house, will be lighted by the electric light, and the sanitary, hot water, and heating and ventilating arrangements have received care. Mr. William Veals is the builder, and the architect is Mr. E. Henry Edwards, of Bristol.

CHEDDLETON.—The foundation-stone of the asylum which is being erected between Leek and Cheddleton by the Staffordshire County Council, for the accommodation of lunatics in North Staffordshire, was laid a few days since by Lord Wrottesley. The asylum site altogether covers 175 acres, and comprises two farms near the Wall Grange Junction on the North Staffordshire Railway, and 2½ miles from Leek. It will be arranged in blocks on an oblique plan, and facing south-west, each being isolated and devoted to different stages of lunacy. The buildings in course of construction will cover eight acres, and are intended to accommodate 600 inmates—300 males and 300 females—and provision is made for further extensions for 200 more, making 800 in all. They will be built of faced bricks with stone dressings, the material being obtained from local sources. All the floors will be fireproof. The architects are Messrs. John Giles, Gough, and Trollope, London, whose plans were selected in competition in 1893, Mr. C. H. Howell being the assessor, and the contractors Messrs. W. Brown and Son, Salford, whose contract for the buildings alone is £175,000. The asylum is to be completed by the spring of 1898. The surplus land will be used for farming purposes. The design includes, in addition to the main buildings and offices, a chapel for 450 patients, superintendent's house, recreation and dining-hall, with stage arrangements, two lodges, laundry, ample farm buildings, workshops, infectious diseases hospital, mortuary, and airing courts. No boundary-walls are required round the whole estate. Provision is also made for warming, ventilating, cooking, and washing appliances and machinery, the water-service, storage of rain-water, formation of roads, &c. The infectious diseases hospital will provide for twelve beds, and will be placed 300yds. distant from the main buildings, on the highest point of the site. The mortuary will also be completely detached from the main buildings. A permanent well of 7ft. diameter has been sunk to a depth of 110ft., and the yield is 70,000 gallons a day. From the well the water will be pumped to a tower 100ft. high, with reservoir holding 35,000 gallons. The illuminant will probably be the electric light.

EXMINSTER.—The 15th-century parish church of St. Martin was reopened after restoration on Monday. The old timbers of the roof have been repaired and strengthened, covered with new slating on the outside, and a plastered barrel ceiling placed between the moulded ribs on the inside. In the interior an improvement has been effected by the removal of the western galleries, and the opening to view of the tower arch and western window. The font, constructed in 1843, has been mounted on a new base, and placed in the tower. The old pews have been replaced by oak seats, and the floors under them laid with wood blocks; the passages have been paved. The works have been carried out by Mr. Herbert Read, of St. Sidwell's Art Works, Exeter, under the direction of the architects, Messrs. Rowell and Son, at a cost of £800.

LIVERPOOL.—The Welsh Presbyterian church, Princes-road, Liverpool, is now ready for reopening. The interior of the church and the organ-case and pipes have been cleaned and decorated. Pitch-pine ornamental glazed vestibules and screens have been constructed at the entrances of the church. The church and vestries are lighted by electric light. In addition, the mission hall and library have been enlarged and carried one story higher, above which contains two spacious classrooms, with lavatories, cloakrooms, stores, and offices. Also, a minister's vestry, with outer walls faced with Yorkshire stone shoddies with Stourton stone dressings, has been built between the latter and the chapel, with store cellars below same. The whole of the work has been carried out from plans and specifications prepared by, and under the supervision of, Mr. F. G. Williams, M.S.A., architect, 3, Cable-street, Liverpool. The total cost is nearly £2,000.

PETERBOROUGH.—New co-operative stores in Park-road are now on the eve of completion. The total cost, including land, is between £11,000 and £12,000. In March, 1889, the first section of the block was opened, the expenditure then having been about £7,000. The architect was originally Mr. T. Hind, of Leicester, and the second section has been carried out by his son, Mr. R. A. Hind. Messrs. Wenlock and Coe built the first portion, and Mr. Wenlock the section now completing. Two shops are now added for drapery and tailoring, and warehouses, arcades, and workrooms have been built. The block has a frontage to Park-road of 113ft., with a total height of 60ft. The Sheringham system of ventilation is used. The heating is by steam throughout from a 6H.P. steel Cornish boiler in the basement. The front elevation is of old red Whitchurch brick, relieved with dressings of Ancaster stone, the pilasters and other exposed parts being of Derbyshire stone. The central portion is executed in stonework. All the cellars are lighted at the front with Hyatt's prismatic pavement lights, and at the rear with windows looking into an open area. The drapery shop measures 20ft. by 40ft., and the tailoring department 18ft. by 40ft., and at the rear of the drapery is erected an arcade, with a glass canopied roof, 42ft. by 21ft. On the first floor is the mantle department, 32ft. by 20ft., with customers' fitting rooms, 14ft. by 8ft., and the tailoring room, 28ft. by 8ft., cutting-up and fitting-on rooms. On the second floor are the dressmakers' working-room, 22ft. by 20ft., milliners' working-room, 18ft. by 13ft., and on the other side (though unconnected) the tailors' room, 18ft. by 28ft., machine-room, &c. On the upper floors are library and reading-room, and a large assembly hall. In the roof are store rooms. The warehouses run a length of 68ft., and a mess-room for the operatives has been provided.

PORTMADOC, N. WALES.—A new Presbyterian chapel and school are to be erected at Portmadoc, from the designs of Mr. T. Taliesin Rees, A.R.I.B.A., of Birkenhead. The chapel is to accommodate 300 persons, with provision for future gallery. The schoolroom is to seat 150 persons, and the further accommodation includes kitchen, minister's vestry, heating chamber, &c. The style is Gothic, with traceried windows. The materials will be of local stone, with red Runcorn stone dressings and tracery. The interior will be finished in pitchpine. The contract has been let to Mr. John Shaw, of Birkenhead.

WETHERSFIELD, ESSEX.—A group of almshouses has just been completed, and has been erected at the sole expense of Mr. Arthur Henry Gower, of Ipswich, as a memorial to his parents, who many years ago resided at Wethersfield Hall. The range consists of four houses, raised on a terrace, each having a living-room, scullery, and other conveniences, with verandah both back and front. The style is Elizabethan, harmonising with the ancient architecture of the village. The cost has been about £1,000. Mr. E. F. Bisshopp, of Museum-street, Ipswich, was the architect, and the builder Mr. Alfred Brown, of Braintree.

The Duke of Devonshire and Mr. Littler, Q.C., are about to open a large institute in Priory Park-road, Kilburn, recently acquired by the Middlesex County Council under the Technical Education Scheme, to be used as a Polytechnic for evening classes for the parishes of Willesden and Hendon. The sum of £3,400 has been paid for the building, and to this sum the Willesden and Hendon Urban District Councils have contributed. Already there are 250 pupils at the classes, which have been open a month. The building-trade classes are especially well attended; and plumbing, science, engineering, shorthand, and many other subjects are taught.

At Tuesday's meeting of the London County Council, the recommendation of the Highways Committee for the purchase of the undertaking of the London Street Tramways Company was considered. An attempt was made to postpone a decision on the matter; but a resolution to carry out the committee's recommendation was pressed, and carried by seventy-six to four. The chairman announced that, as these numbers did not comprise two-thirds of the Council, the resolution was lost.

The Lord Provost's Committee of Edinburgh Town Council held a special meeting, on Monday, in reference to the Jeffrey-street Bridge scheme. Before coming to a final decision, it was resolved to remit to the burgh engineer to prepare and submit a cartoon showing how the proposed bridge would affect the Calton Rock at its northern end, and to report, in consultation with Sir William Arrol, as to the probable cost of the bridge, including the acquisition of the necessary property in the line of construction.

OBITUARY.

We regret to announce the death of Mr. John William Trounson, F.R.I.B.A., F.S.I., M S.A., which occurred suddenly on Friday night at his residence in Clarence-street, Penzance. Deceased had been suffering during the last few days from pneumonia, but a fatal result was not anticipated. Mr. Trounson, who was the son of Mr. Trounson, builder, of Penzance, had an extensive practice as an architect throughout West Cornwall, and had carried out some important works, including the mansion of Boskenna at St. Buryan, now the restdence of Captain Paynter; the the additions to St. Peter's, Newlyn; the Jubilee memorial extension of St. Paul's, Penzance; the new Wesleyan Chapel, at Penryn; Pike's Hill Wesley School, Falmouth; the Bible Christian School, Heamoor; various board schools in Cornwall; Messrs. Chudleigh's premises at Johannesburg; and the recently-opened extension of the Penzance Wesleyan Day Schools. At the time of his death Mr. Trounson was engaged in carrying out an extensive commission for Mr. Barney Barnato, the African millionaire. He became a Fellow of the Royal Institute of British Architects in 1888, a Fellow of the Surveyors' Institute in May, 1891, and three years later was elected a member of the Society of Architects. Mr. Trounson, who was 46 years of age, leaves a widow and three children.

The death is announced of one of the senior members of the architectural profession, Mr. Thomas Cundy, F.R.I.B.A., formerly in practice in Grosvenor-gardens, Pimlico. Mr. Cundy, who died on Tuesday week at his residence, 2, Chichester-terrace, Brighton, was the son of an architect, and was elected a Fellow of the Royal Institute of British Architects in 1857, his proposers having been Professor T. L. Donaldson, Philip Hardwick, and his father, all long since deceased. He had served on the council of the Institute, and took an active part in the administrative work of the Architects' Benevolent Society.

Mr. J. H. Chapman, a well-known architect of Boston, Mass., and senior member of the firm of Chapman and Frazer, died suddenly at Fredericksburg, Va., a fortnight ago. Mr. Chapman was born in New York, and was a graduate of Yale College. He studied in the Sheffield Scientific School, and in the Royal Academy at Stuttgart, Germany, receiving his practical training in the office of Ware and Van Brunt, in Boston. In connection with Mr. Frazer, he carried out many large works near Boston, together with the Merchants' Bank Building, New Bedford, the Concord High School and the Episcopal Church in the same town, and the State Armoury at Nashua, N.H.

Mr. Richard J. Langridge, past-president of the Alliance Cabinet Makers' Association, died on the 6th inst. at his house in Libra-road, North Bow, aged 65 years. He was one of the originators, and for some time was secretary of the Trade Guild of Learning.

CHIPS.

The opening by the Duke of Devonshire of the new Home (the "Passmore Edwards House") at the colony of the National Society for the Employment of Epileptics at Chalfont St. Peter's, which was postponed from the 7th of August last, owing to the Duke of Devonshire being summoned to Osborne on that day, has now been fixed to take place on Tuesday, the 26th inst., at a quarter to three o'clock.

Professor Johannes Overbeck, the well-known Leipsic archæologist, and nephew of the celebrated painter, died at Leipsic on Friday, at the age of 69. His numerous works on Art and the History of Art will long keep his name in remembrance.

A memorial to the Irish Chief Secretary is being numerously signed praying for Government assistance towards providing railway extension from Clonakilty to Rosscarbery. The County Cork grand jury passed a sum of £25,000, with a baronial guarantee, provided the Treasury contributed £20,000.

A Roman Catholic church, dedicated to Corpus Christi, is being built at the rear of the Convent of the Cross at Pokesdown, near Bournemouth. It is Early English in style, and will cost £6,000. Mr. William Lune, of Malvern, is the architect, and Messrs. Jenkins and Sons are the contractors.

There has been erected in the salon of the Hotel de Ville at Paris a chimneypiece of white marble, the work of a syndicate of "Ouvriers Sculpteurs," the cost of which is between £11,000 and £12,000.

COMPETITIONS.

Bangor.—The award of the assessor, Mr. W. D. Caröe, M.A., F.S A., the architect to the Charity Commissioners, in the competition for the Carnarvonshire School for Girls, was published on Friday. Of the seven sets of plans sent in for competition he considers No. 5 to be the best. The author of these plans is Mr. John H. Phillips, M.S.A., St. John's Chambers, Cardiff. Mr. Phillips, it will be remembered, was also the successful competitor in the recent Tate competition, when he received the first prize offered for the best plans for Welsh Intermediate Schools.

Durham.—The question of the designs for the proposed new county buildings in Durham city was discussed by the Durham County Council at their last meeting. A report was received from the finance committee stating that they had revised the adopted plans of the buildings, and had made some alterations calculated to improve the general arrangements, and to keep the cost within the limit fixed by the council. They had directed the buildings to be faced with terracotta in front, and brick at the back. A quantity surveyor had been appointed, and the architects, Messrs. Barnes and Coates, had been instructed to make all necessary preparations for advertising for tenders in the early part of December. The clerk then read the correspondence which had been received in relation to the matter. The Royal Institute of British Architects had written expressing regret that Messrs. Cooksey and Cox, who were first in the competition, had been deprived of the opportunity of executing their design. Messrs. Phillip Tree and Ivor Price, honorary secretaries for the protesting competitors, had forwarded a memorial, in which it was stated that a gross injustice had been done to honourable professional gentlemen by their being set aside, without any valid reason, as if incompetent and unworthy, and local men, more or less unknown, substituted, who by the assessor's award had not earned the honour of being intrusted with so important a public work. They asked the council to remove this most unmerited slur and bitter disappointment by intrusting Messrs. Cooksey and Cox with the work they fought for and so gallantly won. The same gentlemen also wrote inclosing a communication from Mr. J. Vickers Edwards, the assessor in connection with the competition, stating that the designs of "Onward" (Messrs. Cooksey and Cox) were by far the best, and won purely on merit. That the one marked "Demos" (Messrs. Barnes and Coates, Sunderland) ought to have been disqualified, as the regulations issued to competing architects had not been complied with, and that, therefore, Messrs. Cooksey and Cox had not received the fairplay and justice to which Englishmen were entitled. There was also a letter from the Northern Architectural Association, Newcastle-on-Tyne, protesting against the action of the council, and pleading in favour of "Onward's" plans. The chairman, Mr. S. Storey, observed that the Institute of Architects admitted that the council had acted legally, and he should try to convince the council that they had acted according to the dictates of common-sense and for the best interests of the ratepayers. In regulation 28 it was stated, "If the estimate exceeds £22,000 the design will not be eligible for premium, and special consideration will be given to plans which can be carried out at the lowest cost." Again, regulation 34 read, "The council does not bind itself to carry out the works shown on the selected designs, nor to employ the successful competitor if it does so." That meant that the council need not use the plans, although they had paid a premium for them, or they might use them, and employ someone else to carry them out. Regulation 35 stated that the "council will appoint a competent architect as assessor to assist in selecting a design, and the council is to be at liberty to reject all or any of the designs." Other conditions stated that the council reserved full liberty with respect to all proceedings in connection with the erection of the building, and also that the council should be at liberty to reject the whole or any of the designs if they appeared ineligible or of too expensive a character. Such being the conditions sent to every competitor, and upon which every competitor sent in his plans, it was manifestly improper to urge that the council had done wrong either in not adopting the plan that got the first premium, or in not being guided solely by the opinion of the assessor, and the facts of the matter were that a certain number of plans were sent in, were received by the County Council surveyor, and placed at the disposal of the assessor. He (Mr. Storey) communicated with the clerk, and asked him to fix a day for the assessor to meet the committee. The reply they got was a formal award by the assessor, who had neither met nor consulted with them, in favour of three plans. The committee declined to receive that award, and they laid it upon the table and communicated with the assessor to the effect that he had exceeded his authority; that what they wished was that he should meet them, and, whilst he could advise the committee on many points, the committee thought that they could advise him as to the internal arrangements which would be most suitable and convenient for their own business. The assessor came to the committee meeting, and the whole matter was discussed. Another meeting was held, and the committee finally decided that the first premium should be given to "Onward," and the second to "Demos." They reported that to the council, the council accepted, the premiums were paid, and the council had possession of the plans. The committee, reinforced, met, and decided that the second plan was, on the whole, the most convenient internally, and was likely to cost a considerable sum less. Believing the second plan would be more economical, they adopted it, and the council agreed. It might be said the plan they had adopted did not comply with the regulations issued to competitors. Now, he had Mr. Edwards's report before him, and there was no statement to the effect that the plan in any way did not comply with the instructions, and there had been no statement to them verbally by Mr. Edwards. The second point to be urged against them was that they had adopted plans which, architecturally, would be a discredit to the council. In answer to this, Mr. Storey, after remarking that fortunately architects, like doctors, differed, read an extract from the Building News, an authority on architectural matters, which contained a somewhat technical criticism of the plans adopted, but couched in eulogistic terms. In reply to Sir Theodore Fry, the Chairman said: "There is £4,000 difference between the cost of £22,000 and £18,000." The report was then adopted.

Laying-Out Victoria Park Estate, Kirkstall.—The Victoria Park Estate, situated at Kirkstall, near Leeds, and comprising 52 acres of land, is about to be laid out by Messrs. J. Bexon and Son on behalf of the owner as sites for cottage property. It is intended that the dwellings shall be built in pairs, with small gardens attached, at a cost of £350 or £400 per pair, and that ground shall be reserved for public buildings, such as places of worship, schools, a reading-room, a hotel, and shops, and likewise for cricket, tennis, and bowls. Prizes have been offered for the best designs for streets and for houses, and these have been awarded as follows, by Mr. Charles Gott, M.Inst.C.E., F.S.I., Bradford:—Designs for new streets, &c.—1, Mr. Albert, E. Dixon, A.R.I.B.A.; 2, Mr. George Birkinshaw (South Milford); 3, Mr. John A. Webster; 4, Mr. Tom Dyer. Designs for houses:—1, Mr. Tom Dyer; 2, Mr. J. W. Thackray; 3, Mr. John A. Webster; 4, Mr. George Birkinshaw (South Milford).

Linslade.—The Linslade Parish Council, at a meeting on Friday last, awarded the first premium for the competitive designs for the sewerage and water supply of the district to Messrs. R. B. Grantham and Son, Northumberland-avenue, London, and the second premium to Mr. H. B. Nichols, of Birmingham. The rateable value of the district is about £20,000, and the estimates of cost varied from about £3,200 to £9,900.

The Sage House, Brooklyn and St. Mark's Avenues, Brooklyn, N.Y., has been successfully moved by B. C. Miller and Son, house-movers. The building is of stone, about 1,300 tons, built by a son of a Mr. Russell Sage. It has been moved 30ft. towards St. Mark's Avenue, and 20½ft. towards Brooklyn Avenue, and has been raised 2½ft. on its foundations.

A new stained-glass window was unveiled on Sunday week by the Earl of Feversham in the north aisle of Helmsley Church, making the fourth stained window in the aisle, all of which are historical. The new window is a three-light Late Decorated one, with figures of the principal persons who took part in the Battle of the Standard, fought near Northallerton, in August, 1138. As in the other windows, prominence is given to Walter Espee, described by Ældred, the third Abbot of Rievaulx, as the hero of that great event.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Leeds and Yorkshire Architectural Society.—The opening meeting of the twentieth session of the Leeds and Yorkshire Architectural Society was held on Monday night at the Queen's Hotel, Leeds. Mr. E. J. Dodgshun (the president) occupied the chair, and there was a large attendance. The President, in his address, said they had had under consideration the schedule of charges at present in vogue in the profession. The R.I.B.A. Council did not make many suggestions, and with the exception of two or three alterations in the existing schedule, no further alteration was thought necessary. Still, he believed it would occur to some of them that the present method of payment was not always quite commensurate with the amount of work done. If 5 per cent. was a reasonable charge, and none of them liked taking less, for preparing plans and superintending the erection of a large mill, or a huge block of warehouses, or a row of cottages where there was a multiplicity of the same features, surely it was quite inadequate payment for a church or a good house, where every stone almost, and every bit of joiner's work, to say nothing of the other trades, required the most careful thought and consideration in detailing. No doubt it was convenient to charge by percentage, especially as it had become a recognised custom; but to stick to 5 per cent. for everything was not quite fair. Recently the council criticised the conditions issued by the Leeds Guardians of a proposed competition for imbecile wards to be built at the workhouse, and they had forwarded a letter to the clerk, pointing out certain clauses which they should like to see either excluded or materially altered, and which, if allowed to remain, would prevent many of them competing. He agreed with Mr. F. C. Penrose that it was not necessarily by competition that the best result was obtained. Of course, it was hardly possible to dispense with competitions altogether, but he wished every architect would absolutely decline to enter any competition where the conditions and instructions were unfair or incomplete. Last year he spoke strongly against the city surveyor of Leeds undertaking the architectural work. He was now informed that the corporation had decided that in future the city surveyor should not be called upon to do architectural work, but that it should be competed for by architects. He wished they would go a step further and appoint a city architect, or if that was not convenient, give the work out to responsible architects in the town. Mr. H. Perkin moved a vote of thanks to the president, which was seconded by Mr. W. S. Braithwaite. The president then distributed the prizes to the successful students. The silver medal and five guineas, given by the president, were gained by Mr. R. Whincup, for a set of drawings of Skelton Church, near York. Two prizes were awarded to Mr. F. Musto, one for a design of a country house, and the other for sketches. Another prize was presented to Mr. C. W. Tomlinson for an essay on "Chimneys," with illustrations. A smoking concert afterwards took place.

Sheffield Society of Architects and Surveyors.—The monthly meeting of this society was held at the School of Art on Tuesday evening. Mr. Paul Waterhouse, M.A., F.R.I.B.A., of London, read a paper on the "Brotherhood of Architects." In his opening remarks, he pointed out that isolation is no more possible to the architect than to human beings generally; but that he is inseparably connected with his fellow-craftsmen in the present and the past. He urged upon all present the desirability—the necessity of promoting by every possible means, by personal influence, and by personal enthusiasm, such a spirit of unity and mutual assistance as would most truly make for the ideal brotherhood of architects.

* * *

A receiving order in bankruptcy has been made in the case of Alexander M'Clymont, of Cathcart-road, South Kensington, builder.

The Burgh Commissioners of Arbroath, stimulated to a reversal of previous action by the results of a recent election, unanimously agreed on Monday to rescind a resolution passed at the October meeting of the board, remitting to the water committee to secure the services of Mr. Wilson, C.E., Edinburgh, in looking out for a gravitation supply of water for the town. The water committee were now instructed to take steps with a view to the augmentation of the existing underground supply, and to report to the board.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—E. Falconer.—J. G. C.—E. Peacock.—E. B.—F. A. and Co.—G. K. (Ramsgate).

"BUILDING NEWS" DESIGNING CLUB.

SECOND LIST OF SUBJECTS.

B.—A Small Public Bath, adapted also for use as a public hall, with four first-class and six second-class slipper baths, the baths to be used on alternate days by men and women. The bath hall to have a distinct entrance from the bath proper, with emergency exits for use only when the bath hall is used for public meetings, for which purpose a separate staircase from the gallery will be required. The swimming pond is to be 80ft. long by 28ft. wide in the clear; w.c.'s, &c., to be provided for each of the sexes. A small office and a pay-office to be provided. The site is in a street with a frontage of 55ft. and a depth of 130ft., having a back right-of-way 10ft. wide leading to the next thoroughfare. The bath proper to be towards the main frontage. Accommodation required for the caretaker's rooms, and a small board-room to be provided. A simple treatment for the façades to be adopted, suitable for brick and stone, and slate roofs. The position of boiler place and fuel store to be clearly shown. Elevation, and two sections, and necessary plans with a perspective view. Scale of elevations and sections $\frac{1}{8}$in. to the foot, plans 1-16in. to the foot. Plans of roofs optional. Skylights to be dotted on ground plan.

Drawings Received. — "Tadpole," "Blackbeetle," "Beckington," "Thrush," "Ivy," "Albyn," "Canary," "Peep Bo," "La Cigale," "Moor," "Dono."

Correspondence.

PROPOSED NATIONAL AND PROVINCIAL UNION OF BRITISH ARCHITECTS.

> "To thine own self be true;
> And it must follow as the night the day,
> Thou cans't not then be false to any man."
> —Shakespeare.

To the Editor of the Building News.

Sir,—No profession or trade was ever so sadly in need of protection from within and from without, as the present architectural.

No profession or interest was ever face to face with so many glaring incongruities, difficult problems, or monstrous anomalies in regard to position, pay, and patronage.

No other profession, or even trade, ever tamely submitted year after year to occupy such a false position, or permitted such flagrant injustice and gross wrongs to flourish on every side unchecked. Such exactitude from the public in general, and such an unproportionate return on their part in the ordinary remuneration tendered. But why multiply *ad nauseam*? Who, in the profession, is not too fully cognisant of these facts!

Looking back for about 30 years, we there witness the profession holding no very enviable position; but, on the other hand, what do we find to-day? Why, something infinitely worse! Whilst other interests have been fortifying and strengthening their positions, architects have made no progress whatever; they have not even remained stationary, but have gone from bad to worse.

During the above period, over and over again your columns have exposed cases of the grossest injustice, petty tyranny, barefaced extortion; wrongs made doubly hard to endure in that there was no appeal, no means of redress, all alike disastrous to the individual, and the best interests of the profession at large. Yet virtually these have practically been allowed to pass almost unnoticed — disregarded — and why? For the simple reason that there was no fully representative, sympathetic official body to which appeal might have been made—a body constituted bold and powerful enough to successfully cope with the difficulty, and thus uphold and vindicate the rightful interests and true position of the profession.

Surely if ever a body of men following an honourable calling were in want of a fully representative and complete organisation, that body is the architectural profession of this country. It may well be asked: Will architects as a body continue for ever simply to stand and individually be ignominiously pelted at by any outsider? Surely it is high time to sweep away the shame and disgrace attending such a false position.

The bare fact of the existence of an organisation as suggested above would undoubtedly exercise a most salutary effect upon the public mind, act and react, and prove one of the surest and strongest of levers to elevate and determine the true position and standing of architects; lift into its proper sphere the individual and collective status of architects, and place it in that honourable position to which it is so justly entitled. And this would ultimately render impossible many of the worst abuses which now are too common.

There is but one practical way of attaining this object. In the first place, all minor differences and objections must be sunk, and a loyal support given to a federation of architects comprising the whole of the profession. Surely its simple practicability must strongly commend it to all, and as far as objections of any weight are concerned, I fail to discover them. But, on the other hand, the benefits likely to accrue are innumerable, especially when we consider that such a body, powerful enough for the first time, will be able successfully to cope with and effectually veto so many of the present glaring inconsistencies. Such we may enumerate as the ordinary remunerative tariff in practice—I don't mean on paper—protection from unqualified practitioners, unjust and unprofessional competition, and that for ever an end may be made to the scandalous disgrace and loss too often attending the present system (?) of public competitions, with its cruel extortions of time and money, not to mention "the spurns that patient merit of the unworthy takes," all of which can unmistakably be traced to no other source than the nonexistence of a strong fully representative body, embracing the whole of the members of the profession, duly authorised and instituted solely for its mutual protection and benefit. And certainly it is difficult to understand why for so long this has remained unaccomplished, seeing that architects hold the remedy in their own hands. Surely, to go on as we are is not only a disgrace and a dishonour, but an infinite loss. Apparently some are inclined, as a forlorn hope, to pin their faith to Acts of Parliament. But whatever benefits or advantages might accrue from such, that power would certainly be made doubly effective following in the wake of a strong federation of architects, who have first determined within themselves to look after their own interests.

But a great majority seem never to have fully realised their individual responsibility, without which a large measure of all effort for amelioration will of necessity prove abortive. Or is it because there has never been suggested an easy practical way of demonstrating their sense of obligation? Is not the latter the main cause?

Granted, then, that there is a want, a crying want, for a union of architects, we may very reasonably ask, in what way can this desirable end be most easily and effectually accomplished?

In the first place, the qualification for membership ought to be as comprehensive as may be compatible with the dignity of the profession, and undoubtedly it should be open to all *bonâ fide* members practising in England, Scotland, and Wales.

In the second place, this body incorporate, to be an effective and efficient force, must, as a *sine quâ non*, be vested with full and unfettered powers to be exercised by the collective representative executive of its entire membership. As it will, if constituted as above, embrace in its ranks every architect in the country, it will include all the members of the Institute and other architectural societies—thus there will be no preponderance of power in any section of its membership, but each having a voice and equal representative power of voting on all vital questions. Provincial and city practitioners will alike participate and reap similar benefits and advantages, and thus inaugurate the fashion of less without and more within.

The country to be divided into provinces, the City forming one, and again each province subdivided into districts, with one or more representatives from each. General half-yearly meetings to be held in London, and an annual conference at different important centres.

Financially embracing, as this organisation is proposed to do, the whole of the practitioners in Great Britain by this combination, the necessary subscriptions will be reduced to a minimum—say, an annual subscription of 5s. in advance, which, if paid in the first instance within a given period of the founding of the union, will likewise include entrance fee, which after that date would be an extra 5s. This would cover the annual cost of general working expenses, of management, &c.

As to the present societies—including the Institute and other excellent architectural associations—all will be stimulated and strengthened in their individual influence and growth by this defensive movement, their status considerably heightened, and their laudable efforts for the higher technical training and artistic elevation of the profession receive a strong impetus. It is, therefore, hoped that members will cordially and unanimously co-operate in the furtherance of this movement. *Decus et tutamen.*

As the matter now stands, surely no one can honourably escape liability and remain passive. We must either approve or disapprove of the present situation. If the former, it will be interesting to hear what can be said in its favour; but if of the latter, do not let us shelve our individual responsibility, but let it be loyally and equally distributed amongst all. And what are we called upon to do? Why, in the very simplest possible way to unite in asserting and defending our just rights, which at present are notoriously neither asserted nor defended, and too often simply ignored—more honoured in the breach than in the observance.

I shall be glad to receive the names of all who are in sympathy with this movement on the above or similar lines, and it is most desirable that, preliminarily, we should signify our approval and unite in such numbers as will justify its immediate development. Needless to add, that any practical suggestions likely to prove useful will be most welcome.

Before closing, I cannot let this opportunity pass without bearing testimony, Mr. Editor, to the untiring solicitude and sincere interest reflected in your columns throughout the whole of the above period. You have ever been foremost in exposing abuses and suggesting remedies; but, unfortunately, the latter have never been responded to as they ought and carried into effect. Thanking you in anticipation,—I am, &c.,

George Ord.

16, The Avenue, Durham, Nov. 7.

SPELLING OF TECHNICAL TERMS.

Sir,—Having had occasion lately to turn my attention to the spelling of technical terms used in architecture, I have found that there are a good many words of which the spelling commonly or often adopted is either anomalous or without good authority. I give below a list of the most common of such words.

Asphalt.—This word seems to be usually spelt with a final *e*, as it is in French. English dictionaries, so far as I know, invariably spell it without the final *e*.

Clearstory.—It is difficult to understand why this word should be spelt *clerestory*, as it generally is, contrary to etymology.

Fascia.—This appears to be, etymologically, the correct spelling, as I do not think there can be much doubt that this word is derived from *fascis*, a band, and that it has nothing to do with *face*.

Mortise.—This, and not *mortice*, appears to be the correct spelling.

Pozzolana.—This is a purely Italian word, and if we admit that the Italians know how to spell their own language, it should be spelt as above, and not *pozzuolana*, as it is frequently found in English books. The latter spelling is taken from the spelling of Pozzuoli, where it is procured. If the English spelling is to differ from the Italian, it would surely be better to spell it phonetically, and call it *potsolana*.

Sill.—There seems to be no good authority for spelling this word *cill*.

Siphon.—This word is pure Greek (σίφων), and the spelling *syphon*, which is so common, is undoubtedly incorrect.

Story.—This is the recognised spelling. There seems no good reason for inserting an *e* before the *y* when this word is used with reference to a building, and thereby introducing an unnecessary complication into the spelling of a common word.

Spandrel.—This spelling appears to be more consistent with the analogy of words having a similar termination than the spelling *spandril*, for which I can find no good authority.

Style.—Etymologically this, and not *stile*, appears to be correct, as the word is derived from *stylos* (a column).

In addition to the above, I may mention the words *bracketing*, *riveting*, *strut*, *wainscot*, which are very often spelt with a double *t*, without any reason whatever. On the other hand, the word *tesselated* (from *tessella*, a small cube) has been deprived of an *l* with just as little reason.—I am, &c.,

Gavin J. Burns, B.Sc.

* * *

At a special meeting of the Chatham Town Council, on Thursday in last week, it was decided to give £1,680 for the widening of the High-street, near the Military-road.

The new corporation hospital for infectious cases of disease at Burton-on-Trent was opened on Friday. The institution consists of a series of blocks, which are situated on a terrace on the northern extremity of the Outwood Hills. There are six buildings, including wards, and an administrative block. The total cost, inclusive of the land, is estimated at £11,000. The buildings were designed, and their construction superintended, by the borough surveyor, Mr. J. E. Swindlehurst, C.E., and the contract was carried out by Mr. Hodges, Burton.

A pulpit erected in All Saints' Church, Falmouth, as a memorial, was dedicated on Thursday in last week by Archdeacon Cornish. Standing on a stone platform, the pulpit, with its circular front, is supported by a large Devon green marble shaft, surrounded by seven different coloured marble shafts, some twisted, others octagonal and circular. The body is formed of Derbyshire alabaster, inlaid with slabs of Devon marble of different shades, while the circular front has a floriated cross of white marble on a background of red marble. On either side are two figures, St. George and St. Piran, carved in Italian white alabaster. Messrs. J. and E. Goad, of Plymouth Phœnix Marble Works, have executed the work to the plans of Mr. Sedding, of Plymouth.

An adjourned inquest was held at Trentham on Monday, on the body of Hugh Perkin, joiner, Boothen, who was killed on the 25th ult. by a wall collapsing during some alterations at the Trentham Old Inn, which were being carried out by Messrs. Tomkinson and Betteley, builders, the deceased's employers. Mr. E. Penn, architect, Stoke, said he had examined the wall, and found the mortar fairly good. The wall could not have fallen had it been supported by plenty of sprags during the alterations. Mr. Thomas Roberts, architect to the Duke of Sutherland, stated that it was a mystery to him how it had fallen. Mr. E. L. Maddock, architect, Hanley, said that from the condition of the wall he should have had no hesitation in making the alterations which were being executed by the contractors for the work. The total height of the wall was only 5ft. odd, and it was a wonder to him how its fall could have killed a man. He should not have thought it at all necessary to sprag the wall. The jury returned a verdict of "Accidental death," expressing the opinion that every reasonable precaution had been taken by the contractors, that the wall was apparently sound and good, and fitted for its purpose.

Intercommunication.

QUESTIONS.

[11448.]—**Tensile Breaking Strain of Tie-Rod.**—Can any reader kindly say what is the tensile breaking strain (in tons) on a ¾in. round iron tie-rod, 38ft. long?—Q. E. D.

[11449.]—**Foundation Soils, Resistance of.**—Where can I find any authoritative information on this important subject? Does Rankine say anything of it? I thought there were some papers (forming part of a series on construction) in the Building News, but I cannot find them.—W.

[11450.]—**Concrete Floors.**—If broken brick is used for concrete filling-in between iron joists for floors above ground-floor level, what proportion of sand should be used? Specification reads: "Concrete to be composed of broken and Portland cement 4 to 1." Is concrete composed of broken brick cheaper than if composed of coke breeze? If coke breeze is used, should sand be mixed with it? Would broken brick and coke breeze mixed together make good concrete?—Doubtful.

[11451.]—**Dry-Rot.**—Twelve months ago I laid a basement floor, first filling in 16in. broken stone, then 6in. coke breeze, composed eight of screened coke to one of Portland cement, on to this composition was laid 1in. floor boards. Since being occupied they have covered these floors with carpet or linoleum. I now find that already the boards are going in dry-rot. Is this the fault of boards being imperfectly laid in composition, the fault of being covered with linoleum, or is the whole principle wrong? What suggestions could any reader kindly offer, and how best to remedy?—Grange-over-Sands.

CHIPS.

New parish schools are being built at the corner of Broadbridge-street and the New Avenue, Peterborough. They will accommodate 800 girls and infants, and will be built of white brickwork. Mr. John Thompson, J.P., of Peterborough, is the contractor.

St. Bartholomew's Church, Southsea, a comparatively recent structure, was partially wrecked in Monday's gale. The wind dislodged a heavy stone cross and a portion of the coping, which crashed down on the roof of the chancel and vestry, doing extensive damage.

The reopening services at the Prince's-road Welsh Presbyterian Church, Liverpool, were held on Saturday. The church has been cleaned and decorated, the building now being illuminated by means of the electric light. The organ has also been overhauled. New rooms have been added to the schools, and additional vestries have been erected. The work has been carried out from plans prepared by Mr. T. G. Williams, architect, of Cable-street, Liverpool.

The governors of the Northern Polytechnic Institute, Holloway-road, have appointed as principal Dr. J. T. Dunn, head of the Plymouth Science, Art, and Technical Schools, and formerly of the Gateshead School, and inspector of science schools and classes for the Durham County Council.

The town council of Shrewsbury adopted on Monday plans and estimates prepared by Messrs. John Taylor and Sons and Santo Crimp for a new sewerage scheme for the town. The total cost is put down at £67,500, which includes £685, the cost of land necessary for a sewage farm.

The members of the Sanitary Institute inspected the sewage and destructor works at Ealing, under the guidance of Mr. Charles Jones, M.I.C.E., engineer and surveyor to the Ealing Urban District Council, and on Tuesday evening a lecture was delivered at the Institute by Mr. J. Wright Clarke on the subject of "Details of Plumbers' Work."

The walls and roof of the Wesleyan Chapel at Skelmanthorpe, which was built in 1815, having been found to be unsafe, it has been decided to pull down the building and build a new chapel. Plans and tenders have now been accepted for the erection of a new chapel, at an estimated cost of £1,700.

A new clock and bell have been presented to the Rothwell, Yorks, new District Council Offices, by Mr. Thomas Hargreaves, J.P., Lofthouse, chairman of the District Council, Rothwell, in memory of his father. The clock was set going on Wednesday week. Messrs. W. Potts and Sons, clock manufacturers, of Leeds and Newcastle, are the makers.

The Dover Corporation resolved on Monday to apply to the Board of Trade for the necessary powers to enable them to construct electric tramways throughout the borough, the majority of the main streets being scheduled. At Sandwich negotiations are being carried on by the town surveyor with the landowners for the construction of a tramway to the seaside, a distance of two miles.

The new board schools at Ford, Devonport, will be opened by Sir George Kekewich to-morrow (Saturday). They have been built by Messrs. A. Lethbridge and Son, of Plymouth, from plans by Messrs. Hine and Odgers, of the same town.

Legal.

VESTRY AND SEWER.

THERE is no doubt that the Public Health Act (London), 1891, is already shown to be in need of amendment. This is especially so in regard to the repair of sewers by a vestry or other sanitary authority; for it appears that the statute provides no machinery whatever by which such an authority can be compelled to keep its sewers in order. In truth, the whole Act from beginning to end regards the sanitary authority as always being in the position of a complainant, while the possibility of its being a defendant has been entirely overlooked. The point was raised at the Lambeth Police-court in a recent case reported in our issue of last week (Nov. 8, 1895). There the owner and leaseholder summoned the vestry of St. Mary, Newington, for neglecting to repair and amend a certain sewer in the Gurney-road. It appeared that the houses are drained upon a combined system, several houses being served by the same pipe connection with the sewer in the roadway. The complainant contended that this being a combined drain, to the construction of which the consent of the local authority had never been given, the vestry were liable for its repair. On the other side, it was argued that owners of this class of property had, since a recent decision, been trying to throw upon the vestry the onus of doing such repairs, and that, at all events, the sanitary authority could not be proceeded against under the statute as it stood at present.

The magistrate, Mr. Hopkins, said the first question was whether or not this was a sewer, or only a drain common to the houses. He decided that, as a matter of fact, it was a sewer, and he held that the onus of proving its character was upon the vestry. But he could find no power in Section 12, or in any other part of the Public Health (London) Act, 1891, to compel the vestry to repair this pipe. Although the magistrate held that it was a sewer for which the vestry were liable, he could not make any order under the Act, and so the summons had to be dismissed; but as he was against the defendants on the facts and the merits, he declined to allow them any costs. There still remains the old cumbrous method of proceeding by indictment; but as far as can be seen, there is no other remedy for an admitted grievance.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Provincial Architect.—Shop.—Extension.—Rights.—I do not know of any such easement under English law. But the matter is further complicated if you go beyond your own line of frontage. If there was his name on the pilaster, the adjoining owner would have a better ground of claim.

CHIPS.

Councillor Kitching, builder, who has been a member of the Darlington Town Council for some years, died from pneumonia on Saturday night. Mr. Kitching was ill during the late election, but he was re-elected by a good majority.

The new board schools, Sevenoaks, Kent, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and vertical inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A statue of Edward Colston, the benefactor to Bristol charities, which has been erected on the open space at St. Augustine's, Bristol, was formally unveiled on Wednesday. The statue is the work of Mr. John Cassidy, of Manchester.

The Bird-in-Hand Hotel in the Long Causeway, Peterborough, is being rebuilt from plans by Messrs. Stevenson and Dorman, of Durngate-chambers, Northampton. The front is of Weldon stone and red brickwork. The contract has been taken at £3,100 by Mr. Henry Martin, of Northampton.

The Duke of Devonshire will visit Birmingham to open the New Technical School and distribute the prizes on December 13. The school covers an area of 110ft. by 210ft., and is six stories in height. The style is English Renaissance, and the façades are of teak, with terracotta dressings. The architects are Messrs. Essex, Nichol, and Goodman, of Birmingham; and the contractors Messrs. Sapcote and Sons, of the same city. The cost has been about £60,000.

LEGAL INTELLIGENCE.

Nottingham.—A claim for £7,740 made by Messrs. Brooke and Dearnley, shoddy dealers, having premises off Arkwright-street, Nottingham, against the Manchester, Sheffield, and Lincolnshire Railway Company has been settled by arrangement between counsel. The company will give the claimants £3,100 for so much of their land as is required for the construction of the railway. In the case of John Grundy's trustees against the company, the claimants have accepted the company's offer of £6,500 for the Guildhall Tavern, situated between Bridlesmith-gate and Fletcher-gate, and adjoining premises.

Important Warwickshire Arbitration in London.—Mr. Daniel Watney, president of the Surveyors' Institution, sat at Westminster on Friday as umpire in the case of "Lady Hood's Trustees v. the Manchester, Sheffield, and Lincolnshire Railway Company," a claim for about £7,000 for compensation for land taken from the Hood Estate near Braunston, four miles from Daventry and nine from Rugby, for the purposes of the new trunk line. Mr. John Bird, Huntingdon, was the arbitrator for the claimants; and Mr. A. M. Dunlop, Westminster, for the Manchester, Sheffield, and Lincolnshire Railway Company. Mr. Elwell, chief surveyor to the Great Northern Railway Company, and consulting surveyor to the War Office, and Mr. Denston Gibson (Messrs. Chesshire, Gibson, Fowler, and Wharton), 98, New-street, Birmingham, were the claimants' expert witnesses. On behalf of the Manchester, Sheffield, and Lincolnshire Railway Company, Mr. Arthur Vernon, High Wycombe, and Mr. Arthur Garrard, of Messrs. Buckland and Garrard, Old Jewry, London, E.C., were the principal experts; and their estimates were about £3,200. The case was adjourned.

Clergymen and Dilapidations.—The Queen v. the Bishop of Hereford.—Mr. Dibden moved on Saturday, in the Queen's Bench Divison, on behalf of the former vicar of Ditton Prior, for a rule *nisi* calling upon the Bishop of Hereford to show cause why he should not hear and determine upon the vicar's objections to the diocesan surveyor's report of dilapidations. Counsel said that the question at issue raised an important principle, which applied all over the country, the bishops of several dioceses having laid it down of late that they had no power to consider objections to the diocesan surveyor's report, and that all they could do was to order a new valuation, which must be made at the objector's expense. This would involve a great hardship to incumbents and vicars. For instance, in the present case the surveyor had valued the dilapidations of articles belonging to the vicar himself, and also serious dilapidations caused by a storm which had unroofed the vicarage after the vicar had removed, and was no longer liable. The Court (the Lord Chief Justice and Mr. Justice Grantham) granted a decree *nisi*, Lord Russell remarking that in his opinion the bishop was wrong.

Arbitration Case at Wardle.—A dispute has just been settled between Mr. Thomas Philip Willan, contractor, of Manchester, and the Wuerdle and Wardle District Council. The dispute arose out of Mr. Willan's contract for laying the sewer from the bottom of Wardle-lane to Halliday-lane, on the high road between Rochdale and Littleborough, and it was referred to the arbitrament of Mr. H. Graham Harris, C.E., partner with Sir Frederick Bramwell, C.E., of Great George-street, Westminster. The arbitrator, Mr. Harris, sat on several days at the Queen's Hotel, Manchester, some months ago and took evidence. The award is in favour of Mr. Willan to the amount of £73 15s., and it will carry costs against the District Council. The original claim was for about £370.

In Re Harry Richardson.—In this case, on which a receiving order was made on Oct. 10, the amended accounts show the liabilities to be £11,942, of which £6,882 are unsecured, with assets estimated to produce £2,689. The debtor has for many years carried on business as a property dealer, builder, and estate agent at various addresses in London. From 1881 to 1883 he had a partner, but has since traded alone. He attributes his failure to losses sustained on speculative purchases and sales of properties, to inability to realise without great sacrifice properties now held by him, to heavy law costs, and to judgment having been recovered against him in March last for damages (£750) for breach of covenant to repair, and for assigning the lease of 28 houses in Ammiel-street, Ammiel-terrace, and High-street, Bromley-by-Bow, respectively, without the consent of the lessors. An adjudication of bankruptcy has been made and a trustee appointed.

A Redhill Arbitration.—At the Surveyors' Institution on Monday Mr. Henry Currey, F.R.I.B.A., sat as arbitrator to assess the compensation payable by the London, Brighton, and South Coast Railway Company to Mr. Rennie for the compulsory acquisition of the whole of his estate at Redhill. The estate in question, which is known as Hooley Lodge, comprises a valuable residential property covering an area of about 12¼ acres, and is required by the company for the construction of the duplicate railway authorised by Parliament in 1894 for the relief of the traffic between Croydon and Brighton. Mr. Bidder, Q.C., who appeared for the claimant, presented the case as one to which the principle of reinstatement applied. Evidence in support of the claim, based upon this principle, was given by several land agents and valuers, who placed the compensation at £19,900. The inquiry was adjourned until Monday, the 25th inst.

Drain or Sewer.—Florence v. Paddington Vestry.—In this case, heard on Saturday before Mr. Justice Chitty in the Chancery Division, the plaintiff had purchased in 1894 the fee-simple of Nos. 149 and 151, Church-street, Paddington. Shortly afterwards he received from the defendants, the Paddington Vestry, a notice to repair a defective drain. The plaintiff accordingly opened up the drain and then discovered that premises at the rear belonging to another owner were drained into the drain. The plaintiff claimed repayment by the defendants of some £47 expended by him in repairing the drain, on the ground that it was a sewer within the meaning of section 250 of the Metropolis Management Act, 1855, and therefore repairable by the local authority, in accordance with "Kershaw v. Taylor" (L.R., 1895, 2 Q.B., 471). It appeared that the connection with the drain was made some 30 years ago, without the authority of the vestry, and merely by the consent of the then occupant of the Church-street houses, no other permission being asked. By section 250 "the word 'drain' shall mean and include any drain of, and used for the drainage of, one building only, and shall also include any drain for draining any group or block of houses by a combined operation under the order of any vestry or district board; and the word 'sewer' shall mean and include sewers and drains of every description except drains to which the word 'drain' interpreted as aforesaid applies." In "Kershaw v. Taylor," a builder had authority to make drains by which the sewage of each pair of four houses he was building was to be carried in a single drain to the sewer, and this was to be done to the satisfaction of the surveyor. The builder made a single drain for the four houses. As the drain did not merely drain one building, and was not created under the order of a vestry or district board, it was held to be a sewer within section 250, and to be repairable, not by the subsequent owners of the houses, who had no notice, but by the local authority. Mr. Justice Chitty said that "Kershaw v. Taylor" governed the present case. The connection here was made without the consent of the local board or the owner of the house. In "Kershaw v. Taylor" a scheme of drainage had been approved by the local authority, but the drains constructed were not in accordance with the scheme. Consequently, in both cases the drain was unlawfully made, and not under any order from the local authority. The connection here was unlawfully made, but the plaintiff did not claim under the person making the unlawful connection. The plaintiff had no notice that anything unlawful had been done. He was not bound to inquire as to another's acts. The plaintiff was entitled to a declaration that the drain was a sewer, and to be repaid the money he had expended in repairing it.

Committee's Promises are Binding.—Graham and Sons v. Mayor, &c., of Huddersfield.—In the Appeal Court on Tuesday, before the Master of the Rolls, Lord Justice Lopes, and Lord Justice Kay, an application was made by the defendants for a new trial of an action tried on July 29 and 30 last before Mr. Justice Mathew and a special jury at Leeds Assizes, or for judgment. The action, which was reported in our columns on Aug. 9 last, p. 211, was brought by the plaintiffs, contractors, to recover £999 11s. 10d., balance of payment due to them from the corporation of Huddersfield under an agreement for the execution of sewerage works. The agreement provided for payments on account, and final payment to be made on the certificate of Mr. Dugdale, the borough surveyor. In the course of the construction of the works it was discovered that it was necessary to tunnel through a mass of rock, and the plaintiffs considered that the cost of such tunnelling ought to be treated as extras. The borough surveyor refused to make allowances for this work on his own authority; but advised the plaintiffs to apply to the Health Committee of the corporation. The committee gave the plaintiffs a promise—which, however, was not reduced into writing—that they should receive proper remuneration for the work in question. At the trial the plaintiffs relied, in the first place, on an alleged certificate of the borough surveyor, but the jury found that no such certificate had been given. The plaintiffs then relied on the parole contract made with the Health Committee on behalf of the corporation. On this issue the jury gave a verdict for the plaintiffs for the amount of the balance claimed. After verdict, counsel for the defendants submitted that judgment ought to be entered for them on two grounds—

first, that the contract relied on by the plaintiffs was not under seal, and therefore was not binding; secondly, that by virtue of section 200 of the Public Health Act, 1875, the committee could not enter into any such contract at all so as to bind the corporation. Mr. Justice Mathew refused to entertain the points so raised, as they had not been taken before verdict. The defendants now applied to the Court of Appeal, and contended that they were entitled to judgment *non obstante verdicto*. They were not bound to take their objection earlier. The objection that the promise given by the committee was not binding on the corporation was properly taken when it was found that there had been such a promise in fact. It was not now a question of admissibility of evidence, but of the legal effect of the finding of the jury. The defendants had no power to waive the want of authority on the part of the committee to make a binding contract, or to waive the necessity for a certificate. They referred to the case of "Lamprell v. Billericay Union." The Court dismissed the application. The Master of the Rolls said that the objection that the defendants had taken their point too late must prevail. In his opinion it was not open to them to take the point now, and the application must be dismissed. Lord Justice Lopes concurred. Lord Justice Kay said that if an action were brought against a corporation on a contract to pay a sum of money on the giving of a certificate, and if the only question at the trial was whether a certificate had been given, and the jury returned a verdict that a certificate had been given, could the corporation turn round and say that the contract was not good because it was not under seal? It was clear that they could not, for they would have waived their objection in court, and, in his opinion, that illustrated what the defendants were trying to do in this case. They had waived the point that the promise of the committee was not binding on them during the trial, and it was too late to do so after the verdict.

Libel Action Against a Surveyor.—Davis v. Hawkins.—In the Queen's Bench Division, last week, before Mr. Justice Day and a special jury, an action was brought by Mr. F. C. Davis, builder, Bromley, Kent, against Mr. Stanley Hawkins, surveyor to the Bromley District Council, to recover damages for slander. Defendant denied that he uttered the words imputed to him. The plaintiff's case was that in January he was negotiating with Mr. Mackinnon, agent of the Equitable Life Assurance Society of the United States of America, for a loan of £6,000 to be made on the security of certain freehold building land at Bromley, and that on the 19th of that month, the defendant, with whom he had had some difference as to some buildings he had constructed, told Mr. Mackinnon and Mr. Hilt that they should be very careful of the dealings they had with plaintiff; that he would not accept plaintiff's cheque and give him a receipt for it until it was cleared; that the land in question belonged to a Mr. Cawston, plaintiff being one of a Mr. Cawston's dummies; and that plaintiff at the time was under a penality of £2 a day for defective building work. Plaintiff said there was no ground for the statements made by the defendant. After the evidence had been heard, the parties came to terms. The defendant tendered an apology, which was accepted, and the case was settled by judgment being entered for the plaintiff for £25.

House Agent's Commission.—Debenham and Others v. Chambers.—Mr. Justice Grantham, sitting without a jury, recently heard this action to recover £400 on an agreement. The defendant had on March 25, 1892, made with the plaintiffs, Messrs. Debenham, Tewson, Farmer, and Co. and Messrs. Quinton and Son, who acted jointly, an agreement which provided that the plaintiffs were to have the right to sell or let on behalf of the defendant the premises, 121 and 122, Bishopsgate-street Within. In case they found a suitable purchaser or tenant, or in case the defendant decided to build himself, the plaintiffs were to be paid a commission of £400. Another clause provided that the defendant must make up his mind within three months either to sell or to build himself, and it was on this provision that the main question turned. The defendant had not within the three months in question either sold the property or begun to build. He began, however, to build in December, 1892. The plaintiff's contention was that the defendant by his agreement was bound either to sell through them or decide to build in three months' time, and that, therefore, they were entitled to recover the £400 for their trouble, although within the time named he had done neither. For the defendant it was argued that as the plaintiffs had not procured a suitable purchaser or lessee within the three months named in the agreement, and as the defendant had not built within that time, they were not entitled to recover the commission. Mr. Justice Grantham, in giving judgment, said that he had come to the conclusion that the plaintiffs were entitled to succeed. It was said that, because the defendant did determine to build within three months he was not liable; but he was compelled by his agreement to make up his mind within three months. That was part of the contract, and the defendant knew it. Judgment for the plaintiffs, with costs.

External or Party-Wall.—At Westminster Police-court, last week, Mr. De Rutzen, after some long arguments, gave his decision on an appeal, under Section 150 of the Building Act of 1894, against a notice of objection given by Mr. E. Dru-Drury, district surveyor, as to a wall in course of erection by the builder for the Army and Navy Auxiliary Stores, in respect of an extension of their premises in Coburg-row, Westminster. The question involved was as to whether the wall could be for some part of its height a "party wall," and as to the remainder "an external" wall. On the result the right of making certain openings depended. Mr. De Rutzen decided the case in favour of the appellants, the Auxiliary Stores. Mr. Seager Berry said that probably the County Council would appeal on a case stated. The magistrate had no wish to discourage an appeal, but as that would add to the expense he would allow the appellants 20 guineas costs.

CHIPS.

Colonel Coke, C.E., held an inquiry on Friday respecting an application made by the Colwyn Bay District Council to the Local Government Board to sanction a loan for the extension of the promenade and other public improvements in the district. Evidence was given by Mr. Jones, surveyor to the authority.

The new waterworks at Launceston were formally opened on Thursday in last week. The absolute necessity of improving the water supply of the town had long been recognised; but matters were practically at a deadlock when, three years ago, Mr. John Kittow was elected mayor. He suggested the bold idea of bringing in a supply from Carne Downs, in the parish of Altarnun, a distance of ten miles. The scheme was adopted, and has been carried out under the direction of Mr. Silvanus Jenkins, engineer and surveyor, of Liskeard, and completed in the third year of Mr. Kittow's mayoralty. The cost has been £10,500.

The subscription list to the memorial of the late Professor R. S. Poole will close on December 5 next. The memorial, which will take the form of a life-size bronze medallion in high relief, has been intrusted to Mr. George Frampton, A.R.A., and will, when finished, be placed in the British Museum—probably in the Medal Room.

Mr. W. H. Dunn, architect, whose year of office as Mayor of Gateshead has just expired, has been re-elected an alderman of that borough.

A new church is about to be built at Prenton Hill, near Tranmere, and will be dedicated to St. Stephen.

The district council of Hales Owen have adopted plans prepared by Mr. W. J. Fiddian, C.E., for the internal sewerage of the Lye and Wollescote districts, which are included in the Upper Stour Valley main sewerage scheme. The estimated cost to Lye will be £4,410, whilst Wollescote will be called upon to pay £2,970.

A new organ, which has been erected in St. Michael's Church, Langley, by Messrs. Nicholson and Co., Worcester, at a total cost of £600, was dedicated by the Lord Bishop of Worcester on Friday.

Municipal life in Wakefield is agitated by a proposal to extend the Ringstone waterworks by the construction of three additional reservoirs, at an estimated cost of about £120,000. When the whole are completed the city will have a waterworks scheme of a very efficient kind at a total cost of nearly £900,000.

The award in the arbitration between Mr. Peele, the owner of the Glynn Estate, and the Penmaenmawr Local Board, respecting the claim as riparian owner for water, have been received from Mr. Croas, of Manchester, the arbitrator, who has assessed the amount of £355.

Messrs. Jas. Shoolbred and Co. are rebuilding that portion of their premises which stands at the corner of Grafton-street and Tottenham Court-road, from the designs of Messrs. Hovenden and Barber. Messrs. Holland and Hannen are the contractors, and the floors are to be fireproof, on the Mark Fawcett system.

New Board schools have recently been completed at Melton, Suffolk, at the cost of between £1,400 and £1,500. Mr. E. F. Bisshopp, of Ipswich, was the architect, and Mr. E. Adams, of Woodbridge, the builder.

At a meeting of the guardians of the Darlington Union, on the 11th inst., it was decided to erect a new block of buildings in Crown-street, comprising board-room, waiting-room, and offices for the clerk and his assistants, relieving officer, and the surveyor to the rural sanitary authority. Mr. G. Gordon Hoskins, F.R.I.B.A., was appointed architect.

WATER SUPPLY AND SANITARY MATTERS.

Hatherleigh.—This Devonshire village has just been supplied with systems of drainage and water supply up to modern ideas and requirements. The old masonry sewers and unglazed earthenware tile drains have been superseded by glazed stoneware socketed pipe-sewers, jointed with cement. All the new sewers have been laid on even gradients and straight lines, with manholes or lampholes at every change of gradient and intersection. Automatic flushing tanks have been constructed at the head of the main sewers, and these are supplied with water from the roads, surface channels, and from the waterworks. The outfall is near the bottom of the town, on land which has been under-drained with subsoil earthenware pipes. Ventilation is provided for at the manhole covers. The water supply is derived from a spring on the west side of the town, and the water is pumped up 165ft. to a covered service reservoir at the top of the town. The reservoir is built in two compartments, and will contain two days' supply for the entire population. The pumps are in triplet, and worked by an oil-engine, and are capable of raising the entire supply in eight hours. Hydrants for extinguishing fires are placed throughout the town. The works of both drainage and water supply were designed and superintended in their execution by Messrs. E. Appleton and Son, M.Inst C.E., of Torquay. The general contractor was Mr. S. G. A. Petherick, of Hatherleigh. Mr. Knowles has acted as clerk of works.

The Gorton Sewage Works.—The engineers have been Messrs. Lomax and Lomax, of Manchester, and under their direction the work has been carried out by Mr. Daniel Eadie, of Stockport. There are two detritus tanks, with a capacity of 110,000 gallons, and three large precipitating tanks, with a combined capacity of 1,079,000 gallons. The sewage, on entering the works, passes into the two detritus tanks, having first received a dose of ferozone sufficient to effect a complete precipitation of the heavier suspended matter. From these it flows into three precipitation tanks, where the lighter suspended matter is deposited. The sewage, having been clarified, is conveyed to six polarite filter-beds of a superficial area of 2,663sq.yds. The whole scheme is designed to meet the requirements of a future prospective population, and it possesses a convenience, said to be unique, in that the tanks and filter-beds are able to deal not only with the sewage, but also with a ½in. of rainfall over the entire area built upon. It is intended in future to deal with the sludge deposited in tanks by means of filter presses; but this is not yet included in the scheme. The outfall works have cost £17,000, and the concentrating sewers have involved an expenditure of £8,000 more. Other important sewers are about to be carried out, and when completed the whole of the sewage from the township will be conveyed to the outfall purification works, and the pollution of the rivers, so far as Gorton is concerned, will be at an end.

There is now being carried out a series of operations for the restoration of the upper portions of the tower and lantern of the Cathedral Church of St. Nicholas, Newcastle-on-Tyne, at the cost of the city corporation. The architect, Mr. Leeson, has estimated the cost of the work at £1,765, and there has just been introduced into the tower a new clock, which, with new dials, will cost about £680, manufactured by Messrs. Potts and Son, of Leeds.

A new parish room and clergy vestry, which have been added to St. Michael's Church, Upper Orwell-street, Ipswich, were opened on Monday by the Bishop of Thetford. The buildings join up to the present church at the south-east end, and consist of a parish room 39ft. square, with scullery attached, and entrances with vestibules from Bond-street and Upper Orwell-street, and a clergy vestry with door from same into chancel. The style is a simple form of Queen Anne, and the cost has been about £1,200. Mr. E. F. Bisshopp, of Ipswich, was the architect, and Mr. William Grayston, of the same town, the builder.

A new board school at Saxmundham, East Suffolk, was opened on Tuesday week. It forms three sides of a quadrangle, and consists of three rooms, comprising a large hall, an infant school, and a classroom, 60ft., 40ft., and 30ft. respectively in length, with a uniform width of 22ft. The quadrangle itself constitutes a sheltered playground, the open side of which faces south. On the west and east are the entrances, with cloakrooms and lavatories attached. The building is carried out with red facing bricks, with semi-circular window-heads of red bricks, the gable windows being relieved with Bath stone keys. The roofs throughout are covered with Broseley tiles. The corridors and cloakrooms are paved with red Staffordshire tiles. The plaster of internal wall is protected by a wood dado 4ft. high. The architect is Mr. T. E. Key, of 5, Bloomsbury-square and Aldeburgh, and the contractor Mr. W. Ingram Smith, of Woodbridge.

STAINED GLASS.

Gray's Inn Chapel.—A window to commemorate the connection of Thomas à Beckett with Gray's Inn was unveiled in the Inn's chapel recently. It appears that, by an Order of Pension, May 16, in the 31st year of Henry VIII., "consideration being had of the King's command that all the images of Thomas à Becket, sometime Archbishop of Canterbury, in any windows, either of churches or chappells, should be obliterated," it was ordered that Edward Hall, then one of the Readers of this House, should take out a certain window in the chapel wherein the picture of the said Archbishop was painted, and place another instead thereof in memory of our Lord praying in the wilderness. The Becket Window occupies the lancet north of the sanctuary, and replaces this one of the Saviour in prayer. The design, which was exhibited in the Royal Academy in 1894, is from the studio of Mr. G. W. Ostrehan, of Campden-hill, W., and depicts St. Thomas as Primate, Legate, and Chancellor. Above the figure are the towers and exterior outlines in darker hues of Canterbury Cathedral, and below is the scene of his martyrdom, with figures of praying monks. The window contains the arms of the donor, Mr. H. C. Richards, M.P.

Oxford.—The chapel of Manchester College has just been enriched by the completion of a stained-glass window at the west end. There are two rows of figures, the upper one representing Jesus Christ in the centre, and upon His right Joseph and Mary, and on his left Mary Magdalene and St. Peter, the lower row of figures representing the Four Evangelists and St. Paul. Below the figure of Christ and above that of St. Paul are the words "Know ye not that ye are the temple of God" (1 Cor. iii. 16). The figures are richly coloured, and stand out upon a light diapered groundwork. The window has been executed by Mr. William Morris, the figures having been drawn by Sir Edward Burne-Jones. Mr. Morris has also in hand the stained glass for the series of three windows on the north side of the chapel, and four of the windows on the south side. Those on the north side (the subject of which are Sir Edward Burne-Jones's cartoons representing the Six Days of Creation) will be fixed in the course of the coming winter. Those on the south side will not be ready till some time later.

Mr. S. E. Halliday, the contractor for the new church which is being erected at Stretton, entertained about 80 workmen and tradespeople at dinner. Mr. Halliday presided, and was supported by the vicar. The work of erecting the church is proceeding satisfactorily.

The Manchester Corporation have purchased three pictures from their current autumn exhibition—viz., "Summer Eve," David Farquharson; "The Drinking Pool," Arnesby Brown; and "When the Tide is Out," James Aumonier, R.I. The total amount to be paid for these works is £500, and the committee have still about £3,000 in hand.

The Great Western Railway directors at their meeting last week approved a plan and voted the necessary expenditure for remodelling and enlarging the passenger and goods station at Millbay, Plymouth, and for improving the access to the docks. The carrying out of the works will involve an expenditure of over £70,000, and the engineer has received instructions to get out the necessary detail drawings and specifications with the view to the letting of the contracts for the works.

At Thirsk, on Saturday, an illuminated clock, erected on the former site of the Market Cross, in commemoration of the marriage of the Duke of York and the Princess May, was unveiled. The clock has been built by public subscription at a cost of £250. The tower is in the Gothic style, and is built of sandstone from Rainton and Thimbleby quarries, relieved with columns of red sandstone from Rainton. The base consists of two red concrete steps, and a stone seat going round the tower. There are also drinking fountains. There are four dials to the clock, each 3ft. in diameter, surmounted by gables with finials, and the whole terminated by a central pinnacle, the highest point being 37ft. from the ground. The clock has been made and fixed by Mr. R. Richardson, of Middlesbrough.

Mr. T. F. Dicksee, father of Mr. Frank Dicksee, R.A., and of Miss Margaret I. Dicksee, and himself an artist of some repute, died at his residence, 2, Fitzroy-square, last week, at the age of 75. Mr. Dicksee was an exhibitor at the Academy for many years, while his brother, Mr. John Dicksee, was also well known in the profession, and there are other members of the family also exhibitors. Shakespeare's heroines were among his favourite subjects, and many of these, "Ophelia," "Beatrice," &c., were painted by him. "Olivia and Viola in the Garden" attracted much attention in the Academy Exhibition of 1892, and was reproduced. His only contribution to the walls of the Academy this year was a portrait of Mrs. Sidney Dicksee.

STATUES, MEMORIALS, &c.

Irvine, N.B.—This burgh is shortly to have a bronze statue of Burns, which will be set up on a prominent site. The commission for the statue was intrusted to Mr. Pittendrigh Macgillivray, A.R.S.A., who has at his studio, Ravelston Elms, Murrayfield, Edinburgh, just finished the figure in clay. The figure, colossal in size, is represented standing firmly on the left foot. The right foot is drawn up, and rests on a higher plane. The attire is a costume of the period—cut-away coat with broad collar, vest with open front, and necktie, knee-breeches, hose, and shoes. A plaid is thrown over the right shoulder. On the pedestal there are to be bronze panels with scenes from the poet's works.

CHIPS.

A Local Government Board inquiry was opened on Tuesday into the application of the Bolton Corporation to borrow £75,000 for the purposes of their new sewerage scheme. The scheme is opposed by the Little Lever District Council, the Lancashire and Yorkshire Railway Company, and by others. The inquiry was adjourned.

At the Estate Auction Mart, Tokenhouse-yard, business was dull in tone last week, and a large proportion of the properties offered failed to secure a purchaser. The aggregate of sales was only £46,099.

In an action heard in the Brompton County Court on Friday, "Shaddick v. Kirk and Randall," under the Employers' Liability Act, the plaintiff claimed £250 damages for injuries sustained by him on May 28 last. Whilst in the defendants' employment at Whiteley's Stores, West Kensington, timbering a trench, some concrete gave way and fell on the plaintiff, severely injuring him. The defence was that there were flaws in the concrete which could not be seen. His Honour found for the plaintiff with £200 damages.

At Bishop's Wood Church, Staffs, two stained-glass windows, executed by Mr. W. G. Taylor, of Berners-street, W., in the west end, have been dedicated. The subjects are full-length figures of St. John and St. James.

Good progress continues to be made in the preparation of the Geological Survey Map of England and Wales, on the scale of four miles to an inch. Of the thirteen sheets of which this map consists, four have been published, while the eleventh, comprising the tract of country between Reading and the mouth of the Bristol Channel, will shortly be issued.

A Local Government inquiry was held at Bolton Town Hall on Friday respecting the application of the corporation for sanction to borrow £75,000 for sewage purposes. In 1894 the corporation was summoned by the Mersey and Irwell Joint Committee for rivers pollution, and a magistrates' order for the execution of suitable works within twelve months was made, and the corporation had to provide for a population of 140,000, including some out-districts. The corporation have purchased Rhodes Farm, containing 145 acres, and situate near Clifton Junction. Mr. H. L. Hinnell, civil engineer, said the new works were calculated to meet all requirements for 30 years.

The new institute at Trentham, provided by the Duke of Sutherland, was opened last week. The style of the buildings is Early English, and they are of one story throughout. The block comprises a lecture-hall, accommodating about 350 persons, a billiard-room, a room for the use of the mothers, a library, and a refreshment-room. The upper part of the walls is of cement, below which is a deep dado of varnished pitch-pine. The buildings are from plans of Mr. Roberts, the duke's architect, the building contracts having been carried out by Mr. P. H. Bennion, of Longton.

A niche in the south porch of the parish church of Crewkerne, which has long been empty, has just been filled with a statue of St. Bartholomew, the patron saint of the church. The statue is in Ham Hill stone, and is slightly under life size (measuring 5ft. high exactly). It shows a short-bearded, bareheaded, middle-aged man, with a cloak thrown over his under garments. In his right hand he holds a copy of St. Matthew's Gospel, and in the other a large butcher's knife, emblematic of his martyrdom. Messrs. Harry Hems and Sons, of Exeter, were the sculptors.

The Cliffe Wesleyan Chapel at York was reopened on Friday, after restoration and renovation, carried out by Messrs. Swain and Son, of Selby.

The great hall block of the Church House, now in course of erection from the designs of Sir Arthur W. Blomfield, A.R.A., will be completed by the end of this year, and the Upper and Lower Houses of the Convocation of the Province of Canterbury will hold their next group of sessions in the temporary rooms on the ground floor of the building, which have been fitted for their use. The Duke of York has consented to open the great hall on some day towards the end of January.

Our Office Table.

The Trades Technical Schools, carried on by the Worshipful Company of Carpenters and other City Guilds connected with the Building Industries, at 155, Great Titchfield-street, Oxford-street (the premises for many years occupied by the West London School of Art), were thrown open for public inspection last (Thursday) evening. A large number of architects, builders, and others interested in the work of the schools, were present, including Mr. F. C. Penrose, F.R.S., P.R.I.B.A., who gave a short address. All the classes were at work from 7.30 till 9.30 p.m., and great satisfaction was expressed at the practical character of the training given.

The Selection Committee of the Lancashire Standing Joint Committee received between 80 and 90 applications from practitioners in all parts of the kingdom in response to their advertisement for an architect for police buildings in the county under their administration. Eight gentlemen were selected from this list on account of their experience in this class of work, and were afforded personal interviews at Preston County Offices last week, when the following three were successful in receiving recommendations to the General Committee, and from which the final selection will be made:—Mr. Littler, of Manchester, whose firm, chiefly in his late father's, Mr. Henry Littler's, lifetime, carried out work for the county to the value of nearly half a million sterling; Mr. Denison, of Wakefield, who, in the county surveyor's office for the West Riding of Yorkshire, has gained long and thorough experience; and Mr. E. Howard Dawson, A.R.I.B.A., F.S.I., Assoc.San.Inst., of Lancaster, who was articled with the present county architect for Cumberland, and has carried out a good deal of work both for the Asylums Board and for the County Police Committee in the neighbourhood.

At a recent meeting of the Statutory Board of Examiners, Mr. Fowler, the well-known surveyor to the Portland Estate and district surveyor for Shoreditch, announced his resignation of the office of chairman, which he had held since 1884, his membership of the board dating from 1869. Professor T. Roger Smith was consequently requested to act as chairman, and Mr. Lacy W. Ridge as deputy-chairman during the remainder of the official year.

Attention has been called to a vaulted cell, some 13ft. square, which, after being used as a coal-cellar for many years, has been "discovered" in the basement of a house in Britton's-court, Whitefriars-street. The stone roof, which is in good condition, is formed with eight ribs meeting in a boss or rose in the centre. The work is of the 14th century, and presumably the vault was part of the Carmelite establishment, a trace of which remains in the name Whitefriars still given to the district where it stood. In the south-east corner there is a low archway, from which a curved passage, at present blocked by a brick wall, appears to lead. In the earth which covered the floor to a depth of 2ft. or 3ft., a good many things have been found, such as bones, buttons, bits of china, coins, and tobacco-pipes.

A 100-ton Buckton vertical testing machine, provided at a cost of £1,200, was formally added to the engineering department at the Bradford Technical College on Monday night, in the presence of Professor Kennedy, LL.D., F.R.S., president of the Institution of Mechanical Engineers, and a good company of local engineers, architects, and surveyors. The first part of the ceremony consisted of breaking a piece of Low Moor iron $3\frac{1}{2}$in. by $\frac{3}{4}$in., which was done by the machine at 64 tons. Professor Kennedy, in a subsequent address, informed the members and visitors that, despite statements made to the contrary, technical education in this country in 1895 was not behindhand; during the past few years it had made rapid advancement, and was now in a condition of which they need not be ashamed. Abroad, the education given was excellent, strongly organised, and consequently much more uniform and systematic than in this country. At home there was not such uniformity as abroad; but he was of opinion that we got better results out of our men. This country certainly was in the front with practical laboratory training for engineers and mechanical men generally. He congratulated the Bradford Technical College on the laboratory it possessed, and on its latest addition in the form of the testing machine. In engineering, every man should be able to measure for himself. If they put a piece of steel into the machine and drew it to the limit of its elasticity, say 15 tons, and then put it away for two or three years, they would find its elasticity had increased to 17 tons or so.

At Friday's meeting of the county council of Cumberland, it was decided, after a discussion and division, to consider the expediency of taking measures to improve the present bridle-path from Borrowdale to Wasdale Head by Styhead Pass, in order to make a road suitable for cart and carriage traffic, and that the matter be referred to the highways committee to report thereon. The chairman of the highways committee explained that the distance between Seathwaite and Wasdale Head was 3½ miles as the crow flies; but at present the only available road for conveyances from the one point to the other traversed a distance of 55 miles. The county surveyor had suggested a road, which, following the hill sides, would enable the journey to be accomplished by driving a distance of about seven miles. The gradients of the road would range from 1 in 12 to 1 in 20. All the parochial and district councils interested on both sides of the Pass, except Borrowdale, had sent in memorials in favour of the construction of the road.

In a recent communication to the American Society of Civil Engineers, Mr. E. Gerber gives the results of a careful investigation into the present state of a number of bridges which had been painted with one of several classes of paint. In all cases rust was found to a greater or less extent, occurring always in spots in the centre of clean metal. Most of this, however, was thin, and was as bad in new structures as in old. It was, however, found that the iron oxide paints adhere more firmly to the metal than the lead paints, only one case being found in which the latter adhered well and was tough. It is, however, suggested that much of this brittleness was due to the adulteration of the oil by turpentine, benzine, or other petroleum products. There is more likelihood of such adulteration with lead paints than with iron, as they are more difficult to spread, and there is thus more temptation to dilute the oil. In some cases bridges coated with iron oxide 11 or 12 years ago were still in good condition, without having been repainted. Only two of the bridges examined had been painted with carbon or asphaltum paints; but the condition of things in these two cases was found to be not altogeter satisfactory, as in neither case was the coating tough and adherent. The metal had, however, been protected by them. Mr. Gerber thinks that the best method of securing clean surfaces is to coat the metal with linseed oil as it leaves the rolls.

The Frascati Restaurant in Oxford-street, which since it came under the management of the present proprietor, has always been a favourite resort, has recently been entirely redecorated and thoroughly renovated. The original plastic decorations were elaborate, and afforded but little scope for embellishment beyond an accentuation of colour effect, the general scheme of which is ivory-white, cream, and cinnamon, the tints developing in their descent down to a strong reddish brown. Where gold has been used it has been applied *en bloc* instead of the usual "gilding" method. The redecoration of the dome is a triumph in its way, and by a new and ingenious process all the ornamental work in relief has been enamelled so as to facilitate cleaning. The opportunity has also been taken to improve the ventilation of the building. The whole of the work has been carried out by the well-known firm of Messrs. Campbell, Smith, and Co., Newman-street, who have in hand at present, among other works, the decoration of the extension of the Tivoli, Strand.

Electric street railways or tramways have been greatly developed at Boston in the States. Within a radius of 10 miles from the Massachusetts State House are "26 beautiful residential cities," practically the suburbs of Boston, and these developments are said to be due to the transit facilities. Of the construction of these lines the *Building and Engineering Journal* gives some details. "On the short radius curves, grooved rails are used on both inside and outside rails, while if the radius is 150ft. the inside rails only are grooved, and if the radius is 350ft. guard rails are dispensed with. Both underground and overhead systems are employed; for overhead lines the poles are placed about 125ft. apart, and consist of metal tubing or yellow pine, square in section and set in concrete to a depth of 6ft. 6in. The trolley wire is 18ft. above the track, and is of hard drawn copper, and the guard wire of galvanised iron." The West End Company has four power stations, 26 engines, and 80 dynamos, and has 1,704 electric cars and 23 car-houses. A subway is proposed by the city for the purpose of removing the tracks and cars from the street. This subway is to have four tracks, 14ft. from top of rail to roof, and the total width 48ft., divided in the centre by steel columns supporting the roof.

The Tarrant Building, New York City, which had to be constructed to resist large and irregular loads, has been constructed, according to the description given by the architect, Mr. H. R. Marshall, so that the walls are entirely independent of the floors, which latter are carried on a system of cast-iron posts and pine girders. To avoid imperfections in the columns due to irregular contraction round the brackets holding the girders, the architect has used a system of annular corbel brackets of large size, which slide over the columns after the latter are fixed. The brackets rest on annular lugs cast on the columns, and are made of unusual strength and size, thus reducing the bearing of the girders, which are of hard pine. The wall columns are anchored to the walls by bar anchors, which play in slotted lugs cast on the columns. Other details of the building show that the architect has met the requirements of the case, and since its construction it has shown no settlement, although great variations of weight and temperature have been experienced.

CHIPS.

At the South-Western Police-court on Wednesday, Mr. James Rose, of Summer's Town, Wandsworth, was summoned by the Wandsworth District Board for failing to supply water to occupied houses. It was stated that the non-supply had lasted for thirteen weeks, and that the Southwark and Vauxhall Water Company had dug a deep well which drained the one which had supplied the houses. The magistrate observed that the defendant was not in fault, and that there was no remedy against the company, and the summonses were withdrawn.

At the invitation of Mr. Newbery and the committee of the Glasgow School of Art, a *conversazione*, attended by a large number of students and friends, took place in the Fine Art Institute Galleries, Sauchiehall-street, on Friday evening. A programme of musical selections was gone through during the two hours' proceedings.

The Duke of Norfolk has just given to Arundel a post office, which he has erected at a cost of £7,000. The interior is entirely fitted with fine British oak from the ducal estate, the public portion of the building being tastefully lined with glazed tiles.

At the monthly meeting of the Yeadon Urban Council, out of fifty-five applicants, Mr. Clifton Lund, of Walton-on-Hill, near Liverpool, was appointed surveyor and nuisance inspector, in place of the late Mr. Isaac Wood, at a salary of £90 per annum.

St. Peter's College, Peterborough, is being enlarged by an addition at the rear, at a cost of £1,200. The work is being carried out in red Leicestershire brick to match the present, and the contractor is Mr. Bridgefoot. The extension will provide on the first floor a common room 32ft. by 19ft., with a smaller one 20ft. by 19ft., and on the second floor there will be a lecture room 32ft. long, and chemical laboratory 20ft. long.

At Corsham, on Friday, Lord Edmund Fitzmaurice opened the first board school which has been erected in that parish. The building is near the main road leading from the railway station to the town. It is built of local hardstone, with Bath stone dressings. Wood block floors are provided, while the walls throughout have glazed brick dados. It was built according to the plans of Mr. Harold Brakspear; the contract was taken at £3,075.

The Brighton Town Council has resolved to purchase the undertaking of the Shoreham and District Waterworks Company for £56,700, and, to carry this out, to promote a Bill in Parliament.

The Museum of Comparative Sculpture at the Trocadéro has just obtained an important addition in the shape of a cast of the group representing the "Descent from the Cross," the masterpiece of Ligier Richier, in the Abbey Church of St. Michel. The library of the museum has lately received a series, 10,000 in number, of photographs from foreign monuments of art, obtained in exchange, and supplementing the collection of such records which was begun by Viollet-le-Duc.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institution of British Architects. "The Sculptured Columns of the Temple of Diana at Ephesus," by Alexander S. Murray. 8 p.m.

Tuesday.—Society of Architects. Address by the President, E. J. Hamilton. 8 p.m.

Institution of Civil Engineers. "The City and South London Railway," by J. H. Greathead. 8 p m.

Glasgow Architectural Association. Lecture by Percy Fitzgerald, M.A., F.S.A., of London.

Wednesday.—Carpenters' Hall Lecture. "Sanitary Appliances," by Professor A. Wynter Blyth. 8 p.m.

Society of Arts. Opening Address, by Major-General Sir John Donnelly, K.C.B., Chairman of the Council. 8 p.m.

Northern Architectural Association. "Mediæval Mouldings: Features and Ornament," by C. S. Errington, A.R.I.B.A. 7.30 p.m.

Friday.—Architectural Association. "The Municipal Control of Buildings," by Dr. G. B. Longstaff, L.C.C. 7.30 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

The FIRST ORDINARY MEETING of the Society of Architects for the Session 1895-96 will be held at the Rooms of the Society, at St. James' Hall, Piccadilly, W., on TUESDAY, November 19th, at Eight o'clock p.m., when the PRESIDENTIAL ADDRESS will be delivered by Mr. EDWIN J. HAMILTON.

ELLIS MARSLAND, Hon. Sec.

A new church vestry, oak choir-stalls, and marble and tile pavements and marble steps, have just been completed at St. Matthew's parish church, Ipswich. The cost has been between £600 and £700. Mr. E. F. Bisshopp was the architect, Mr. F. Bennett the builder, and the carvers Messrs. John Groom and Son, all of Ipswich.

New Roman Catholic schools have just been completed at Silvertown, E., from designs by Mr. J. H. Eastwood, of Gilston-road, S.W.

The urban district council of Tonbridge have referred back to a committee the proposal to offer 40, 20, and 10 guineas respectively for proposed free library buildings, intended to be built in High-street and Lyons-crescent, at an estimated cost of £4,500.

The foundation-stone of the new church at Carlton Miniott, near Thirsk, was laid on Saturday by the Dean of York. It is to occupy the site of the ancient parish church, which for many years has been in a state of decay. The architect is Mr. C. Hodgson Fowler, F.S.A., of Durham, and the contractor Mr. Harwood, of Marfield. The cost of rebuilding and furnishing is estimated at £1,200.

The dedication service took place on Friday of the new hall, which forms part of the scheme for providing a Presbyterian church in the rapidly-extending village of Whitley. The portion now dedicated has been erected by Mr. Thomas Robson, of Tynemouth, from the designs and under the supervision of Mr. Henry Gibson, of North Shields.

The Great Western Railway Company have just commenced improvements at the railway station at Devizes, including the erection of a new signal-cabin to work the up and down lines, in place of two existing small ones; and three new sidings for goods traffic, to accommodate 50 additional trucks. The work will cost £4,000, and between 80 and 90 men are employed.

It is proposed to drive a tunnel from the Delabole quarries to the sea-cliff, in order to get rid of the "addle" by the easy method of dumping it into the sea. The quarries are 300ft. deep, and the tunnel will be about a mile and a half in length; but it is believed that there will be sufficient slate obtained in making the tunnel to cover the cost, about £30,000, most of which would be expended in labour. The refuse is at present brought to the surface—rather an expensive process, and one that does not conduce to economical working.

A new board school in Princess-road, Moss Side, Manchester, was formally opened on Friday by the Marquis of Lorne, M.P. The school building has been designed on the central hall principle, the school hall being in the middle and the entrances and offices at the sides. The building is of three stories. On the ground floors are six infants' class-rooms. The central hall is on the first floor, and at each end of the hall there is a range of four class-rooms. The second floor is the playground for boys. On this floor are chemical laboratory and a lecture-room, with gallery. A room for instruction in manual work and a cookery room have also been provided. In all, places are provided for 1,226 children. The left wing of the building includes offices for the board on the ground floor, and in the right wing is a caretaker's house. The cost of the whole school and the board offices and caretaker's house has been about £14,000.

LAVERS and WESTLAKE.
PAINTED GLASS WINDOWS.
MONUMENTAL BRASSES.
MURAL DECORATION.
ENDELL STREET, BLOOMSBURY, LONDON, W.C.

FAMBRINI & DANIELS,
MANUFACTURERS OF IMPERISHABLE CONCRETE MASONRY FOR

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

ASHFORD, EAST KENT.—For furnishing the new board schools:—

	£	s.	d.
Bennett Furnishing Co. (accepted)	£139	0	0

BECKENHAM.—For building a new kitchen and for drainage works at the George Inn, Beckenham, Kent. Mr. Robert M. Chart, F.S.I., Union Bank Chambers, Croydon, architect and surveyor:—

	Contract No. 1.	Contract No. 2.	Total.
Waller, D., Jun., Croydon	£195 0 0	£79 10 0	£274 10 0
Goulder, E., Croydon	182 0 0	69 0 0	251 0 0
Howard, T. G., Mitcham	149 15 0	75 5 0	225 0 0

EASTLEIGH, HANTS.—For the erection of a new Baptist church. Messrs. Lawson and Donkin, Yelverton Chambers, Bournemouth, architects and surveyors. Quantities by the architects:—

	Chapel.	School.	Total.
Pearcy, W., Poole	£889 19 0	£230 0 0	£1,120 8 0
Treherne, Eastleigh	863 6 11	239 1 11	1,102 8 10
Chinchen, W. J., Bournemouth	895 0 0	195 0 0	1,090 0 0
Burt and Vick, Poole	861 0 0	199 10 0	1,060 10 0
Elcock, F., Pokesdown	825 0 0	322 0 0	1,047 0 0
Wickham, Eastleigh	822 0 0	215 0 0	1,037 0 0
Hunt, C., Winton	791 18 10	189 12 2	981 11 0
Rowland, Southampton (accepted)	711 0 0	185 0 0	896 0 0

BURSLEM.—For lighting the public baths by electricity, for the town council:—

	£	s.	d.
Crompton and Co. (accepted)	£215	0	0

CARSHALTON.—For the erection of a billiard-room at Hill House, Carshalton, Surrey, for Captain Thomas Goodson, J.P. Mr. Robert M. Chart, F.S.I., Union Bank Chambers, Croydon, and Mitcham, Surrey, architect:—

	£	s.	d.
Stewart, D., Wallington	£485	0	0
Waller, D., Jun., Croydon	450	0	0
Burges, J., Wimbledon	370	0	0
Burnaud, E. J., Wallington*	353	0	0

* Accepted.

GOSPORT.—For the erection of a villa at Alverstoke, Gosport, for Mr. W. E. Churcher. Mr. Harry A. F. Smith, M.S.A., Star Chambers, High-street, Gosport, architect:—

	£	s.	d.
Light, W. R., and Son	£2,940	0	0
Hill, W., and Co.	2,931	0	0
Croad, J.	2,927	0	0
Dash, C. M.	2,901	0	0
Ward, W., and Son	2,789	0	0
Lear, C. J., and Son (accepted)	2,787	15	0

HAMPSTEAD MARSHALL, BERKS.—For taking down and rebuilding the schools, for the Trustees. Mr. James H. Money, The Broadway, Newbury, architect:—

	£	s.	d.
James, E. C., Newbury	£429	0	0
Elmo, G., Benham	330	0	0
Brown, G., Devizes	328	0	0
Pope and Co., East Woodhay*	313	0	0

* Accepted.

HASSOCKS.—For the erection of a detached villa, Stanford-avenue, Hassocks, for Mr. W. G. Robinson. Mr. Clayton Botham, 42, Ship-street, Brighton, architect and surveyor:—

	£	s.	d.
Saunders and Sons, Brighton	£2,066	0	0
Oram, Burgess Hill	1,987	0	0
Norman and Burt, Burgess Hill	1,942	0	0
Taylor and Kensett, London	1,820	16	6
Box and Turner, Ardingly	1,775	0	0
Downer, Burgess Hill	1,450	0	0
Hollands, Hurstpierpoint*	1,429	0	0

* Accepted.

IPSWICH.—For alterations to the lavatory of the Grand Jury room at the Shire Hall, St. Helen's, Ipswich, for the Suffolk County Council. Mr. Miller, county surveyor:—

	£	s.	d.
Parkington and Son	£72	10	0
Stearn, A., and Son	67	12	6
Crisp and Smith	64	18	6
Kenny, G. A.	64	14	0
Bird, B., Jun. (accepted)	64	10	0

All of Ipswich.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2133.
FRIDAY, NOVEMBER 22, 1895.

THE END OF IRON ARCHITECTURE.

IRON, in one or other of its forms, was never used so much in building as it is to-day, and yet was never treated with so little regard to its architectural capabilities. To a large extent this is its own fault. In other words, it results from inherent vices in the material, which, in the present state of our knowledge, have to be dealt with in ways which keep it pretty much out of sight. Five-and-twenty years ago sanguine young architects were thinking of devising an "iron style." Metal had been admitted into building, but, save on the smallest scale, not into art, and how to transform it and make it a worthy rival of wood and stone seemed the pressing problem of the future. Nobody gives his mind to the subject now. Iron construction is more and more in vogue; but iron architecture, till science shows us how to modify the nature of iron, is given up as hopeless.

And yet a real advance was made in that bygone period. Something was actually effected here and there towards natural and graceful design, even in cast metal. The ironfounder, and the class of architects—if so they could be called—who chiefly employed him, began by copying masonry details. Their idea of an iron capital, for instance, was an attenuated Corinthian or Composite one, in which a lot of detached leaves were screwed to or stuck against a shapeless "bell." It is said that even now, in the dark places of the earth, such abominations are set up by the "building negotiant" or surveyor-of-all-work. But in the last generation even men of taste and culture found it difficult to get anything better. They began, however, by dropping the deciduous foliage, which, to tell the truth, had a tendency of its own to drop when it was least expected. They resolved that their capitals and similar details should at least be real and lasting, and this was the first advance. Then it became clearer and clearer to them that the whole set of forms which had been transferred from stone to iron were very unsuitable to the latter. As regards undercut mouldings, this had always been obvious. The founder was ready enough to say how much trouble they gave him; how they made him divide his mould into many pieces, as the only way of drawing out the pattern; and how he would infinitely rather cast them separately, like his acanthus leaves, and pin them on. Where this was not agreed to, he tried, naturally enough, to reduce the hollows, and so to shape them that the pattern would "draw out." But mouldings, whether Classic or Gothic, with their deepest shadows thus done away with, are no longer worth retaining. Moreover, their finer lines and edges were a failure, and in the end the thoughtful designer of cast work gave them up, and originated types suited to the stuff he was dealing with. No sharp lines, no deep sinkings, no great inequalities in thickness, to produce flaws in cooling; these were the conditions he had to fulfil. And in proportion as he fulfilled them, he found himself coming nearer and nearer to the work of the old Sussex and Hampshire founders of two or three centuries ago, who lived when arts and crafts had not quite ceased to be, and who shaped their detail to suit their hands as well as their heads.

An architect of genius—who died, it is true, while his genius was unripe, but whose failures were more suggestive than many men's successes—did something in iron architecture which is still interesting. Mr. Woodward's experiments at the Oxford University Museum were mainly in the right direction, severely as they were criticised by his contemporaries who never ventured off the beaten track. "Whatever brought you here, Mr. H.?" said a patronising visitor to an eminent writer who had been placed for a few weeks in a private asylum. "What will never bring you here, sir," said the supposed lunatic; "too much brain." It was just this that made Woodward to differ from his critics. They would never have had imagination enough, or force enough, to go wrong where he went wrong, much less to invent what he invented that was good and right. On the whole, these terms may fairly be applied to his ironwork. It was only a first attempt at true modes of working. It was a mere hint of what he might have done in that line with years and experience, but it was better than what any architect had done before him. It shows that he realised the nature of cast iron, and was learning to model it almost as a sculptor models clay. He had buried his masonry formulas; he made his capitals no longer round on plan, or square or octagonal; his very curves were not circular; he threw out a plate here and a flange there, just where construction required it; and he bounded and joined them all by the smooth, flowing lines which make casting simple and easy. Perhaps he was less successful in applying wrought-iron decoration to his cast work. He did not quite blend the two things into one whole. But the applied leaves were avowedly applied. They were no sham, like the founder's cast acanthus leaves; and even if they were quite removed, they would leave a groundwork behind which was beautiful and characteristic.

When things got as far as this, how was it that they got no farther? It was not that no other architects saw the suggestiveness of Woodward's work. It was not even that they had all abjured modernism, and were resolved simply to repeat what had been repeated a thousand times in bygone ages. This, perhaps, had something to do with it; but it was not the full explanation. The real reason was, that about this time cast iron was "found out." Cast-iron girders—which had long been in fashion amongst builders for carrying great masses of brickwork over shop-fronts and similar openings—cracked in many cases without visible cause, and fell. "A flaw in the casting" was the explanation at the inquests, and this made people look about for some material whose flaws did not fail quite so suddenly. Then cast-iron columns, too, which had been vaunted as fireproof by persons who thought that whatever would not burn was indisputably proof against fire, were found to collapse with very little heat indeed. The destruction of the Surrey Music Hall was an object-lesson to Londoners about the effect of fire on cast iron, and dozens of similar cases carried the same teaching to other parts of the kingdom. By degrees it was realised that cast iron is not safe anywhere against cross strain, and that though at common temperatures it is strong enough against vertical pressure, it will hardly bear its own weight when red-hot. For girders, this was the end of it. Rolled-iron joists came in; and came, as many of us thought, to stay. Steel may be now superseding them; but it is not quite certain yet that steel is as safe as it is strong. In the matter of rails, the St. Neot's railway accident suggests that it is not. But, in any case, cast iron has taken a long farewell of us as regards girders. In columns its virtues keep it in use; but its weakness when exposed to fire puts it, or ought to put it, out of sight. In buildings it is only safe when thoroughly embedded in concrete or something similar. There is no more question, therefore, of architecturally treating its shafts or its capitals or its bases. The only concern now is to make them strong enough, and to shape them so that they can be effectually covered up. That is the end of attempts at developing an iron architecture.

On a smaller scale, of course, iron is largely used, and is seen as iron. And even on the very largest scale there are cases—as, for instance, in bridges—where protection from fire is unnecessary. So much, then, is left, out of what looked, a generation back, like a practically unlimited field for design. But here another weakness of iron comes out, and a weakness which affects wrought metal even more than cast. This is its tendency to rust. It acts in two ways, at least. It makes the life of iron structures short. More than 20 years ago rust by tons weight was scraped off the Menai Tubular Bridge, which was only built about 1856. We published last week a note by an American engineer on the present state of various other railway bridges of recent date; and the sum of it was, that no class of paint affords real protection. "We may not live to see the day"; but for another generation there is a bad time coming, as regards its iron bridges. If railways are superseded before then—whether by flying machines, petroleum motors, or anything else—all may be well; but if not, there is a prospect of incessant accidents, and intolerable outlay in repairs. As regards small details in iron, the case is not so serious. It is simply that there is no satisfactory way of preserving them when they are used externally. The common thing, of course, is to paint them; but this has frequently to be re-done, and the end of it is that all the delicate work, whether in wrought iron or cast, is practically obliterated. Oxidation, moreover, goes on below the paint, especially at points where moisture is apt to collect, or where some galvanic action is set up. To see how nearly, in about a century and a half, this can destroy even unusually solid castings, it is only necessary to look at the railings of St. Paul's Churchyard, especially on the north side. Many of them are almost eaten away on the lower part. Thinner railings, and especially wrought ones, perish in a fraction of the time, so that the architect who means his work to last has little inducement to make a great external feature of his ironwork. This, of course, has always been so, We have lost, in consequence, most of what the Mediæval workmen did, unless it was either used internally or was much sheltered, as door-hinges are. But we had hopes, a quarter of a century ago, that this congenital weakness of iron might be overcome. The Barff process promised to cover the metal with a durable rustless surface, and, more than that, with a truly metallic one. It was simple and ingenious. The work to be protected was raised to a high temperature, and kept for some hours in superheated steam. The effect of this was to convert the face, not into ordinary rust, but into magnetic oxide, firmly attached to the objects which it covered. This oxide differs little from iron in appearance, and it is unaffected by air, water, and weak acids. The problem of protection seemed, therefore, to be solved; and there was apparently no reason, thenceforth, why the smith's work should not last as long as the mason's or the carpenter's. Unfortunately, for the light decorative features as to which this promised most, it has not proved as successful as could have been wished. A slight bend, such as may easily happen in fixing, or in daily use, will imperceptibly crack the film. No damage appears at the time; but damp enters there, rust begins, and quickly spreads. The same thing happens—as one can see at almost any railway station—with enamels on iron, which, if they had proved really permanent, might by this time have been made agreeable, and even beautiful.

The sum of the whole matter is, that we are never likely to have an iron architecture

—a mode of building, that is, in which the properties of that metal are brought out and turned to artistic uses. We may have iron construction hidden away under plaster and concrete. We may have smaller iron details, as all ages have had. We may have them for a thousand purposes, and we may have them, and ought to have them, of incomparably better design than we now do. Such work as Woodward's need not be uninstructive to us, though we do not apply it, as he did, to columns, and other great structural features. The principles on which he worked—the principles on which the old South-country founders worked—are the very principles which need applying to our hideous stoves, and grates, and ranges, and all the other abominations of the modern pattern-book. If the iron-caster would only design, or train somebody to design for him, castings suited to his processes and to the nature of the stuff he works in, it would be better for himself, and for all of us. He gives himself a world of trouble in trying to imitate everything that he should not—wrought-iron detail, stone detail, wood detail; and the more he labours and takes pains, the more he is left behind. The least repulsive things he does are those which he never intends to be seen: his castings for purely mechanical purposes, in which he shows his practical knowledge instead of his artistic ignorance. If he could but content himself with being natural, and not aim at being fine, how respectable, in comparison, he might become! The smith, on the contrary, has kept up, or revived, the old traditions of his craft. He can still do good work when he gets the chance. Some day, perhaps, the chemist—who, as he well knows, has an infinity yet to learn about the constitution of iron and its alloys—will hit on an alloy which is malleable and rustless, and then the smith may have such opportunities as he has never had before. His work will then be as welcome out-of-doors as it now is within.

COARSE AND REFINED ARCHITECTURE.

"NOTHING," says Goethe, "is more significant of men's character than what they find laughable," and George Eliot, in one of her essays, commenting on this passage, observes that the word "culture" would be more appropriate than the word "character," and she very truly remarks, the last thing on which the cultured man can have community with the vulgar is their jocularity. We may easily paraphrase this remark by saying the last thing in which the artist can agree with the uncultured person or the man in the street is his sense of what pleases him. As the vulgar person may see something to excite his risibility, which would in no degree amuse the refined nature, so in like manner we find that qualities and attributes of architecture, painting, or music, which captivate the ordinary man or woman, are often repugnant to those who have studied these arts. In the two latter arts the truth of this proposition is incontestable, and we have ample proof of it every day in the lack of appreciation and sympathy shown by ordinary people to good music and pictures. They are positively deaf to those subtle melodies and gradations of sound which delight the cultured amateur in music, and blind to those refinements of drawing and colour which charm the connoisseur of painting. But in architecture, perhaps the most abstract of the three, the appeal to the popular mind is not so obvious; there is a general idea that a fine building appeals to all grades of minds alike. In a certain sense, no doubt, it does: its size, and imposing symmetry, and ornamental adjuncts are qualities which appeal to all, and delight the imagination; but there are other qualities of a more abstract and subtle character which the average minds do not appreciate, and which, so to speak, elude their mental analysis. Every architect must have had ample evidence of this in occasional remarks made on his designs and buildings by people who have no taste in such matters. The competitor knows, too well and painfully, the sort of criticism his design undergoes during its public exhibition — he especially who, oblivious of popular taste, has attempted the problem from a different side; or he who, with the study and fervour of a true artist, has rejected all clap-trap and trickiness of drawing by adopting a plain but artistic exterior. Those who have ventured out of the beaten tracks of Classic and Gothic, and who have adopted the more vernacular and unambitious models of 17th or 18th century architecture, know how very little understood or appreciated their work is, and what small chance there is for designs of this class, when they have to compete with others in more popular styles. Building committees, and even assessors are sometimes led away by certain salient and attractive features, which in themselves have no real merit, but which rather increase the cost of the building. Indeed it is well-known that this sort of attractive clap-trap has been the bane of competition in the past, and even still the resources of the architectural property shop are often more influential than the ablest designs. All this is very disheartening to men who have become masters of "style" in architecture in the highest sense, and not mere copyists and dabblers in it. There are certain "properties" of architecture which the competitor who wishes to win takes care to place before his patrons. He knows quite well what are the features and qualities which most please the uncultured mind. These we may be summarised under three general heads of (1) scale or magnitude, (2) elaboration or ornament, (3) captivating features, and they are equivalent to those popular qualities of melody in music which please the ear, and those who like realistic scenes, execution, and colour in painting. A large building is imposing to the popular mind;—the ordinary man is more interested to know the height of a building or its length, than whether such height or dimension is really necessary. The height of a tower or spire is a question which concerns the boy in the street a great deal more than its outline or proportion. As to ornament, we know that its quantity rather than its quality is esteemed by the public; it does not matter to the ordinary passer-by whether the frieze or band of ornament round a building is cast in cement or sculptured in stone; whether he sees a piece of cast ironwork from a trade catalogue, or designed expressly for the work. Again, redundancy and complexity of parts is taken by such people as "artistic." A front overcrowded with details or carving is admired more than one of simplicity and good detail; even such a thing as a turned newel, or baluster, or table-leg is esteemed rather for the complexity and number of its mouldings than for the artistic combination of plain and moulded parts. With such people true ornament is unknown and unappreciated. We have referred to certain other salient and attractive features which captivate persons who have little knowledge of, or taste for, art. These features are like the catch-phrases which seem to have such a sway over people of a certain calibre of mind. The dome is one of these features: it exercises a kind of potent charm over the popular mind; no building is thought fine without one. The same may be said of the portico. People who admire the Royal Exchange, St. Peter's at Rome, St. Paul's Cathedral, the British Museum, the Capitol at Washington, can see nothing to admire in buildings like the Law Courts, the Bank of England, and other edifices devoid of such features. Even a commonplace vestry-hall with a dome or angle turrets to recommend it is regarded with more esteem than a well and appropriately designed elevation. It is astonishing what a few turrets or columns will do. The most refined "astylar" façade or Neo-Grec composition is dull and uninteresting to a person who has no æsthetic sense; but so a classical piece of music or a learned discourse falls dull on the ears of the average auditor. Symmetry and balance are other qualities which excite pleasure; but to the architect they are only agreeable when they become the true expression of plan. Thus we may go on enumerating other features and qualities which, while they are attractive to the average person, have no meaning or artistic value to the architect. To the keen and sensitive artist they are in fact fulsome and vulgar.

The bearing of these remarks on competition is obvious. Designs in which the accompaniments we have drawn attention to are conspicuous never fail to become the favourites, while those in which real art and refined details appear are at a discount. But the real artist has to possess his soul in patience, and be content to draw a blank so far as competition prizes go. The appointment of an assessor is a guarantee —or ought to be a guarantee—that the mere clap-trap elements of design are set aside, and the real merits of plan and elevation judged. We cannot always expect even an assessor to exercise good taste in these matters—in fact, in a few instances he has been led away by the same allurements of style; but it may be generally affirmed that his advice, even if not always taken, as at Durham, has a beneficial influence over the committee. We have now much less of these blandishments of style; better taste in architecture and art education have rendered it almost impossible for any enlightened body of committee-men to accept replicas of noted buildings. We have seen the same wave of enlightened taste, or art culture, passing over the United States and the Colonies, transforming the vulgar and bizarre taste for churches and state houses prevalent a few years ago, in which the Five Orders and the Batty-Langley style were conspicuous.

Comparing many of the recent public and private buildings, the city halls, banks, insurance buildings of New York City, Chicago, Philadelphia, of Sydney, and Melbourne, with those erected a decade or two ago, we must acknowledge a refinement in style due to the trans-Atlantic intercourse, and the influence of European art. Yet the public taste remains far behind.

In furniture and decoration the popular and bizarre elements continue to linger in a more objectionable form than they do in architecture. This is owing mainly to the less direct influence of the artist between the manufacturer and the purchaser. In selecting chairs, and tables, and cabinets, as in chosing wall-papers, and carpets, and curtains, everyone thinks himself a judge; the maker simply caters to meet the largest demand and the public taste, however vicious it may be. Modern "art furniture decoration," as it is euphemistically called, is the merest veneer or pretence of what is considered good art, and people buy it because it is fanciful and pretty and fills up a room more decoratively, than the plain well-thought-out furniture which is designed by Mr. Norman Shaw, Mr. H. Baillie Scott, Mr. R. W. Edis, and other architects and craftsmen. At one time, cusped arches, stop-chamfers, and notches went down. Now it is the over-wrought and turned piece of furniture or overmantel, made after the manner of Jacobean, Chippendale, or so-called Renaissance. Even now the turned spindle and fretwork style find customers among many, and the exuberant curves of the late Louis Seize are preferred to the more sensible forms. Plain surfaces and refined mouldings are not showy enough for the ordinary buyer or the denizens of Curtain-road. Popular tastes die hard! Though we do not see such vulgarities in wall-papers as we did forty years ago, we still find people preferring the "loud" forms and colours in their crudest form as decorative motives. If the design is fairly good, it is the most pronounced colours or contrasts that are chosen. Gradation and delicacy, whether in form, or contour, or sound, are two attributes which one can hardly expect the uncultivated to understand. The choice and right use of mouldings, for instance, is one of the most certain tests of the architect's education; where to place ornament is another; but all the reading and drawing in the world will never teach how to do these things without an instinctive sense of the principle of gradation as controlled by judgment. To take such a common thing as a turned baluster: the simplest dictate of reason would place the boldest and plainest mouldings at the bottom; but how often we find the reverse followed, as if the members were crushed by the plainer ones above. Again, all curved members, or profiles, or ornament should be separated by plain surfaces—a rule equally ignored. But these things are subtleties to the ordinary designer, and he can no more discern them or appreciate them than the average man can discern the varieties of musical time and forms of movement in a work by Beethoven, or the subtle harmonies of tone in a landscape by Turner.

GIVING CERTIFICATES.

VERY easy and perfunctory as the duty is of giving a certificate, the architect is inclined to attach less importance to it than the requirements of the law demand. It is easy to sit down and fill up a printed form of certificate, as published for the use of architects, when the contractor applies for one, without considering the obligation imposed upon the architect. Building contract certificates are of several kinds, according to legal textbooks, though, as a matter of fact, they all come under two principal heads—Progress Certificates and Final Certificates. The former may be called intermediate certificates, given for the benefit of the contractor, to enable him to obtain payment on account during the progress of the work. When an architect gives a progress certificate, he does not mean it to be taken as conclusive as to the final amount, nor in any way to be taken as conclusive in a claim for damages. Lord Cairns laid down the rule that such a certificate must be taken simply as "a statement of a matter of fact—namely, what was the weight, and what was the contract price of the materials actually delivered from time to time upon the ground, and the payments made under these certificates were altogether provisional and subject to adjustment or to readjustment at the end of the contract"; or, as Pollock, C.B., has said: "Progress certificates are to be treated as sums paid on account of whatever the plaintiff might eventually be entitled to recover from the defendants, whether for original or additional work." It is in this sense that an architect gives a progress certificate; his principal obligation and duty is to ascertain by examination or measurement of the materials or workmanship supplied or used in the building, whether there is sufficient to justify his client to make an advance. It has nothing to do with "extras" ordered or sanctioned which are made in a separate bill; nor is it an exact account of the materials or items in the building. Now, we know a great many contractors who would make a claim for the extras to be added to a certificate of this kind. They have done extra work, and think they ought to have the amount included as the work proceeds in the same certificate. The architect sometimes yields to the request. There may be exceptional instances where the builder is unable to meet his expenses unless these additions are paid for as the work proceeds; but it is more correct to make a separate account of them. It is the safer and better plan to adhere to the system which has been confirmed by the Courts: that an intermediate or progress certificate is simply to show that the client is quite safe in making a payment by way of advance. Lord Hatherley, in "Thars's Sulphur and Copper Company v. McElroy," said clearly on this point:—"It is not an exact sum made up by calculation of items, and by applying the prices to the quantities of articles supplied. It is really nothing but this: it is an account sent in to show that the company are quite safe in making such payment as they may think proper by way of advance, because there is now upon their ground property of such a value." The ordinary builder of small means can make what agreement he likes, with the consent of the other contracting party; but if he signs the ordinary form of contract, he cannot expect any certificate he obtains to include within a certain percentage a payment for all materials and work he has supplied and executed. The recently-published Institute Schedule states that the contractor is to be entitled to payment; when in the architect's opinion work to a certain value has been executed in accordance with contract, "at a certain rate per cent. of the value of work so executed until the balance retained in hand amounts to £——, after which the instalments shall be up to the full value of the work subsequently executed." "When the work is practically completed he is to be entitled to receive £——, part of the said sum of £——, under the architect's certificate, and payment of balance within a period of —— months, or as soon after the expiration of —— months as the works shall have been finally completed, and all defects made good according to the true intent and meaning hereof, whichever shall last happen."

One of the difficulties into which the architect is sometimes landed, is that the contractor, after obtaining a certificate, thinks he has secured a guarantee that the work is properly executed, and is thereby exonerated from any liability to make good defects; but the ruling of the Courts have left him no ground for this view. It is well, however, for an architect to make this point clear in the contract by stating distinctly that no certificate he may give is to be considered conclusive evidence as to the sufficiency of any work or material, and that no certificate shall relieve the contractor from his liability to make good defective work.

Final certificates are legally classified as either of payment or satisfaction, or approval of work and material, or payment *and* satisfaction. An authority on law writes: "A certificate of satisfaction need not include the amount payable, and if it does, without being so provided by the contract, it does not bind either party, except as to the fact of satisfaction." "It is sufficient to enable a builder to recover payment of the balance, though no amount is certified for," so it has been held by Jervis. When the certificate is for payment *and* satisfaction, one implies the other, so that if an architect provided that the balance of the contract price be paid to the contractor within a certain time from the certificate stating that the works are completed to his satisfaction, in law it will be held that the certificate for the amount implies one of satisfaction as well. In the case of "Clemance v. Clark," it was ruled that an architect may delegate his duties or employ others to assist him. Further, a final certificate must be conclusive and binding, for which end the architect must have power to bind his employer. Even if he does not know his business, it has been decided that if he certifies he is satisfied, the employer is still bound by the mistake. In short, nothing short of fraud or collusion will invalidate an architect's certificate; he may be unfair, but the contracting parties are still bound by his decision, and no court of law will reverse that which both parties have agreed to abide by. The power thus lodged in the architect is considerable, and in certifying, he should endeavour to exercise them honestly between the two contracting parties. As will be seen, it is the final certificate which has the binding effect; those given during the progress of the work are not conclusive, though they are conditions precedent to payment, and as such should be given only after a careful inspection or measurement of the work.

THE SOCIETY OF ARCHITECTS.

THE first ordinary meeting of the Society of Architects for the current session was held at St. James's Hall, Piccadilly, on Tuesday evening, the President, Mr. E. J. Hamilton, in the chair. The following sixteen architects were elected by ballot as members:—Henry Greig Badenoch, 21, Pilgrim-street, Newcastle-on-Tyne; Robert Bentley, 53, Church-street, Whitehaven; James Bruce, 21, Pilgrim-street, Newcastle-on-Tyne; Joseph Thomas Chambers, Shepley, near Huddersfield; Edgar Hinton Fawckner, Queen's Chambers, 41, High-street, Newport, Mon.; John Chappell Jackson, Town-hall Chambers, Boro' High-street, S.E.; David Pugh Jones, Telford Villa, Beru-road, Pontypridd; George Jones, 17, George-street, Aberystwyth; Tom Jones, 17, George-street Aberystwyth; Joseph George Needham, 11, Powerscroft-road, Lower Clapton, N.E.; Richard Barry Parker, Moorlands, Buxton; John William Rodger, 14, High street, Cardiff; Thomas Ridyard Roscoe, the Town Hall, Old-street, E.C.; Robert William Sampson, Manor Offices, Sidmouth; Louis Alfred Westwick, West Hill Drive, Mansfield; and Herbert Payne Wyatt, 30, Raeburn-street, Acre-lane, Brixton, S.W. Four nominations for membership were read.

The adoption of the annual report of the Council, of which we gave a full summary last week, p. 695, was formally moved by the PRESIDENT, seconded by Mr. ERNEST DAY, of Worcester, and agreed to.

THE PRESIENTIAL ADDRESS

was then delivered from the chair. Having acknowledged in fitting terms the honour conferred on him by re-election, Mr. HAMILTON continued:—The record of the past year shows steady progress. After careful, though entirely impartial, examination of qualifications by the council, 41 new members have been elected—being exactly the same number as in the previous year—and our Society may be congratulated on the addition to its ranks of two such distinguished ecclesiastics as Bishop Browne and Dean Farrar, and of another member who may fitly be described as a very apostle of pure art, Mr. John Ruskin. The papers and lectures of the past year have been both interesting and useful. I would urge upon all our members the paramount importance of individual effort, in order to strengthen the hands of the council in the work of the Society. Suggestions of a practical nature will always be welcomed and carefully considered. And further, by the reading of papers, and especially by regular attendance at the meetings and participation in the discussions which ensue, much material aid may be given, and the general and practical usefulness of the Society be increased. We do not exist for ourselves alone. Paragraph 3 of the Memorandum of Association states that: "The objects for which the Society is established are the promotion and advancement of architectural art and practice, and its allied arts, sciences and crafts, and the maintenance of the honour and the interests of the profession of architecture." The special feature of the present year (the details of which must perforce occupy a large proportion of the council's attention) will be the inauguration of an examination test for candidates desiring membership. I fear that some misconception exists as to our objects in this new departure; and, even at the risk of repetition, it cannot be too emphatically stated that there is on our part no desire to compete with, or exercise rivalry against, any other examining body; nor do we aspire to the dignity of a general examining centre for the profession. We are certainly not prepared to accept the heavy responsibilities which such an aspiration must involve. Our object is a very simple one, and such as one would have supposed it would readily be conceded that every learned or technical society had a perfect right to maintain. We desire only to secure a fair test of proficiency for our own membership; and, whilst we welcome all fair criticism, we cannot help feeling that it does not always come with the best of grace from those who have already guarded themselves with a like precaution. That such a position is not unnatural I am fully aware, and I earnestly trust that we, on our part, having taken means to safeguard our own Society from incompetence, may not settle down in the enjoyment of a sweet but selfish contentment. The larger question of the compulsory examination and registration of all architects is of undiminished importance, and must be kept well to the front! The pressure of public business, combined with opposition where we might reasonably have looked for support, has, up to the present, delayed the passing of the Bill; but, meanwhile, interest must not be allowed to flag. Members may do much by embracing opportunities of speaking of the matter to their friends and clients, and thus aiding public opinion, which is such an essential factor in the successful issue of a public measure. Personally, I cannot say that I regard examinations as an absolute panacea for all professional ills. Nor should the mere removal of grievances nor the securing of personal rights be the main purpose of our efforts. Our primary aims should be two-fold: first, the furtherance of architectural art; and, secondly, the promotion of public benefit. To what extent, then, are universal examinations calculated to secure or assist these ends? Examinations are evidently not creative—they are but tests. The education which leads up to them is of prior importance; and it has been with this end in view that the council, in framing the list of qualifying examinations, which shall be accepted in lieu, or partly in lieu, of the Society's examination, endeavoured to give full recognition, as far as practicable, to all institutions providing a regular and protracted course of study. It is eminently satisfactory to note that the Government is becoming increasingly alive to the importance of the study of architecture, though they might do well to recognise more fully and materially aid existing institutions, which are most ably providing opportunities for such study. It is gratifying to observe also the somewhat rapid growth of facilities for architectural training in the great provincial centres, by means of lectures and classes, to which Mr. Penrose referred the other evening in his able and most practical address before the Royal Institute. I readily admit there are dangers in examination —dangers of what Mr. Caröe has lately and aptly described as stereotyped efficiency, yet there is not much ground for fear as to a full development of the artistic spirit. Examination cannot create this spirit, neither can it fitly *test* it. But education itself is not creative; it only cultivates existing faculties by drawing out powers possessed, and by the enlightening influence of added knowledge. No plans we can formulate will limit our profession to true artists; and though a really good architect cannot be produced without the "artistic sense," yet those who lack it, but still join our ranks, must be the better for education. So, too, will the true inborn artist need education if he is to become a really good architect. The creations of art will be faulty without the aid of science, for we work not in fantasies, but in stone and brick, wood and iron; and not only the stability of our buildings, but their real artistic worth must in large measure be regulated by our knowledge of the properties of the materials which we use. Now, such kinds of knowledge can very well be tested by examination, as can also in large measure the history of our art, although I confess that the underlying principles of the various styles of architecture may be too rigidly formulated. It is for this reason that I would urge the wisdom of framing examinations on as practical lines as possible. You cannot test the artistic spirit by examination, and if there be danger of fettering its free development in the process, it lies rather on the art side than the practical. An extensive and accurate knowledge of the nature of the materials and principles of construction can prove no check to the development of art; but it is, on the contrary, essential to its exercise in connection with architecture. To architectural students examinations are of very real value. Entering an architect's office at an age when the seriousness of their life's work has hardly yet been grasped, compulsory examinations would prove a most valuable stimulus to solid work. They would also afford a means of directing and regulating the bent of a young man's studies. For, notwithstanding recent improvements, there are yet very many, perhaps the majority, of students in the provinces, who have no opportunity for attending classes of architectural study. Nevertheless, we must bear in mind, and the student must not forget, that the successful passing of the examination is not the goal to be sought; real education is the important thing —an education which shall not stop short with merely "satisfying the examiners"—a factor which may bear too strong a ratio to the benevolence of these gentlemen, whose task is often a difficult one. Rather an education which shall train the eye to see and the mind to think, the memory to store and the intellect to use. An education which shall have for its aim the execution of noble work. Not necessarily of great work, in the sense of magnitude or elaboration of ornament; but of work noble, because true, chaste, and beautiful; executed with materials suited to their ends, and wrought with a knowledge of their properties, the plan of the building well devised to serve its purpose, and the design fitly expressing its uses. No calling demands of its followers such versatile knowledge or the exercise of such varied gifts as that of architecture. Artistic feeling, knowledge of materials and construction, if practicable, experience of handicraft in the workshops, ability to draw, a sound acquaintance with mathematics and statics, a study of ancient examples, aided, where possible, by travel, a good business capacity, a sound judgment, together with a measure of legal knowledge. It is evidently only exceptional men who can really be masters of all these things; yet the catalogue is by no means strained. Considerations of expense will rarely permit of a student securing an effective training in them all. With the one exception of the artistic feeling they are, however, all of a nature which can be brought under an examination test, although some of them, as, for instance, actual handicraft, could scarely, under present conditions, be held compulsory. It is well, indeed, that a due elasticity should be given to the examinations by offering to candidates, where practicable, a choice of subjects, or by making some papers optional, thus giving scope for the particular bent of the candidate's tastes. These, then, are some of the considerations which show that examinations are calculated to be beneficial to architectural art, by better equipping those who exercise it. The benefit which would accrue to the public is briefly, though comprehensively, set forth in the preamble to the "Architects' Registration Bill"— "Whereas it is expedient that persons requiring professional aid in architecture should be enabled to distinguish qualified from unqualified practitioners." It is now generally admitted that such facilities should exist. A large majority of architects at least are practically agreed upon two further points; first, that the public are lamentably deficient in capacity to judge for themselves on this head; and, secondly, that compulsory examination tests would in a large measure help to secure the desired end. The Royal Institute of British Architects has twice virtually admitted this principle. In the year 1859-60, a resolution was passed by the Council recommending "the initiation of a scheme to be cautiously and gradually developed and brought into working order, in which too much should not be attempted at the onset, but which, in accordance with the rule now established in other professions, the ultimate result should, in their opinion, be the establishment of compulsory examination extended to all architects, whether members or not of this Institute." No effort to give effect to this resolution appears to have been made for over 30 years; but in the year 1890 the opinion of the Institute was again tested at a special meeting, when the following resolution was carried by a large majority: "That while not opposed to the principle of compulsory examination as applied to those about to practise architecture, this Institute is of opinion that the difficulty of restricting by statutory powers the practice of architecture to those who have passed an examination is at present so insuperable that it is undersirable to make an immediate application for such powers.". These facts sufficiently prove that whilst for reasons which it is not for me to suggest, the Royal Institute has hitherto opposed the Bill, it nevertheless endorses its main principle. It is, of course, a fact that the great majority of houses are now erected without the superintendence of an architect. This might still be the case even after the passing of the Bill; but it would, nevertheless, tend to give employers assurance that they would get a *quid pro quo* for fees expended on professional assistance. In addition to this, the surveyor of every district, whose duty it is to examine all plans and certify all buildings, would, under the Act, have to be a properly qualified architect. The public benefits of Registration are such as have been admitted and given legal effect to in other professions, such as law, medicine, &c., and the Society of Musicians is now moving in a similar direction. The applicability of the principle to the architectural profession has been recognised in other countries by the passing of a Government measure in Ontario and by efforts in the same direction in France, America, and Australia. Both the justice and wisdom of the measure are indeed so generally recognised that I am constantly meeting with persons who imagine that compulsory registration actually exists, and are amazed to find that it does not. It is difficult to see what can be gained by delay. The question has been well threshed out, its objections fairly met, and only a united front is needed to insure the speedy passing of the Bill. On the broadest grounds, therefore, of the public weal, and of the common interests of the profession, I would respectfully urge the co-operation of the Council of the Royal Institute with the Registration Act Committee in the furthering of the scheme. I feel strongly confident that they would find hearty support from a majority of their own membership; and I am fully assured that the Society of Architects would be ready, in no spirit of jealousy, to continue its active support of the measure. Passing to more general topics, may I ask you to glance with me at certain considerations affecting the ordinary every-day life of an architect in the exercise of his calling. That such a life is often more arduous than rosy will be confirmed by the experience of not a few of my colleages. To most young men possessed of any measure of ambition there come visions of large commissions and conceptions of princely structures, which shall rise up into the sunlight under their fostering care and earn for them a just renown! Such are, however, in the vast majority of instances, dreams—destined to be unrealised. It is only one architect in a thousand who has the opportunity of erecting large and magnificent buildings. The great bulk of architects have to content themselves with humbler work, and added to this the fact that architecture is for us in a very practical sense "a calling," as being the means of maintaining ourselves and our families, tends often to tone down very materially the dreams of youth. Especially in the provinces men have often to undertake duties which are not altogether congenial to artistic natures, and the daily routine of office life is sometimes tedious. There is in all this much danger of our best faculties being thwarted and dwarfed, and our highest instincts buried in "the daily round, the common task." There may be some who need to be reminded that truly great work is not always regulated by magnitude, nor real beauty by costliness: that it is worth while to put one's soul into the design of modest structures, and to expend time and thought on very simple details. For, after all, the effect of the many less important structures in influencing and moulding the public taste is greater than that of the few stately buildings here and there. The façades of the houses, shops, and warehouses which line our streets—our country dwellings framed in foliage, and cottage homes in groups or terraces—the proportion of the rooms in which we sit for hours, and the refinement or vulgarity of their ornament. These are subtle influences farther reaching than has as yet been at all fully recognised. We must all of us have frequently been conscious of the charm felt in looking upon some very simple work; some quiet façade, devoid of all stately features which may deck its neighbours, clamouring for observation, yet well proportioned, with well-balanced window openings, every line telling, every moulding chaste; or some cottage or small country house, it may be devoid altogether of ornament—a lack which nature soon supplies—yet exquisite in form and colour, telling in sky-line, and with a home-like look of comfort; and we are ready to grant that as much genuine pleasure may be derived from such sights as from gazing upon the most magnificent pile which the mind of man can devise.

Unfortunately, upon these simpler works the average capitalist very often does not seek our aid, imagining the builder and merchant can give him all he wants. Be it ours, then, to show by the superiority of our work, that we can give him something worth securing. I am fully aware of the difficulties which surround us in the attempt, and difficulties which do not obtain to an equal degree in other professions. When a man consults his lawyer he is willing to place himself in his hands, because he is conscious of his own ignorance; but the man who builds is rarely so ready to admit his ignorance, or to recognise the fact that years of study and practice have raised the level of his architect's judgment in matters of taste above that of his own. The limit of cost insisted upon is often too far below what is necessary for good building, the reason for this being that the estimate has been arrived at by a comparison with actual work which has been executed, though very indifferently, elsewhere; very possibly by a speculating builder. These are very real difficulties which lie in our path. But they are not insurmountable, and rightly met may serve as an impetus to noble effort. We must, doubtless, be prepared to make sacrifices—to refuse to worship the Baal of vulgar taste for show and display, quieting our conscience with golden commissions. If we would serve the highest interests of our art, we must often run counter to popular admiration, and frequently be called to exercise much tact and patience in relation to our clients. But the end is worth the effort. For a true record of our life's work would take but little cognisance of the vastness of the accumulated sum expended upon our buildings; it would rather recognise the extent to which we have wrought into our work the principles of truth and beauty, and the faithfulness with which we have discharged all the functions of our art. Working in this spirit, we may all achieve something worth the doing, and leave behind us "footprints on the sands of time." Our footprints in this sense, however, if we have built well, will be like the petrified rain-drops imprinted on ancient rocks. The more need, therefore, that they should record our best effort. Perhaps there are few of us who have not wished at times to pull down and rebuild our former works, and especially is this the case with architects in the provinces, who have to live with their works, and whose mistakes are ever staring them in the face. If it be thought that in all this I am trenching somewhat on the province of the preacher, I can only reply that I do not recognise this sharp distinction between sacred and secular. Art has indeed been often called the handmaid of religion! Her claim, however, rests not in the limited sense of mere association with the externals of Christian subjects, but rather in the embodiment of noble principles. It has been said that "art is more god-like than science; science discovers, art creates." Yet this is not wholly true. There is only one Creator, and art, too, is but an explorer and an interpreter. She seeks for truth and beauty—not as a mistress, but as a humble student. Yet she is greater than science. Science merely explores and discovers; art interprets and applies. Good materials, sound construction, graceful proportion, chaste ornamentation—these are foundation principles upon which we may raise superstructures of beauty, whether stately or humble, simple or ornate. Our work lies in applying these principles to our building—gaining our knowledge from science, our vision from art.

At the close the President was accorded a hearty vote of thanks, on the motion of Mr. Ernest Day, seconded by Mr. H. G. Quartermain, and supported by Messrs. Henry Lovegrove, A. R. Finch, and G. A. T. Middleton.

◆

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

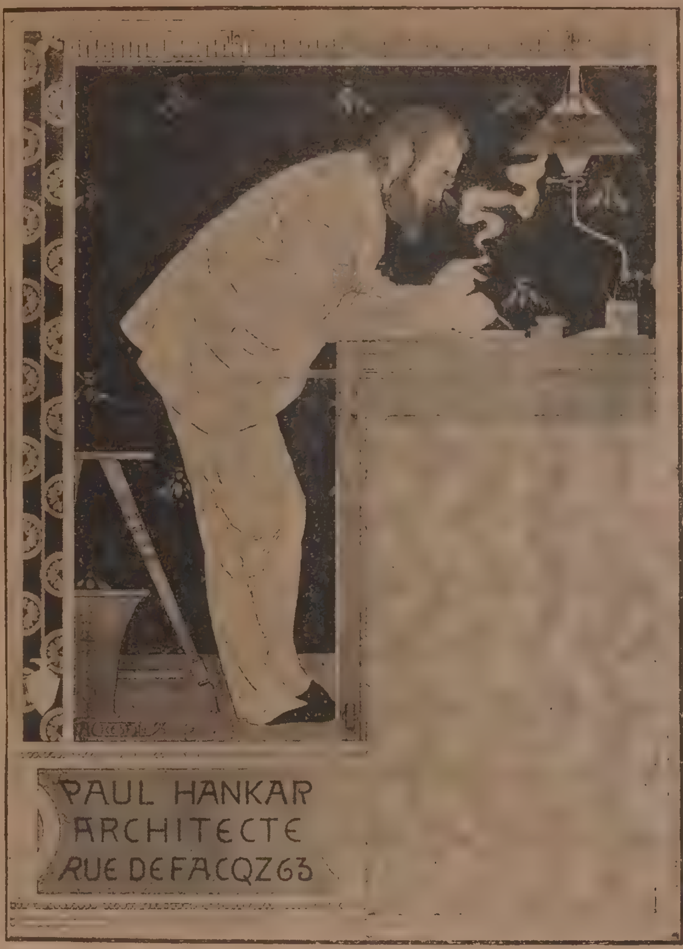
The second ordinary meeting of the Institute for the session was held on Monday evening, Mr. F. C. Penrose, F.R.S., the President, in the chair.

On behalf of a body of subscribers, Sir Arthur W. Blomfield, A.R.A., formally presented to the Institute a portrait of Mr. James MacVicar Anderson, ex-president.

THE SCULPTURED COLUMNS OF THE TEMPLE OF DIANA AT EPHESUS.

A paper on this subject, illustrated by photographs of the remains found by the late Mr. J. T. Wood, and now in the British Museum, and by drawings of conjectural restorations of the temple, was read by Mr. Alexander S. Murray, LL.D., F.S.A., the Keeper of Antiquities at the British Museum, and a discussion followed.

◆



AN ARCHITECT'S POSTER.

Mr. PAUL HANKAR, a Belgian architect, has advanced, it would seem, somewhat upon the ordinarily accepted rules of professional etiquette current among architects in London as to the question of advertising, seeing that this gentleman has had recourse to a poster with his portrait upon it and address under his name. We herewith illustrate the design, which, in many ways, is quite admirable, and as a poster seems to leave little to be desired. The scale and plumb line decorate the margin, while set squares are very decoratively contrived in a pattern by the side of the drawing-table, against which Mr. Hankar is depicted at work, and enjoying in the meantime a quiet smoke, indicating ingeniously to would-be clients how congenial an artist their architect is likely to prove. The warmth of the gas-lamp, too, is drawing the smoke from the master's cigar very naturally in graceful curls up under the shade. Mr. A. Crespin is the author of this very capital design, in which the conventional is thus cleverly combined with the naturalesque. In the hands of a less capable artist and draughtsman, it is easy to imagine what terrors some architects' posters would very likely become if the profession in this country were to follow up the idea of advertising by posters. Some architects already use some exceedingly ugly headings to their office notepaper, which in every way are devoid of beauty and good taste. What the posters of such gentlemen might be like is enough to make the reckless shudder, and while we can but admire Mr. Crespin's design for Mr. Hankar's placard, we certainly cannot advocate its imitation as a suitable method for the development of architectural practice. Our indebtedness has to be acknowledged to Messrs. Geo. Bell and Sons for the loan of this illustration, which is taken from a highly interesting and eminently artistic book just issued by that firm under the title of "Picture Posters,"* giving examples in all countries, with descriptions by Mr. Charles Hiatt, who has, with no little ability, written an illustrated *résumé* of the picture placard or poster from the earliest days of such things down to the present time. Samples among the English varieties are reproduced from the pencils of Walter Crane, Fred Walker, Herkomer, Sir John Millais, Stacy Marks, Ed. Poynter, Sir James Linton, Charles Green, Dudley Hardy, Maurice Grieffenhagen, and others, down to Aubrey Beardsley, not forgetting to name A. Morrow's "New Woman," and Bernard Partridge or the Bros. Beggarstaff, whose work is among the best. The French examples, too, are most entertaining, while many of the American designs are exceedingly clever and well drawn. This is not exactly the place to describe such things at length; but inasmuch as our public thoroughfares must always, nowadays, be more or less enlivened by placard advertisements, it is undoubtedly of no little importance that the designs employed for the purpose should be both good in colour and drawing, with a due observance to suitability of decorative effect. The attention which the subject is now receiving at the hands of some of our most capable artists is an encouraging sign of the times, and this charming book of "Picture Posters" will go far to enhance the merit and character of such productions. Most persons with any love for the artistic side of contemporary art would be glad to possess so capital an assemblage of attractive placard designs.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XVII.—FRENCH RENAISSANCE: FEATURES AND ENRICHMENTS OF THE EARLIER WORK.

By the time that the Renaissance had completely ousted the Gothic general outlines in France, the smaller enrichments had not changed much from those which had for a time commingled with the Gothic, and had been used to beautify Gothic forms. They, and the minor features also, appear to have been based on the delicate and imaginative work found in the interiors and in the monuments of Florence,

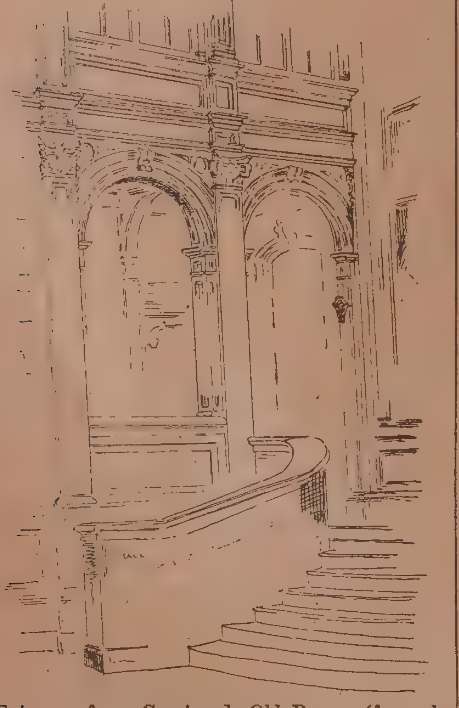
Three Capitals from the Hôtel d'Ecoville, Caen.—(*From* Sauvageot.)

having much the same perception of proportion, and making a very similar use of finely-drawn mouldings and of low-relief carving. An example of this is the altar-piece in the north transept of Dol Cathedral, which might just as well have been designed and made in Italy, so far as all absence of characteristic French feeling is concerned.

That the pilaster was much employed has been already mentioned; but to how great an extent it is not at first easy to understand, though, perhaps, it was not always a true, but a false, pilaster which was used. Portions of wall—such as door, dormer, and window-jambs—were panelled in so similar a manner to the pilasters proper, that they frequently have the appearance of being themselves pilasters, and sometimes inadvertently receive that name, though in many instances they act more as antæ.

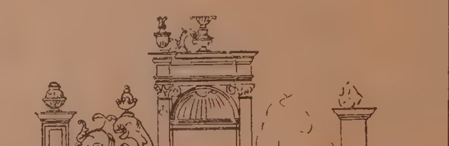
This panelling, which may be noticed upon the accompanying illustrations of the entrance and door of the Hôtel d'Ecoville (now generally known as the Old Bourse) at Caen, is usually rectangular, like that of Florence; but it is not infrequently found in a diamond-shaped pattern, as in the pedestals to the pilasters flanking the door.



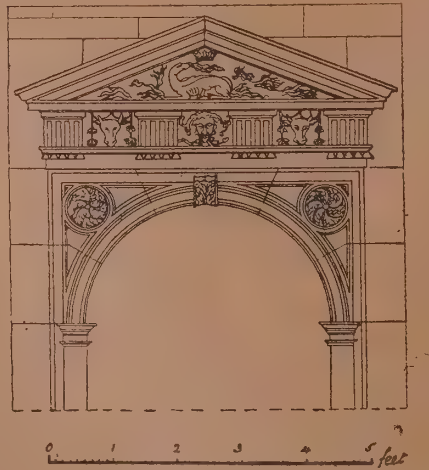
Entrance from Courtyard, Old Bourse (formerly Hôtel d'Ecoville), Caen.

As for the carving, this, as usual, is easier to show than to describe. While being somewhat similar to the Florentine in motive, the surface to be enriched being covered with well-designed scrollwork amongst which animal life is frequently found, it yet partakes of a peculiar spray-like appearance, apparently the last relic of the Gothic admixture which had but recently been in vogue. The grace of it all is perfect. The little figures which occur are always exquisite specimens of modelling, and as they are found as often in the capitals as elsewhere, it is frequently quite impossible to ascribe these to any definite order.

Enlarged details of three capitals which appear in the view of the court-yard entrance of the Hotel d'Ecoville show that they are dissimilar, and that while all are ornamented with the acanthus leaf, and have the abacus shaped on plan as usual in the Corinthian, yet the projecting horns, usually carried by the tendril volutes, are in one supported by cornucopiæ, and in another by hoofed human figures, facing inwards and with the heads bent down, like porters carrying weights upon their backs. In the second, too, a tiny nude figure is introduced, and two others, smaller still, appear above it.



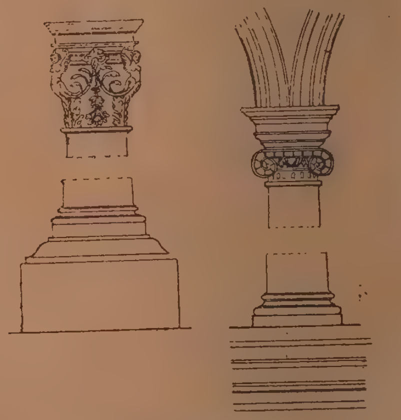
Doorway in the Old Bourse (formerly the Hôtel d'Ecoville) at Caen.—(*Measured by* Mr. E. R. Barrow.)



Detail of a Door of the Staircase in a House at Orleans.—(*From* Sauvageot.)

In the doorway to the same building, again, there is seen a monkey seated upon the continuation of the impost moulding, and flanking the door on either side, while the pilaster capitals have horses' heads in place of volutes, and birds where the Corinthian caulicolæ would be, and so on, *ad infinitum*;—endless variety and equally endless beauty, for these are all so charmingly composed and well executed, in subordination to simple and still unobtrusive general lines, that the effect is perfect.

Another doorway, from a house at Orleans, is an example of the employment of a Doric frieze, spoiling an otherwise beautiful piece of proportioning, or, rather, tending to spoil it, for it scarcely does so entirely. Still, the use of the heavy triglyphs and metopes is an evident mistake, out of harmony with the general delicacy of the whole, and with the usual feeling of this, commonly known as the François Premier, period. It is illustrated to show how easy it is to spoil a good thing, rather than an example of what was then common. The columns and capitals from the same building exemplify the best traditions of the period—free and artistic use of Classic details, kept in subservience to a well-thought general design, without slavish copyism of either the ancient or the contemporaneous work of Italy.



Details from a House at Orleans.—(*From* Sauvageot.)

COUNTY LUNATIC ASYLUMS.—XXXIII.

By George H. Bibby, F.R.I.B.A.

DISTRICT ASYLUMS ABROAD AND AT HOME.

THERE has always existed, unfortunately, a strong prejudice which has led the friends of the insane to seek extreme privacy for them, and thus exposing them, not merely to inadequate accommodation and treatment, but to all the imaginable evils attending their becoming objects of financial speculation. In a great measure the deficiencies of the private and public houses for the insane of former days have long since been satisfactorily dealt with, and at the present time any defects that may be found in the smallest private asylums or the largest county asylums, whether *structural* or otherwise, are liable to be advertised in the annual reports of the Commissioners in Lunacy for England, Scotland, and Ireland. Much of the earlier legislation was directed for the benefit chiefly of the insane poor, not observing the fallacy that because the sane rich are well able to take care of themselves, the *insane* rich must be so too.

A private asylum for the richer classes might well be planned upon the lines of a good hotel or boarding-house, providing every means of cure, and every requisite for the comfort and happiness of the patients, and all precautions against their illegal detention. The question of accommodation may decide that of the terms of payment. A patient requiring special rooms and attendance, and a separate table, should contribute to the funds of the establishment a larger sum, in proportion, than those who are contented with the accommodation provided for all. These are, in fact, the principles on which a family hotel (as well as many other forms of public enterprise) are carried on, and it would be well for the community that all these institutions should be frequently visited by committees from time to time, as are county asylums; and no private asylums

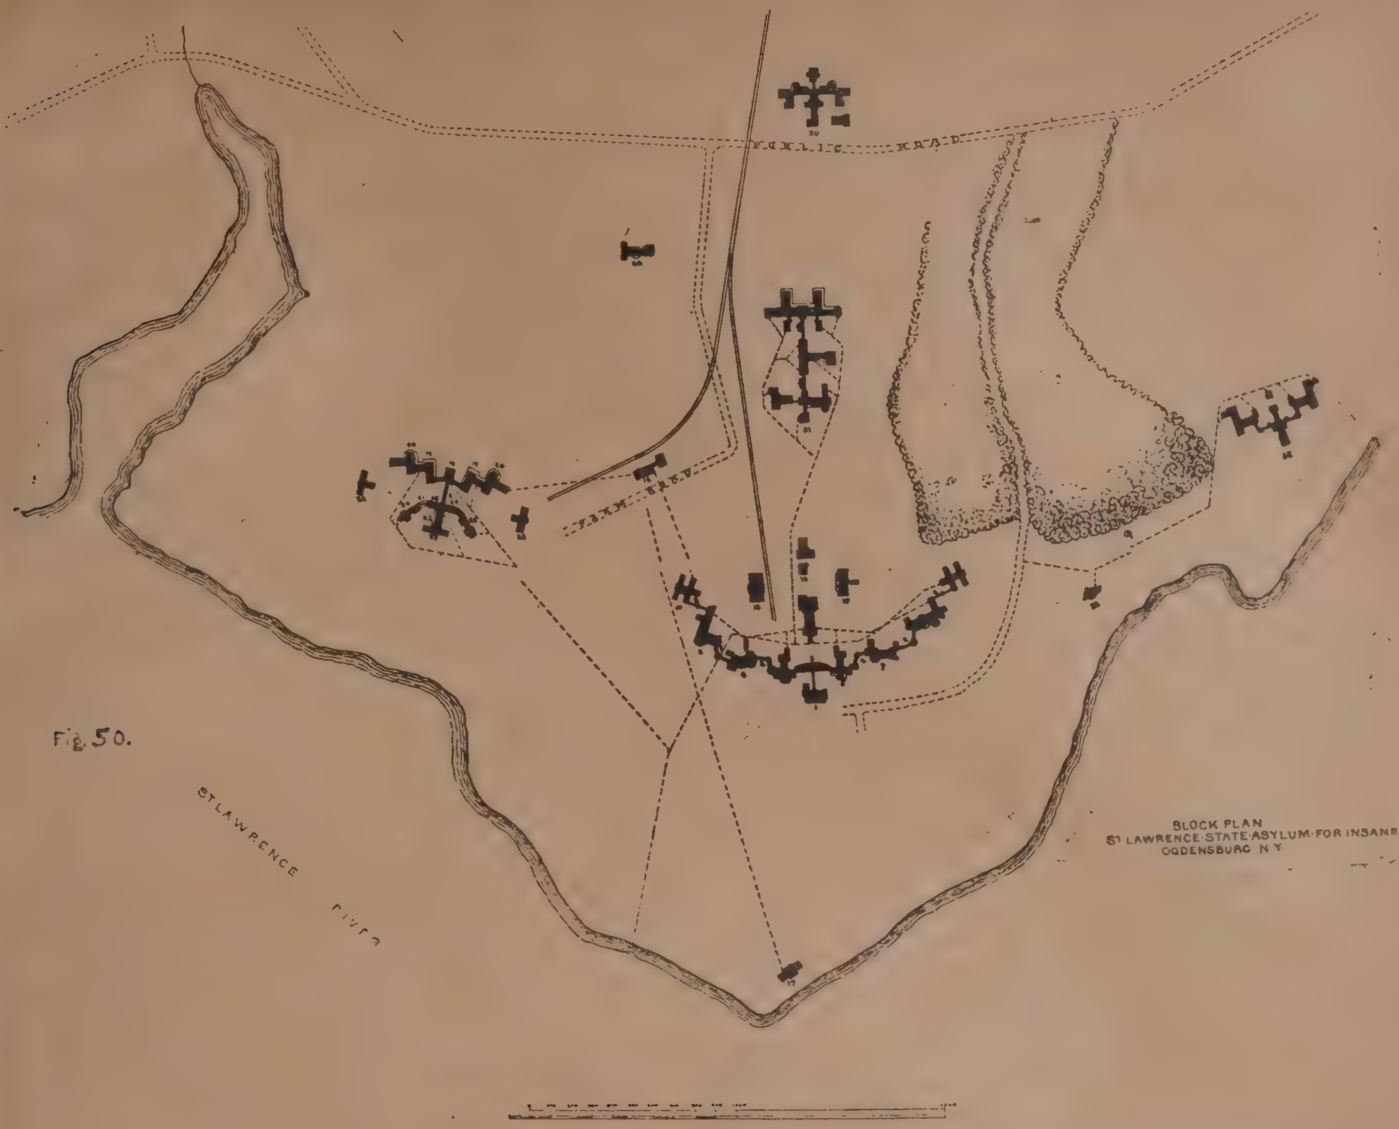


Fig. 50.

should remain unvisited by either local or departmental authorities.

While the poor derive benefit from the better food and care of the public asylum, the rich patients in private asylums are beneficially influenced by causes relatively similar. The internal arrangements, therefore, of a private asylum should be in accordance with the tastes and occupations of the inmates, and the tedium of uniformity must be prevented by such aids as are employed for like purposes in everyday life: billiards, books, and music are not enough; there should be social reunions with a view to affording opportunities for mixing in the society of persons of sound mind. This is a point of great importance, for "to have the world and its recreations brought from time to time into contact with the insane, is less valuable even as an amusement or a pastime than as a means of satisfying them (especially when allowed to meet their friends or relatives) not only that they are not forgotten, but that their return to the world, its business and its duties, is still looked for with anxiety and delight."

The family group in an asylum is, or ought to be, associated in conversation, light reading, and all the diversified occupations that embellish refined society, with no other restraint than what individual circumstances may require, or the knowledge of the medical superintendent of the house may dictate.

In this description of asylum the patients should be the guests and associates of the superintendent and his family, amongst whom may be assigned the duties of moderating the impressions from without, and of regulating the desirable degrees of intercourse with the world. Here the first public efforts of a returning healthy mental activity should meet encouragement, and here those doomed never to know the happiness of recovery experience protection and even pleasure to the measure of their faculties.

The ever-watchful kindness, the considerate forbearance in the discharge of duties often irksome, harassing, and even dangerous, and the ready inventiveness to suggest new thoughts to cheer and amuse, are difficult to secure, and are generally looked for in vain in the private lodging or the private family, and whatever comparison may now be made between British, American, or Continental lunatic asylums (either private or public), there is reason to believe that our Continental neighbours were in progress of being freed from the evils of defective systems prior to the improvements of asylum management and construction in this country.

Many of the American asylums are of considerable extent, and have elaborate structural arrangements; the plans in some instances are upon the separated cottage system, and the areas of land occupied are therefore very considerable; others are upon the old-fashioned block arrangements.

Those asylums built upon the cottage plan may be conveniently connected in their various departments with subways or tunnels, in which may be inclosed electric wires, gas, steam, or water pipes. Many asylums are lighted by electricity; indeed, in the United States generally, electric lighting has for many years been more extensively used than in England, and during a visit to America so far back as the year 1888 I was surprised to see quite small villages in out-of-the-way parts of the States of Ohio, Indiana, and elsewhere brilliantly lighted with electric lamps.

Amongst several American asylums where scientific management of the insane is carried into effect are the "Johns Hopkins" Hospital, Baltimore (which is said to possess the best laboratory in that country); the Maryland Hospital for the Insane, Catonsville, Baltimore; the New Jersey State Hospital, Morris Plains, New Jersey; the Danvers Lunatic Asylum, Massachusetts; the St. Lawrence State Hospital; the Government Hospital for the Insane, Washington; the Toledo Asylum for the Insane, Ohio; the Columbia Asylum for the Insane; the Utica State Hospital, New York; the Alabama Hospital for the Insane, Tuskaloosa, Alabama; and the McLean Hospital, Boston, Massachusetts.

The Utica State Hospital is said to be the oldest established of the New York State asylums, and is erected in the Classic style with a fine entrance; it is a three-story building, and contains nearly 1,000 patients, who are looked after by about 100 day attendants and about a dozen night nurses. It is erected in stone, upon an estate the area of which is 200 acres; the structural arrangements are considered to be unsatisfactory. This is scarcely a matter for surprise, as it is the first building of the kind erected in this State; but the establishment having the repute of being excellently managed, with special arrangements not usually found in asylums, I regret to have been unable to call at Utica during my journey from the Western States.

Amongst other arrangements at the Utica State asylum the bathroom appears to be particularly noticsable, as it is entirely without baths!

The bathroom is lined to a considerable height with marble polished slabs, and has a floor with inclines from each side leading to a central gutter.

The patients are provided with an adjoining dressing-room, also with adjacent lavatories, urinals, and water-closets.

When ready for the bathroom, the attendants receive the patients in turn and place them under a fixed spray of water, which may be heated to the exact temperature required. If the patient be unable, or reluctant, to cleanse himself, or restive, &c., the attendant (*who is attired in a bathing-dress*) soaps him down, and washes him by means of a portable jet, with indiarubber piping.

This appears to be a very easy mode of cleansing the insane—easier for the attendant, and better for the patient, inasmuch as no bath-cleansing is necessary, neither is it possible for more than one person to be bathed with the same water.

About three miles from Ogdensburgh (which is situated on the southern banks of the River St. Lawrence, in the State of New York, and somewhat north-east of Lake Ontario) is the St. Lawrence State Hospital, which is said to stand upon an estate of nearly one thousand acres. This asylum was commenced to be built during my stay in the United States in the autumn of 1888, and has cost about £250,000, inclusive of land and all fittings and appliances ready for the reception of 1,500 patients. It was built in sections, and the patients were received in instalments as the various buildings progressed, and the grounds were laid out for the whole estate concurrently with the erection of the buildings, which are arranged with a central and several detached blocks having the usual administrative offices. The materials used are red sandstone and rock-faced granite.

The general arrangement is very unusual, and the institution is spread over a considerable area, as will be perceived from Fig. 50, the reference to which is as follows:—1, Administration building; 2, corridors; 3, general medical office, library, and dispensary; 4-5, reception cottages; 6-7, observation cottages; 8-9, cottages for convalescents; 10-11, cottages for disturbed patients; 12, kitchen building; 13, amusement hall; 14, laundry building; 15, employés' dwellings; 16, boiler-house; 17, pumping station (The foregoing include all the central blocks.) The infirmary blocks are as follows:—18, Administration building; 19, day-room; 20, dormitories; 21, corridors; 22, kitchen; 23, infirmary for men; 24, infirmary for women; 25, dining-room for men; 26, dining-room for women; 27, employés' rooms; 28, detached buildings; 29, cottage for farm help; 30, block No. 2; 31, block No. 3; 32, block No. 4; 33, superintendent's house.

The central or hospital block is three stories, and the remaining portions are either one or two stories in height. The water supply is from the St. Lawrence River, and the sewage is discharged into the same river, but lower down. There are about 250 attendants, being at the rate of about one to every six patients, a liberal provision beyond which is usually allowed in the county asylums of this country, except for cases of a specially difficult or dangerous character.

The architectural character of asylum erections in this country, as well as the grouping of the parts on plan, are usually much left to competing or selected architects; but the chief points to which attention is directed, and upon which asylum committees usually insist, are soundness and economy of construction, simplicity of design, economy with reference to working, supervision, and future extension, and a strict conformity to the instructions and suggestions for the construction of asylums issued by the Commissioners in Lunacy, and the too-close observance of which has, in some instances, precluded architects from exhibiting originality in their plans or great improvements in their proposed arrangements.

(*To be continued.*)

CONCERT HALLS AND ASSEMBLY ROOMS.—V.

By Ernest A. E. Woodrow, A.R.I.B.A.

THE parish-room of later date has developed considerably beyond the cold, unfurnished schoolroom formerly used for parochial entertainments, and we find, as in the case of the illustrations of this chapter, that it may become—and has, in some cases, advanced into—a hall for theatrical performances, as well as for general assemblage, with a proper stage, and brick proscenium wall.

By the courtesy of the architects, Messrs. J. E. K. and J. P. Cutts, who have kindly lent me their drawings for the express purpose of illustrating my remarks in this chapter, I am enabled to draw attention to a case where the parish-room of St. Andrew's, Fulham, has been built, under the directions of the vicar, the Rev. E. S. Hilliard, by the skill of the architects, so that it complies so far with the regulations of London County Council as to enable them to obtain a dramatic, as well as a music and dancing, license. Here we have a hall, 36ft. wide by 50ft. long, of such a size to accommodate 342 persons, built with a stage having in miniature all the necessary stage appliances so that stage plays can be produced; there are the usual traps, battens, flies, wings, &c., of the stage of the theatre proper, and there is even, in addition, something which is not found in more than half-a-dozen London theatres—viz., a fireproof asbestos curtain, filling the proscenium opening. The proscenium wall is, of course, of brickwork, and built to pass through and above the roof, as in an ordinary theatre. Beneath the floor of the hall are the club-rooms, with separate exits, used for the clubs in connection with the parish.

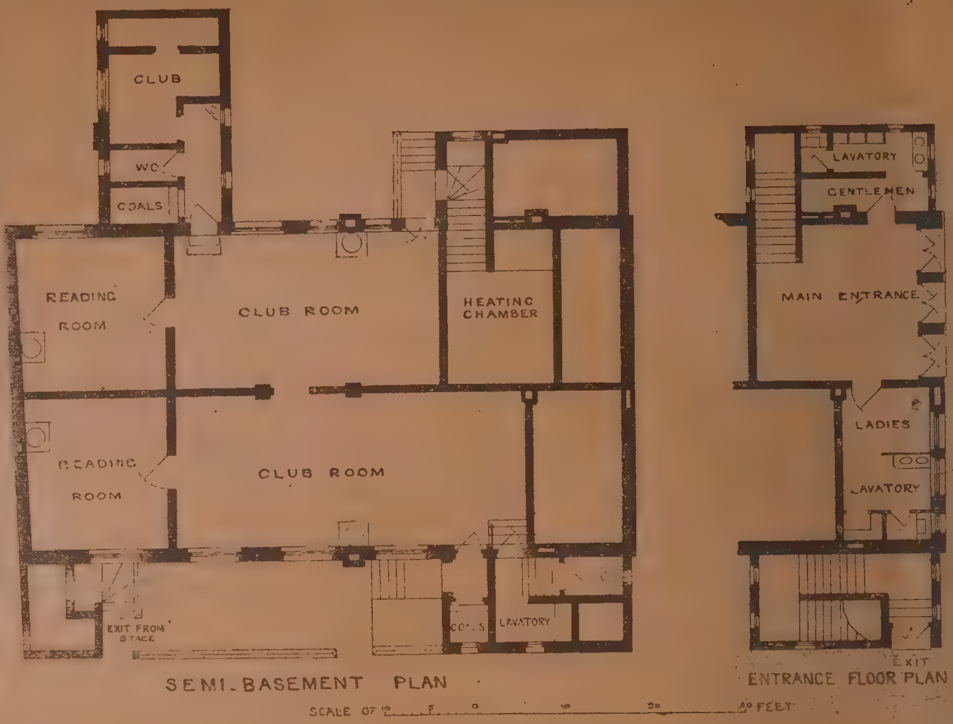

Fig. 1.

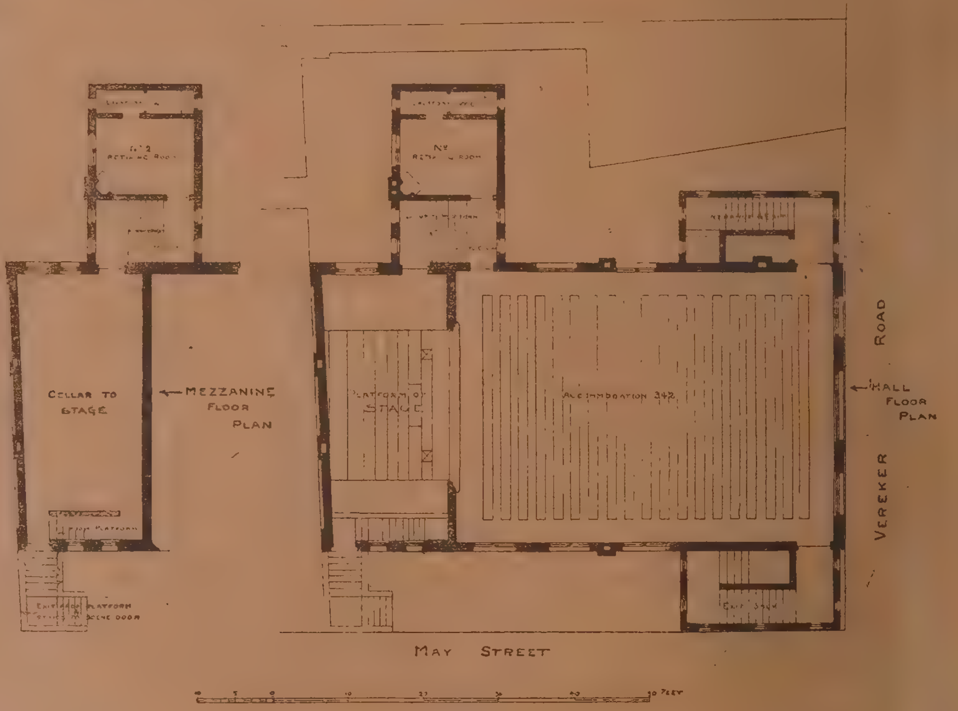

Fig. 2.

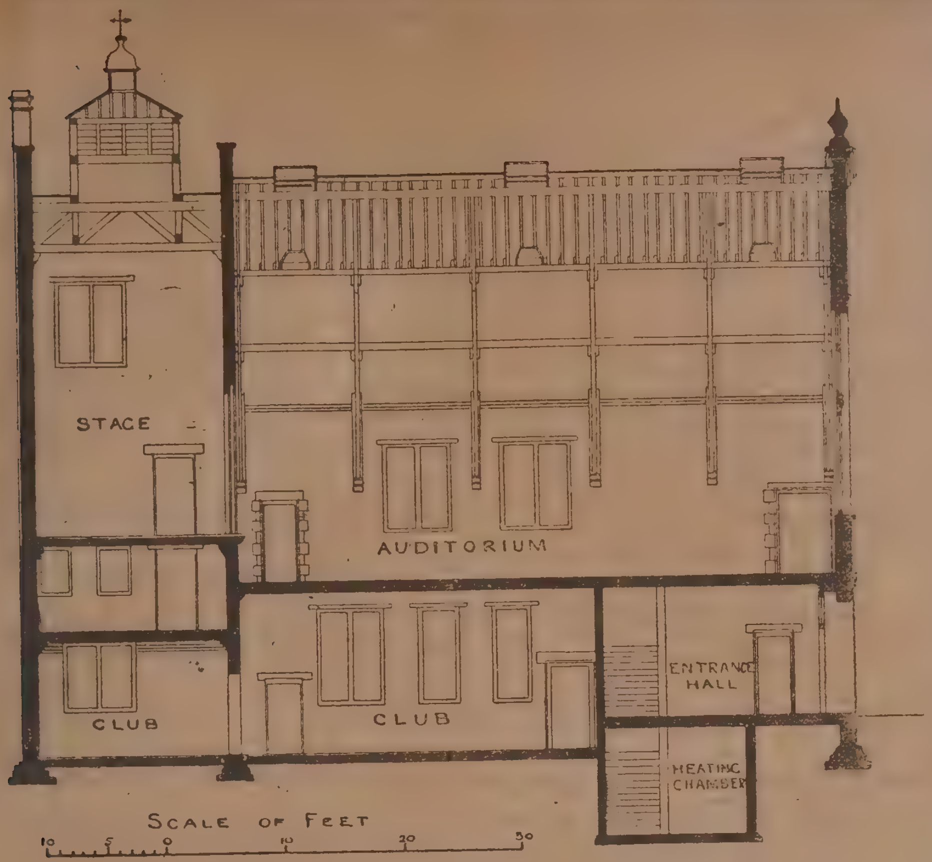
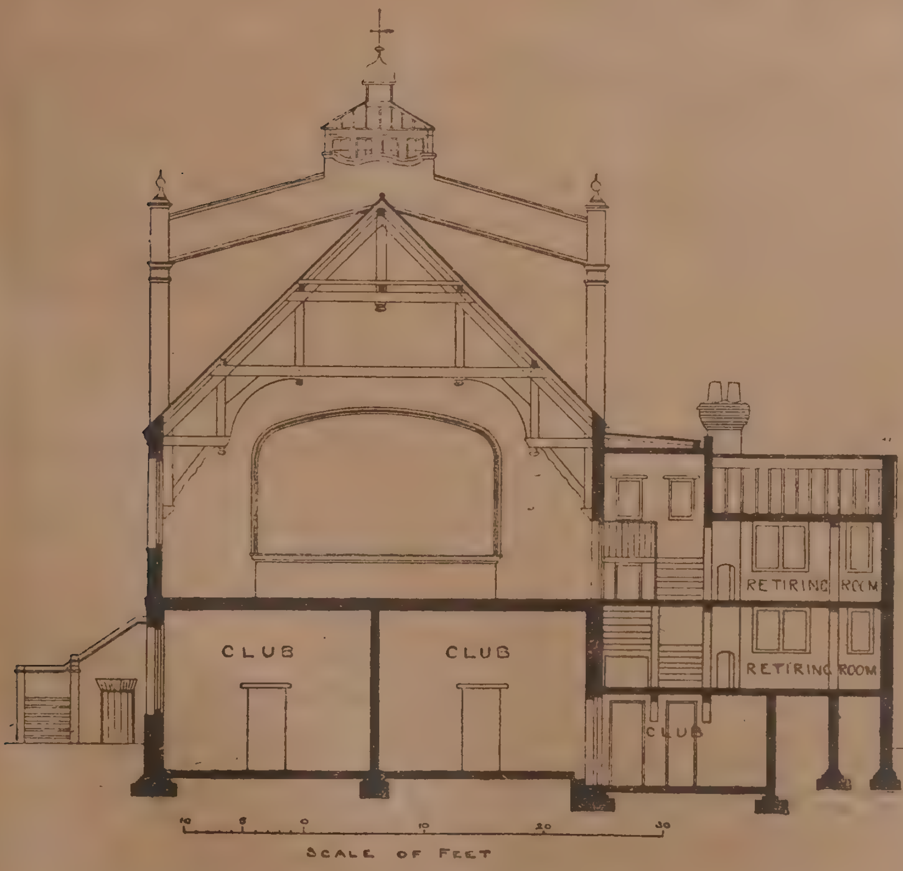
The hall has its separate entrance staircases, 4ft. 6in. wide, in accordance with the regulations; it also has its exit staircase in addition of the same width. Its gas arrangements are safe from public interference, its fire appliances are of the pattern used by the Metropolitan Fire Brigade, its doors are fitted with automatic bolts, and in general all the details of the Council requirements are complied with.

Here we have a case of good work being carried on in a good structure; but how frequently do we find what is known as parish work carried on in structures totally unfit for the purpose—dangerous death-traps. The better the work, the better the structure should be. There is no excuse for bad planning, dangerous staircases, the meeting of one or more streams of people upon a common landing, and such-like familiar defects in planning within a building, because the work carried on there is of a charitable character. A teetotal lecture-hall should be as safe from the risks of fire and panic as a music-hall with all the privileges of drinking, smoking, and promenading; the teetotal fanatic is as likely, in excitement, to create a panic as the frequenter of a music-hall, and the life of the one as well as the other should be protected by good planning. The architect should never be carried away by the thought that a narrow and winding staircase is good enough to be admitted in a hall of this kind, although it would not be permitted by the authorities in a theatre of varieties. It may be said that there is not the same risk from fire in a parochial hall as there is in a music-hall on account of the stage and scenery used in the latter; but there is an equal risk of false alarms, stampedes, and panics from causes of excitement and mischief amongst the audience. I have mentioned before the probability of these false alarms



LONGITUDINAL SECTION

FIG. 3.



CROSS SECTION THROUGH AUDITORIUM

FIG. 4.

occurring in assembly rooms of all classes, as the fanatic, the mischief-maker, or the rogue may find his way into any assembly. It is the same in dealing with old cases as in dealing with new: old structures used for the parish and philanthropic gatherings should be as stringently supervised as the regular places of public amusement. The older they are the more likely they are to require such supervision and reconstruction.

So closely associated with the parish-room is the club-room and the working men's club, that mention may well be made of these buildings in this chapter. Frequently, as in the case of St. Andrew's Parish Room, they form one and the same building, and, at times, the rooms of the club are used as the retiring-rooms, cloak-rooms, dressing-rooms, and refreshment-rooms for the hall when it is used for public entertainments.

The club may, of course, contain any number of rooms, such as reading-rooms, library, billiard-rooms, card-rooms, smoking-rooms, dining-rooms, kitchens, caretaker's living-rooms, &c., according to the particular requirements of each individual case. There is, however, one thing which I wish to point out, and that is—that wherever there is the slightest risk of fire occurring in these adjuncts to the club, the whole of these rooms should be structurally separated, by fireproof floors and walls, from the hall where the assemblies take place, as is done in Messrs. Cutts's design. There should be distinct and separate entrances and exits for each part, and no communication of any kind whatever through which fire or smoke could travel to alarm the audience of the assembly-room. This is a most important point in planning buildings of this class—a point too frequently overlooked by the architect, on account of the convenience to the management which such communication affords.

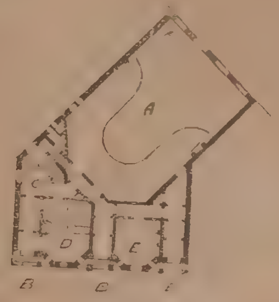


FIG. 6.—A, hall; BBB, entrances; C, staircases; D, smoking-room; E, retiring-room.

More particularly do I insist upon the desirability of such separation when kitchen and living rooms form part of the scheme. Probably, when only such apartments as reading-rooms and billiard-rooms exists, the risk is small; but even then there should be a separate exit from these rooms to those used by the audience of the hall, as is the case in the illustrations of St. Andrew's Rooms.

In connection with working men's clubs there are frequently large concert-rooms. An example is given (Fig. 6) of an existing working men's club, not as an example which should be copied, but as one to illustrate what is embodied in a building of this class. The diagram shows that there are three entrances—one to the left, leading to the club, the other two to the hall, which has a gallery. The hall is 53ft. long by 36ft. wide, and will seat on the ground floor about 450 persons. There are baths beneath the hall, and the front portion consists of a club, with reading-room, smoking-room, and billiard-room, &c., on the ground and two other floors. There are also kitchens, connected with all the floors by a lift.

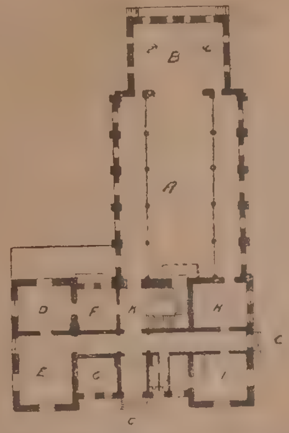

FIG. 7.—A, hall; B, stage; C C, entrances; D, billiard-room; E, club-room; F, reading-room; G, waiting-room; H, dining-room; I, kitchen.

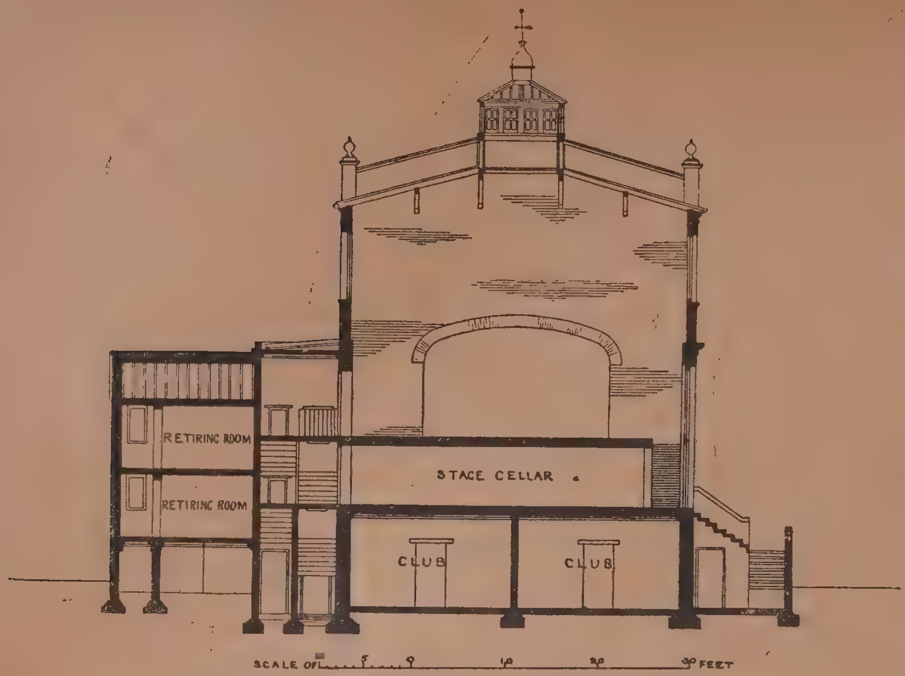
Here is an example of the club and assembly-room in one fire risk, with all the exits passing



SECTION THRO' STAGE LOOKING TOWARDS AUDITORIUM

FIG. 5.

in one direction—passing, indeed, through the club premises. Should a fire occur in the club, the occupants of the hall would have their retreat entirely cut off. As there is a street at the back, it is strange that no exits are provided at the end of the hall, away from the club-house: it shows a lack of knowledge on the part of the architect of the essential provisions for the safety of the audience.

In Fig. 7 I produce a plan of the Steelworkers' Union Club at Osnabrück. The hall is 40ft. wide by 62ft. long, and has a stage 30ft. by 23ft. at one end. The hall is connected with a club, having a billiard-room, reading-room, and visitors' room, kitchen, &c. There is no separation between the hall and the club in this case, and the only exit from the hall is through the club, so, as in the last case, should there be a fire in the club, the people could not get out.

The working men's club-house, with its assembly-room, is a building frequently to be met with abroad in connection with large works. For instance, in December, 1890, Mr. A. F. Krupp presented to the officials and staff of his factory a building entirely for their own recreation and enjoyment. This was a structure erected in connection with an hotel, also the property of Mr. Krupp, and it contains a large room for dances and festivities for the employés, a large dining-room, reading-room, bowling-alley, billiard-rooms, &c. The officials pay an entrance fee of five shillings, and an annual subscription of six shillings, which money goes towards supplying books and the sixty technical journals, including among them the BUILDING NEWS, which are taken in for the use of the members.

THE GREAT TITCHFIELD STREET TECHNICAL SCHOOLS.

AS we briefly mentioned last week, a very successful inauguration took place on Thursday evening, the 14th inst., of the season's work of the Trades Training Schools, conducted at 155, Great Titchfield-street by the Carpenters, Tylers and Bricklayers, Masons, Plasterers, Wheelwrights, and Painter-Stainers' Companies, in conjunction with the British Institute of Wood Carvers. Mr. E. Smith (master of the Carpenters' Company) presided, and Professor Banister Fletcher, J.P., C.C., as chairman of the committees, presented to Mr. F. C. Penrose, F.R.S., P.R.I.B.A., an address of welcome. He then read the reports received from the judges of the work done in the schools. The Tylers' and Bricklayers' Company's report showed that the practical problems both in the elementary and more advanced types of gauged work had been executed by the students in a workmanlike manner, and they had also shown steady progress in their drawing and in the technical knowledge acquired. In the masonry class one student had brought to a successful finish one bay of the cloister of Gloucester Cathedral. Other students had built a staircase, elliptical on plan, with winding stairs and raking arch, &c.; a section of a dome, a circular-headed tunnel on a circular plan, full-size groining springers, &c. In the carpentry classes they had completed models of roof trusses, king, queen, and mansard, together with a trussed partition, dragon tie-piece with hipped rafters, a framed centre with all the various joints in carpentry, horizontal and raking shores, framed floors, &c. There had been a slight decrease in the joinery class on the entries of last year, that being mainly due to the unsettled state of the building trade in London. The Joiners' Company had now associated themselves with the other companies in furthering the technical work undertaken. The plumbing classes had proved successful, and the instruction comprised roof work and sanitary plumbing. Good practical work had been done in making balusters, modillion blocks, trusses, and moulding, some in plaster for casting and pressing in Portland cement, cutting moulds in iron and zinc, wax, and gelatine mouldings. Fibrous plaster was shown in making reverse moulds; casting from theory and forming girder casings; setting out on the bench a portion of the panelled ceiling; laying down the ribs and moulding it, ready for casting. With regard to the wood-carving classes, they relied for support, as regarded pupils, entirely upon the trade. Some students were at work during the whole day carving, having expressed a wish to improve in drawing or modelling. Great success had attended the classes in every department.

Mr. Penrose expressed his pleasure at hearing so satisfactory a report, containing as it did so much hope for the future. Some years ago architects were in despair at the idea that the old apprenticeship system, which had fallen so much into abeyance, was likely to be discontinued. The great City companies had, however, revived the practice, and, through their munificent assistance, that and other technical schools in London had been formed. The co-operation of the Architects' Association with the schools was extremely interesting to him. It was of the greatest importance that young architects should be able to study at an institution of that description, and he hoped that its success would still continue. An inspection of the various workshops was then made.

INTERNATIONAL BUILDING TRADES EXHIBITION.

HANDICRAFT COMPETITIONS.

IT will be remembered that when the prizes were handed to the successful competitors at the Royal Agricultural Hall, in April last, the Duke of Fife stated that certificates would be prepared, and given to those competitors who were not so fortunate as to obtain medals.

A cleverly-drawn certificate has been prepared by Mr. H. Phillips Fletcher, A.R.I.B.A., and copies of these were handed last week to the undermentioned craftsmen, by Prof. Banister Fletcher, J.P., F.R.I.B.A., the chairman of the consultative council:—Carpentry, S. Evans; plumbing, W. Webb and W. J. G. Traquair; plastering, W. T. Drew; masonry, J. Hawley; bricklaying, F. Mills.

CHIPS.

Colonel Sir Thomas G. Glen-Coats, Bart., has promised to erect a drill-hall on a site in High-street, Paisley, adjacent to the Coats Memorial Church. It is understood that the new structure will cost £5,000.

Mr. Walter Emden's scheme for the utilisation of the site of Her Majesty's Theatre in the Haymarket, embraces the erection of an Imperial Opera House, a restaurant, an opera club, and sets of shops and residential chambers. The share capital is fixed at £250,000, and debentures to the extent of £200,000 at 4 per cent. have already been applied for. The new opera house is to be more commodious than any theatre in the metropolis, having seats for 2,784 persons.

The monthly report of the Labour Department states that the building trades continue well employed, though there has been a slight seasonal decline. The percentage of unemployed members in unions making returns is 1·9, compared with 1·6 last month and 3·8 per cent. in October, 1894. The furnishing and woodworking trades also continue busy, the percentage of unemployed union members remaining at 2 6, as in September, compared with 4 6 per cent. in October, 1894.

On Saturday a meeting of the creditors of Robey E. Carpenter, architect, Burton-on-Trent, was held at the Midland Hotel, Burton, Mr. Hall, assistant official receiver, occupying the chair. The liabilities were stated to be £874 9s. 8d., and the assets, after deducting £16 5s. 8d. for preferential claims, £89 15s. 10d. Mr. W. Bennett was chosen as trustee, and a committee of inspection was appointed.

The free library committee of Dundee have accepted from Mr. J. Martin White, M.P., the gift of a picture by Mr. Arthur Melville, A.R.S.A., A.R.W.S., which, after being hung in the Fine Art Exhibition, will be placed in the permanent gallery.

The national memorial to the late David Owen, the Welsh novelist, will take the form of a monument, to be erected at Mold, his native town.

The crematorium and chapel of the Scottish Burial and Cremation Society are to be opened by Sir Charles Cameron on Wednesday next. The buildings have been erected in the Western Necropolis, Maryhill, Glasgow.

A remarkable improvement has taken place in the trade of the North Staffordshire Potteries with the United States. In volume of product for the American market, it exceeds in the period ended Saturday, with seven weeks of the year to spare, the highest record. The trade with Australia and the South American Republics is also improving steadily.

A Welsh Baptist chapel, erected from the designs of Mr. Glynn Davies, was opened on Monday at Glenadda, Bangor. Mr. D. Owen, Glyngarth Post-office, Llandegfan, was the contractor.

In commemoration of the bicentenary of the death of Dr. Busby, head master of Westminster School for 57 years, his successor, Mr. Rutherford, has presented to the school a marble bust of the famous autocrat, executed by Mr. T. Stirling Lee.

The Ipswich Corporation have approved of designs for a drinking fountain and shelter, prepared by Mr. Brightwen Binyon, of that town, which some subscribers have offered to place in the newly-acquired Christchurch Park.

The Bishop's Waltham Water Works Company propose to extend their limits of supply, and will go to Parliament next session with a Bill empowering them to lay mains to Curdridge, Swanmore, Droxford, Hambledon, and other places in the district.

The Southampton Corporation discussed, on Wednesday week, the question of new municipal buildings. The controversy turned on the question of site, a committee submitting a report in which they unanimously recommended that the buildings be a section of the portion of the public lands in the centre of which the statue of Lord Palmerston now stands. The report was rejected by 27 votes to 13, several members regarding the scheme as premature, and others objecting to the appropriation of common lands.

NEW PARISH CHURCH AT CRATHIE. — INTERIOR OF THE MERCHANT TAYLORS' HALL.—MEDICAL SCHOOL, QUEEN MARGARET'S COLLEGE, GLASGOW. — NEW SCHOOLS AT DERRY. — PREMIATED AND OTHER DESIGNS FOR MODEL DAIRIES.

Our Illustrations.

NEW PARISH CHURCH, CRATHIE.

The Queen's church at Crathie has a special interest, and the accompanying photographs from the building, which was recently opened, will accordingly be welcomed by our readers. The architect was Mr. A. Marshall Mackenzie, A.R.S.A., from whose description we print the following :—The church stands halfway between Ballater and Braemar upon the shoulder of a hill, surrounded by birch and larch trees, looking down upon the valley of the Dee, with the old churchyard and manse close by. It stands east and west, and is cruciform, having nave, transepts, and a good-sized apse at the east end, with a central tower at the crossing. The material used for the walls is a beautiful light grey granite. The walls are built of finely-jointed ashlar, showing the natural rock face produced by the stone being split, without leaving any tool-marks on the exposed surface. The mouldings are finely dressed with sharply-cut hollows and clean-edged fillets, intended to contrast with the broad surface of the rock walling, and to mingle a little lightness and grace with that feeling of strength and duration which is always produced by well-built granite masonry. The roofs are covered with light grey slates from Conniston, in Westmoreland, and at a distance the difference between the grey of the slates is hardly distinguishable from the grey of the granite walls. The windows in the transepts are three-light lancets, a precedent for which is afforded by the south transept aisle of Pluscarden Priory. The door at the Queen's entrance was suggested by the door of the north transept at Pluscarden. The windows in the nave have three mullions and tracery of the Decorated period; one example like it is to be seen in the south aisle of Jedburgh Abbey. The outside measurements of the tower are 25ft. by 24ft., and 64ft. high to the parapet. The steeple, which is slated, rises 36ft. higher than this, making a total height of 100ft. 6in. The copper weather-cock which terminates the steeple is a reproduction of the old one which used to surmount the steeple of St. Nicholas Church, Aberdeen, and is still in existence. The steeple carries four fine bells, cast in Munich, and given by Princess Louise and Princess Beatrice. The bells are hung partly outside the steeple, with slated hoods over them. The entrance is at the west end, protected by a large open porch constructed of wood and slates. From the west door, the length to the east end of the apse is 106ft., the width of the nave is 24ft. 4in., and the height 30ft. The south transept is entirely devoted to the accommodation of the Queen and Court, and has a separate door. The north transept accommodates the vestry and pews for the heritors of the parish. The apse measures 23ft. wide and 24ft. long, having a semicircular end. The crossing of the nave, transepts, and apse is marked by four wide stone arches which support the centre tower. The arches spring from four massive pillars, measuring 4ft. 3in. in diameter, giving a girth of about 12ft. 9in., and built of fine axed granite. One of the stones of the base of the south-east pillar was laid by her Majesty the Queen, with much ceremony, on the 11th September, 1893. The floor of the apse is raised by four steps of white granite. It is lighted by five lancet windows, their sills having an elevation of 9ft. above the level of the floor. The windows of the rest of the church have also been well raised above the floor. Those in the nave are 8ft. up, and in the transepts 14ft. This is a point of some importance which the architect was particular about, knowing well the unfortunate effect of low windows; and, on the other hand, the becoming effect of light admitted from as high as possible. The rose window in the west gable is purposely kept as high as possible in order that the light from it might be cast upon the apse at the east end from a point behind the congregation. The surface of the walls in the interior is treated in the same way as in the exterior—viz , rock ashlar and finely-dressed mouldings. The windows have widely-splayed sides, with moulded drop arches over. A high dado of panelled oak surrounds the lower part of the walls next the pews. The ceiling is lined with wood between the principals, which are arched, and the floors of red tiles, herring-bone pattern. The church is rich in royal gifts. The Queen has filled the south transept window with stained glass.

CITY GUILDS.—XIII. : THE HALL OF THE MERCHANT TAYLORS' COMPANY.

We gave an account of the history of the buildings of this great City company in our issue for October 25th last, written by the architect to the Court, Mr. W. Hilton Nash, F.R.I.B.A., who lent us plans and details to accompany his article. This contribution was supplemented by Mr. John Hebb, assistant architect to the London County Council, in a letter which we printed on the 8th of the present month. To-day we give a view of the Great Hall, showing the upper end of the apartments, with the Master's chair and high table. To the right hand is the old Gothic bay window, recently opened up and thrown into the hall.

MEDICAL DEPARTMENT, QUEEN MARGARET'S COLLEGE, GLASGOW.

This adjunct forms a complete section in itself, apart from the college building. It is to be used for the anatomical and physiological departments of the work. The slope of the ground admitted of the whole of the preparation departments being placed in the basement without any excessive excavation. The communication between this and the ground floor is by means of a lift. The scheme of the ground floor is simple; the dissecting room, lecture-theatre, museum, &c., entering from a central hall lit from the roof. The rooms of the anatomical department are intercommunicating, and admit of an easy supervision. The dissecting-room, theatre, and museum are lighted from the roof, the latter room being the height of the two stories. The stone used in the construction is the sandstone from Gifnock Quarries. The opening ceremonial took place last Monday, and the building will forthwith be in constant use. The architects are Messrs. John Honeyman and Keppie. The drawing which we reproduce was exhibited this year at the Glasgow Institute of the Fine Arts.

FIRST DERRY PRESBYTERIAN SCHOOLS (SELECTED DESIGN).

These schools were erected last year on the City Wall, Londonderry, by the congregation of First Derry Presbyterian Church, at a cost of about £3,000. The design adopted by the building committee, which bore the motto "Mitchelburne," was selected from amongst those of fourteen competitors. Accommodation is provided for 460 children. The ground floor is occupied by the infants' schoolroom, classrooms, &c., covered playground, cellarage, latrines, and other conveniences, and on a mezzanine floor are apartments for the caretaker. The first floor is devoted to boys' and girls' schoolrooms, classrooms, &c. Advantage has been taken of a rapid fall in the ground to obtain separate access for each department with a reduced number of steps. The two schoolrooms on the first floor are separated by sliding shutters, so that they can be thrown into one large hall when desired, for purposes of lectures, meetings, and entertainments. The materials used for the exterior are Bridgwater brick and concrete. The general contract was performed by Mr. Joseph Ballantine, builder, and the plumbing and gasfitting work by Mr. W. Shannon. Mr. W. E. Pinkerton, M R.I.A.I., of 8, Diamond, Londonderry, was the architect.

FIRST AND SECOND PRIZE DESIGNS FOR DAIRIES.—(THE BRITISH DAIRY FARMERS' ASSOCIATION.)

These buildings have been planned to meet the requirements of modern scientific dairy farming. The chief points are convenience and compactness of arrangement combined with economy of construction and working, due regard being given to a plain but pleasing exterior. In both plans the arrangement is similar, and the aim has been to make them as convenient as possible for the proper treatment of the milk. They consist of butter- and cheese-making rooms, with milk-setting room adjoining; also a large scullery, boiler-house, and coal-store. The larger dairy is arranged either for working by steam or hand-power, but the smaller for hand-power only. The buildings generally are constructed of red brick with tile roofs, the floors being laid with tiles, and in the boiler-house and scullery with cement. The butter, cheese-making, and milk-rooms have glazed brick dadoes. In these rooms are disposed the various dairy appliances, such as the milk-separator, churn and butter-drying machine, cheese-tub and presses, curd-mill, and other necessary machines. The milk-room is is fitted with slate or marble shelves on which are placed the setting-pans. On the first floor is the cheese-room, fitted movable revolving cheese-racks, and a tank-room containing a cistern supplied with filtered water for all purposes. The cost of the smaller dairy is estimated at £450, and of the larger at £650, fitted with machinery complete. The architect is Mr. Chas. A. Callon, A.R.I.B.A., of 2, Prince's Mansions, Victoria-street, S.W., and Aylesbury, Bucks, who was awarded the first and second prizes for these identical plans in the recent competition at the Agricultural Hall, to which we lately drew attention.

BUTTER AND CHEESE DAIRY.

This design for a dairy was also submitted in the competition held by the British Dairy Farmers' Association, held at the Dairy Show at Islington, and these plans received the "commendation" of the judges. The main point to be considered was that the arrangement should admit of expeditious working, and special attention was to be paid to the ventilation, warming, sanitation, cleanliness, &c. The materials proposed are red brick and rough-cast, with tiled roof; the lower part of the internal walls to be glazed bricks, with cement above; the floors granolithic, having glazed earthenware channels where shown. The curing-room in the roof to be lined throughout with wood. The author of these plans is Mr. Charles W. Battie, of Hornsey-road, N.

CHIPS.

The Duke of Newcastle claimed £2,360 from the Manchester, Sheffield, and Lincolnshire Railway Company as compensation for the subsoil and minerals extracted from his property in Nottingham through tunnelling operations. Mr. Cripps, Q.C., M.P., who arbitrated, has allowed in his award £198.

It is proposed to fill the windows of the ancient and interesting parish church of All Hallows Barking with stained glass.

In the application for discharge from bankruptcy made on behalf of Herbert Hutley Billing, Rose Villa, Dollis-road, Church End, Finchley, N., builder, the order has been suspended for six months, ending Feb. 14, 1896.

A new block for idiots has just been completed at the Hants County Asylum at Knowle, near Fareham. It is already occupied by thirty-seven patients. During the past year a committee of the Hants County Council have had under consideration the question of installing a water-softening apparatus to deal with the hard water which is obtained from the new pumping-station, and scheme for the carrying out of the work is promised for the next meeting of the county council.

Col. J. Ord Hasted, Local Government inspector, held an inquiry at St. Austell on Tuesday week relative to the application of the urban district council for permission to borrow £1,200 for works for water supply. Originally, sanction was given to borrow £3,000 in respect of the Carne Stentee water scheme, and the present application was for another £1,200 additional.

Building Intelligence.

Bamber Bridge, Preston.—At Bamber Bridge, Dr. Moorhouse, Bishop of Manchester, consecrated on Tuesday the newly-erected church of St. Aidan, on which about £4,000 has been expended. The building consists of a chancel, north and south transepts, and side chapel, two eastern bays of the nave, organ chamber, and choir and clergy vestries. The west end has been left for future extension. The church, when complete, will consist of a wide and lofty nave, with side arcades, the aisles being used as passages only. The north chancel aisle is arranged as a chapel, the vestries and organ-chamber being placed on the south side of the chancel. Externally the building has been faced with Yorkshire stone parpoints, red Rainhill stone being used for all dressed work. The roofs are covered with North-country green slates, with red ridges, and the gable over the chancel arch is surmounted by a bell turret. Internally the walls are faced with red brick; but those of the chancel are plastered. The woodwork throughout is of pitch pine unvarnished. The portions now erected provide seating accommodation for 450 worshippers. The style adopted is Late Decorated. The building has been carried out from the designs and under the superintendence of Mr. R. Knill-Freeman, F.R.I.B.A., of Bolton and Manchester, whose design was selected in open competition. The contractors for the work were Messrs. Moore Brothers, of Rawtenstall, and Mr. J. Yates, of Bamber Bridge, has acted as clerk of works. The church was illustrated by perspective, elevation, section, and plan in our issue of Feb. 23, 1894.

London County Council.—At Tuesday's meeting of the Council a report by the Parks and Open Spaces Committee, to the effect that the Council could not legally make a contribution towards the cost of purchasing Churchyard-bottom Wood, Highgate, without further Parliamentary authority, was approved after some discussion. The Asylums Committee reported that they had approved the plans prepared by their architect, Mr. G. T. Hine, for the New Heath Asylum at Bexley, the cost of which might exceed the sum of £350,000, exclusive of site and equipment, sanctioned by the Council. The main building would provide for 1,845 patients, and in addition there would be provided a villa for 35 farm workers on the male side, and two villas each for 35 women and a special hospital villa for 50 women, making a total of 1,100 women and 900 men. Their action was approved. The Works Committee submitted a detailed account of the works they had completed, in which they showed that of the total value of 27 works completed and certified since 31st March, 1895, the final estimate was £122,561, and the actual cost £119,166, the estimates having been exceeded in only three cases, and that of the total of 62 works, previously certified, which had been reported to the Council the final estimate was £175,732, and the actual cost £178,454; the totals being—final estimate, £298,294; actual cost, £297,621. They set out that on estimated works the net profit was £673; on jobbing works, £376—total net profit, £1,049.

Opera Comique Theatre.—Messrs. Fowler and Hall have reconstructed the Opera Comique Theatre, which was reopened on Saturday last. The old balcony has been entirely removed, and in place thereof is a spacious and lofty pit. Two of the old stage-boxes have been removed, and the stalls enlarged thereby. Upstairs the old pit circle has been brought forward on steel cantilevers, forming the new dress circle. The cost has been about £2,000, including the redecoration and upholstering of the theatre. The contractors are Messrs. Patman and Fotheringham, and the whole was done in two days less than the contract time of five weeks. The steel work is by Messrs. Young and Co., Pimlico.

Plymouth.—At Plymouth, on Friday, a new chapel was opened at the South Devon and East Cornwall Hospital. The chapel is cruciform in plan, and consists of nave, transepts, and chancel. The style is Early English, and the external walls are of wrought limestone with Portland stone dressings, and the internal arches, jambs, and sills of Bath stone. The windows are of the lancet form, and are three-light. Each window has marble shafts, with carved capitals between the lights internally. The holy table, of oak, with a reredos of red and green marble, is approached from the nave by three steps, also of local polished marble. The benches, reading-desk, and choir seats are of oak, and the visible timbers of the roofs, with the carved bosses at the intersections, are of the same material. The floors under the benches are wood block, and the passages and chancel are laid with encaustic tiles. A bell turret of Portland stone is erected on the gable of the north transept. The work has been carried out from the designs and details of Messrs. Hine and Odgers, architects, Plymouth. The contractor was Mr. Lapthorn: Messrs. Goad did the marble work, and Messrs. Jones and Willis the wrought-iron and brass altar-rail standards, from the architects' drawings. The wood and stone carving is chiefly by Mr. S. Trevenen, of Plymouth. Mr. C. Perkins was the clerk of the works.

Sheffield.—The new town-hall, in course of erection from plans by Mr. E. W. Mountford, F.R.I.B.A., of London, will be opened next summer. It occupies a commanding site in the centre of the city, with long frontages to Pinstone-street, Surrey-street, Norfolk-street, and Cheney-row, and is faced with Grindleford stone. The main entrance is in Pinstone-street, and it will lead to the grand staircase, the council-chamber, and the mayoral reception-rooms. The latter, which face Pinstone-street, consist of three state apartments, and when required can be thrown into one, forming a hall 157ft. long and 35ft. wide. The council chamber is 60ft. by 40ft., and will seat 72 members. A public gallery on one side will accommodate 60 people. All these rooms are wainscoted in oak. Spacious corridors communicate with the departmental offices, to which there are also entrances from each of the other streets. The style is Modern Renaissance, and the bold sky-line is strongly marked by the high-pitched gables, filled with sculpture and carving. The tower, rising to a height of 180ft., will be a land-mark in all the country round. It will be crowned with a copper-dome lantern, terminating at its apex with a bronze statue of Vulcan, 7ft. high, typical of Sheffield's industries. The carving and sculpture—which have been executed by Mr. F. W. Pomeroy—are in low relief and concentrated in masses. "At first," says a local journal, "it was intended that the interior should be plainness itself, but little by little the council have yielded, and agreed to oak panelling, marble floors, and so forth, more in keeping with the character of the building." The principal contractor is Mr. E. Gabbutt, of Liverpool. We illustrated Mr. Mountford's original design, as selected in competition by Mr. Waterhouse, R.A., in our issue of June 27, 1890.

Stafford.—The new hall and offices erected for the Staffordshire County Council were opened recently. The buildings form an addition to the group of county properties, consisting of the Shire Hall, the Judges' House (two pseudo-Classic buildings erected at the beginning of the present century), and an old 17th century red-brick mansion, known as Eastgate House, used as Constabulary offices. In the new buildings the style is 18th-century Renaissance. The main entrance is from St. Martin's-place, formed by three groined stone arches added on to the old arcade of the Judges' House. The principal frontage is towards Martin-street. The building is faced with small old-style sand-faced red bricks 2in. thick, with Hollington stone dressings, and the roof is covered with rough cleft-stone slates, and the skyline is broken by two oak flêches with domical terminations. In the vestibule, which is 21ft. by 10ft., the walls, arches, and chimney-piece are of Hopton Wood marble. The main entrance hall is 36ft. by 20ft., and has a dado and doors of Burmese teak. The walls above the panelling are of Ancaster stone. The hall is lighted by a dome in the ceiling, filled with stained glass. The principal staircase is 12ft. wide, and of Hopton Wood marble. The hand-rail and its supports are of silver (polished). On the first floor is the council chamber, 42ft. by 42ft., exclusive of platform and gallery, and is seated for 100 members and officials. The walls are 35ft. high to the top of the dome, and are panelled to a height of 5ft. in Spanish mahogany. The walls above the dado are panelled in plaster. Four circular niches contain life-size figures illustrating the chief industries of the county—Agriculture, Pottery, Ironwork, and Mining—and under the east window is a figure of Justice. The ceiling is in plaster, and groined. The hall will seat 100 members, composing the full council and their officials. There are also a large committee room, 50ft. by 28ft., a smaller one, 32ft. by 23ft., and a chairman's parlour. The business hall on the ground floor is 28ft. by 20ft. The architect is Mr. H. T. Hare, A.R.I.B.A., 1, York Buildings, Adelphi, W.C., whose design was selected in competition, Mr. MacVicar Anderson being the assessor. The clerk of works was Mr. James Trill, 11, Tredegar-square, Bow, E. The contractor was Mr. H. Lovatt, of Wolverhampton, and the building has been superintended by Mr. Wilson Lovatt, assisted by Mr. J. M. Tildesley. The carving in wood and stone has been executed by Mr. W. Aumonier, of 1, New Inn-yard, Tottenham Court-road, W. The modelling and plaster enrichments are by Mr. F. E. E. Schenck, West-street, Pimlico, S.W.; leaded lights by Messrs. Pearce; lifts by Messrs. Waygood; iron-work construction and fireproof flooring by Messrs. Lindsay and Co., Westminster; and the entrance-gates and ironwork by Messrs. Starkie, Gardner, and Co., 29, Albert Embankment, S.E. The lavatories throughout have been fitted by Messrs. Shanks and Co., of London and Glasgow.

◆

CHIPS.

The Lanarkshire and Dumbartonshire Railway is to be opened early next year.

The name of Mr. Joseph Jeffery, house furnisher, at Northampton, has been placed on the commission of the peace for Northamptonshire.

The Superior Commission of the Grand Universal Exhibition in Paris of 1900 met on Monday, and unanimously approved of the financial scheme. Of the one hundred million francs required for the Great World's Show twenty million francs are to be provided by the State, twenty million francs are to be contributed by the Paris Municipality, and the sixty million francs remaining will be furnished by means of the issue of Exhibition lottery bonds.

Messrs. Dunn and Findlay, of Edinburgh, have been appointed architects of the Unionist Club-house, which is about to be built in Hanover-street, Edinburgh, on the site now occupied by the Albert Hotel.

A site has been acquired by Mr. Walter Reynolds, of the Leeds Theatre Royal, for the immediate erection thereon of a new and large theatre. The price paid for the property was £20,000, and Mr. Reynolds proposes to surround his theatre with a ring of shops. Building operations will commence almost immediately.

The contracts for the building of Mar Lodge, the new residence of the Duke of Fife and H.R.H. the Duchess of Fife, have now been settled. The cost of the new residence will be between £15,000 and £20,000. Mr. M. A. Marshall MacKenzie, A.R.S.A., of Aberdeen, is the architect.

The North Union railway bridge across the Ribble, at Preston, on the London and North-Western Railway, is about to be widened to the extent of one-half its present width. This bridge, of stone, has five arches, each having an elliptical sweep of 120ft. It was built by Messrs. Mullin and Co., of Dublin, and was opened in 1838, with the railway from Wigan to Preston; and it was enlarged to double its width in 1879-80, when a Government inspector pronounced it one of the finest pieces of masonry he had ever seen. The intention is still further to enlarge it to the extent of one-half its present width, at an estimated cost of about £100,000. At the same time the difficult north entrance to the Preston station is to be widened.

The departmental committee appointed by the Board of Agriculture to consider and report upon the steps which it is desirable to take for the better distribution and sale of Ordnance Survey maps held their first meeting on Thursday in last week, all the members being present. The committee propose to hold their next meeting on the 4th December, when it is intended to proceed with the examination of witnesses.

The parish church of Cranham has been opened after enlargement and restoration from plans by Mr. Gambier Parry. The large basso-rilievo sculptured panel under the exterior of the east window, representing the Crucifixion, and also the choir-stalls, and other wood and stone carving to the church, were executed under the architect's direction by Mr. Henry Frith, of Gloucester, who also supplied the carved oak altar-table and super-altar. The old chancel screen, which was in a dilapidated condition, has also been renovated, and Mr. Frith has erected a new carved oak screen between the chancel and organ-chamber.

Adjudications in bankruptcy have been made in the cases of William Coker, Farringdon-street, E.C., now or late Lower Kennington-lane, S.E., surveyor; William Thomas Ellis (trading as Ellis and Co.), Cambridge-road, Bethnal Green, N.E., builder; and also Alexander M'Clymont, Cathcart-road, South Kensington, S.W., builder.

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—IX.

By Joseph Horner.

OWING to the marked difference in the strength of cast iron in tension and compression, it is usual, when practicable, to cast those portions of work which are to be in tension in the bottom of the mould. All the advantage to be derived from closer metal is thus secured. This is practicable in the case of girders subject to uniform stress in any one direction only. But it is not applicable to columns on which the stresses are either uniform, or, if variable, acting in all directions indifferently at different times. Thus, for instance, in columns sustaining the girders of a bridge subject to side wind pressure, the opposite sides of the columns will in turn be in compression and tension. This will be due to the varying directions of the wind against the girders, producing bending of the columns to one side or the other. Such columns should in theory be cast upright, with heads. But it is seldom done, because more costly than the usual method of casting horizontally. Horizontal casting, as we have seen, is prolific of several evils, unless very great care is exercised in moulding, coring up, and pouring, and in subsequent testing and inspection. A test-bar will give the strength of the iron in the column, but it tells nothing at all about the evils above alluded to.

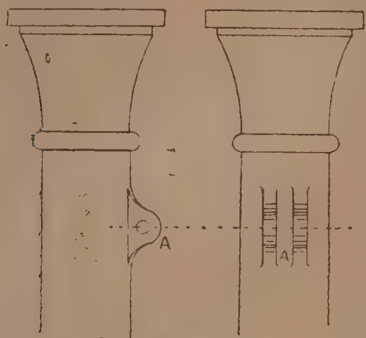

Fig. 29.

We have seen the reason why more porous metal occurs at the upper part of a casting than at the bottom, being simply because it is subject to little pressure, while that in the bottom is subjected to a considerable liquid pressure, which pressure effects its consolidation, making it closer and stronger. The deeper the mould the greater the pressure, and the sounder the lower parts of the casting. This is the chief reason why the supplementary metal termed "head" is cast upon much work that has to be tooled, such as engine cylinders, hydraulic cylinders and rams. All the spongy metal is in the head, and when this is turned or sawn off, the casting below is uniformly sound at top as well as at bottom. This sponginess is always present in some degree on the top part of all castings, and that is why founders always try to cast parts which have to be planed or otherwise machined bright down in the bottom. If the top part of a casting is machined, it almost always turns out spongy unless special precautions are taken, such as running through a skimming chamber, or allowing an extra thickness to be machined off, or casting several risers or flow-off gates. The first-named consists of a circular chamber set right in the way of the course of the metal, and which is arranged to impart a swirling motion to the metal, sending the lighter matters upwards into a riser above, and leaving only clean metal to pass on into the mould. The third named means that there is a slight flow through of metal in the mould permitted, the lighter matters passing out into vertical channels or risers. But these devices do not wholly prevent sponginess. They do, however, effect removal of the scurf, and that is something, since the presence of this is a fruitful source of sponginess. But the greater natural porosity of the metal on the top of a casting cannot be wholly removed.

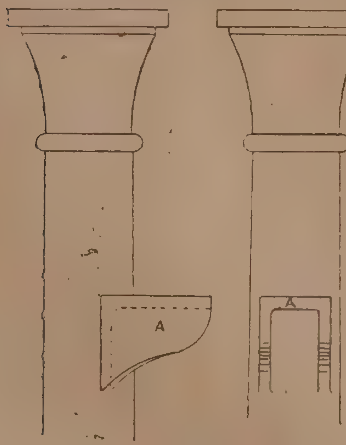

Fig. 30.

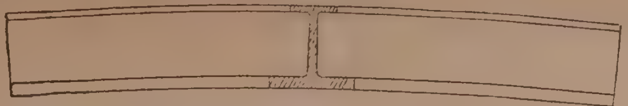

Fig. 33.

Because the lighter, more open metal always remains in the upper portions of a casting, it is always advisable, when practicable, to cast small projections and attachments as lugs, or snugs, Fig. 29, A; brackets, Fig. 30, A, flanges, &c., in the bottom. Such parts are often subjected to stresses more direct than those which occur in the body of the casting, and fracture of these spoils the whole job. When these cannot be cast in the bottom, the next best plan is to cast them on one side. When they must of necessity be cast in the top, then invariably a riser should be brought up from them to receive the sullage, and it is generally desirable also that the runner and ingate should be kept at some little distance away from them.

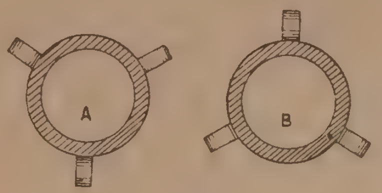

Fig. 31.

Another point is that cores ought not to be inserted in small projections, as lugs, especially in the top. They are liable to generate gas, and so increase the evil of porous metal.

If there are three lugs on a column they should be cast as at A, Fig. 31, and not as at B. At B, one lug comes at the highest part of the mould, the worst position; at A two lugs are high up, but not higher than the top of the body of the column; B would sure to come out faintly, A would be good.

Since in the case of columns the nature of the stresses is variable, so that every side may in turn be in compression, or in tension, due to the varying action of live loads, no difference, therefore, can be made in thickness as in a girder. But a slight difference is sometimes made by moulders giving a $\frac{1}{8}$in. or $\frac{1}{4}$in. more metal in the top than in the bottom (Fig. 32), to compensnte for the diminution of density in the top, as compared with the bottom. Then, if the core happens to rise $\frac{1}{8}$in., or more, which it is likely to do, the result is a curved column, which is dangerous. The side which cools the quicker in the mould will be concave, generally the thin side.

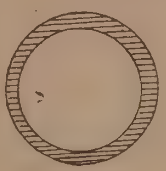

Fig. 32.

The evil of bad proportioning, pointed out in the last article, is often seen in quite different ways. Castings may be sound in the sense of being free from local massing of metal and from fractures due to sharp angles, and yet give trouble, in consequence of being crooked. Crooked castings are not only unsightly, but often unsafe; yet work may be so designed, and patterns so made, that no moulder in the world could turn out a straight casting therefrom. Something may often be done in the foundry to minimise the evil; but as often as not matters are made worse. The only thing a moulder can do is to uncover certain portions of the mould, and allow the casting to cool locally; but there are several objections to this too numerous to go into here. They may be summed up in the general remark, that castings are sounder, more homogeneous, softer, and keep their form better when allowed to cool down in the sand than when doctored by local and partial cooling. There are cases when the moulder finds it necessary to uncover and cool some portion first; but that is because he has a badly-designed job, which, if not thus treated, would almost certainly fracture.

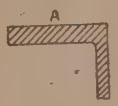

Fig. 34.

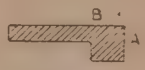

Fig. 35.

If a girder is made of the section in Fig. 33—that is, with a very unequal section, and straight lengthwise in the pattern—then the casting will come out curved, as shown exaggerated in the figure. To what extent it will curve depends on the amount of disproportion in the flanges, on the depth of the web, and on the length of the casting. It might be anything between $\frac{3}{8}$in. and $\frac{3}{4}$in. The nearer the flanges approach in cross-sectional area to each other, and the shorter the girder, the less will be the amount of the camber; so that it is easy to proportion a girder that it shall not curve at all, or at least not to any sensible extent. But if a certain design has to be adhered to—a design involving disproportion—then the pattern must be cambered to the same extent, and in the opposite direction to the casting, and the opinion of a pattern-maker or a moulder must be taken thereon. A sill like Fig. 34, with flanges of unequal thickness, will curve, going concave at A; so will a casting like Fig. 35, going concave at both A and B; so will a casting like Fig. 36 go concave at both A and B. A gutter, Fig. 37, will also go concave at A. In each of these cases the patterns must be made convex on the sides indicated, or the proportions must be altered. The latter method is far preferable whenever practicable. Of course, the metal need not be of absolutely equal thickness throughout; but there should not be any great disparity. In a massive casting there may be much greater differences in thickness than in a light one. Light castings are very sensitive to shrinkage stresses, having little metal to resist them, resembling, in this

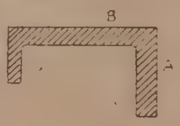

Fig. 36.

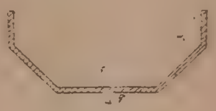

Fig. 37.

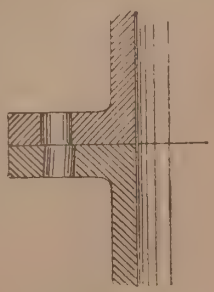

Fig. 38.

respect, sheet metals, which take a buckle so readily.

Another fault often found in castings is the inaccuracy of bolt-holes. Bolt-holes can be cast very accurately—sufficiently true for all the requirements of builders' work, if proper care is taken; but when they come as shown in Fig. 38, that means the insertion of smaller bolts, or else the straining and possible fracture of a flange by hard driving of the bolts.

BOOKS RECEIVED.

Portraits from the Plymouth Comet (published at 7, Whimple-street, Plymouth).—A series of a hundred portraits of well-known Devonians and Cornishmen has been reprinted as a sixpenny folio, with succinct biographies of the subjects. Among the many we recognise—and all admirable likenesses—are Mr. Sylvanus Trevail, F.R.I.B.A., M.S.A., who is just completing a hardworking year as mayor of Truro, a work into which he has thrown all his accustomed energy, and our vivacious correspondent, Mr. Harry Hems, the Exeter sculptor.——*Practical Trigonometry for the Use of Engineers, Architects, and Surveyors*, by HENRY ADAMS, M.Inst.C.E., M.I.M.E., F.S.I., &c. (London: Whittaker and Co.), is just what is wanted by young students, and especially for those preparing for examinations such as those of the Surveyors' Institution, where trigonometry is only incidentally required. Professor Adams has the gift of being able to put into popular language much that many other people leave incomprehensible, and not a few make confusion worse confounded of by attempts to be lucid which are merely commonplace.——Vols. V. and VI. of the *New Technical Educator* (London: Cassell and Co., Limited) are fully up to the high standard of previous numbers.——*The Cavendish Lecture, on Dreamy Mental States*, by Sir JAMES CRICHTON-BROWNE, M.D., LL.D., F.R.S. (London: Baillière, Tindall, and Cox), is an interesting little brochure to all who have studied this by-path of pathology, or take any interest in psychological subjects. Many remarkable psychical phenomena are cited. The "dreamy mental state," as it is called, is a sense of reminiscence which has occurred to many great writers—some very gifted. It is really an impression suddenly taking place in the mind that the passing moment or objects have been experienced or seen before. Thus the author quotes Rossetti's fine verse in "Sudden Light," which exemplifies this mysterious impression:—

> I have been here before,
> But when or how I cannot tell;
> I know the grass beyond the door,
> The keen, sweet smell,
> The sighing sound, the lights around the shore.
>
> You have been mine before,
> How long ago I may not know;
> But just when at that swallow's soar
> Your neck turned so,
> Some veil did fall—I know it all of yore.

The author also quotes Sir Walter Scott, Dickens, and other great authors to illustrate this dreamy mental state as experienced by masters of the literary craft. He thinks it is allied to epilepsy and other brain diseases, and that well-ordered education and mental discipline may do much to cure it. The book is worth reading by all brain-workers.——*Indian Engineering* (Sept. 28) reviews the question of narrow-gauge lines discussed at the last International Railway Congress at St. Petersburg. The meeting "finally adopted without any special reference to gauge the conclusion that a ratio of 3 : 1 for width of body to gauge appeared admissible, subject to conditions of speed and centre of gravity and of mode of suspension." As to floor space per passenger, no definite conclusion was arrived at, as the habits of different countries and the nature of traffic and length of journeys varied. Generally, for passengers standing, 1·6sq.ft. to 2·26sq.ft. each, and for passengers sitting, 2·5sq.ft. to 6·1sq.ft. were mentioned, including passages. A mean of 18in. square was stated to be necessary for comfort. In another article, the proposal to light the city of Calcutta with the electric light is discussed, and the writer advocates the support of a well-devised scheme of electrical distribution, and the selection of one system of lighting rather than two or more. Articles of mathematical interest appear. One is on the construction of trigonometrical tables, the writer showing that the sines and cosines of an unlimited number of angles, great and small, may be carried to any required number of places of decimals with little labour by means of some very simple theorems discovered by him. A well-known mathematical contributor (A. Ewbank) has another article on "Ship Lights," of some interest.——*The Antiquary* for November (Elliot Stock) contains, as usual, some interesting articles. Miss Florence Peacock has an entertaining paper on "Traditions and Customs Relating to Death and Burial in Lincolnshire," and from the number of premonitions or signs of death which she gives, Lincolnshire must be a rather superstitious county. The traditionary beliefs and customs in this county are interesting, at least, to many. Dr. Alleyne Walter continues his examples of Irish plate. A two-handled cup of vase shape with repoussé work (1769), and a censer and ship for incense, preserved in St. Nicholas, Dublin, are illustrated. They are good examples of Irish silversmiths' work. A fine monstrance, bearing London hall marks 1693, is also engraved of elegant design in the stem and base. "Coningsby Hospital, Hereford," is described and illustrated by W. John Burns. "Notes on Folklore," and other articles appear.——*The Law Relating to Building*, third edition, by His Honour JUDGE EMDEN, assisted by HENRY JOHNSTON (London: Knight and Co., Fleet-street), is a new and remodelled edition of a book we have before reviewed, which has been found very helpful to the profession. Comparing the volume with the last edition, we find the work has been recast and condensed. The classification has been considerably altered if we look at the table of contents. In the old volume, Chapter II., on "What Building Leases and Agreements may be Made," was a very comprehensive chapter; the new edition condenses the whole under a few heads. The third chapter of the new edition treats of bills of quantities, specifications, tenders, and sureties; the next chapter on forms of contract, duty independently of contract, corporation contracts, divided contracts. The architect's duties and liabilities, advances to builders, time and penalties, property in building materials, extras, building covenants, easements, and other questions are fully discussed. The precedents of building leases and contracts, and the statute law relating to building are invaluable additions to Judge Emden's work. Equally useful are the notes of cases appended; the Acts regulating gas and water. The London Building Act is fully given amongst the other statutes, and the whole is well printed with marginal headings. As a general handbook of the law relating to building, the work is very complete.——*Archæologia Oxoniensis*, Part VI. (London: Henry Frowde, Amen-corner, E.C.), contains an article on "Phœnician Characters from Sumatra," which will be of interest to Oriental scholars. In another article a detailed account is given of the marble monument found in a wall during the restoration of Oxford Cathedral in 1875. The marble fragments found, it is conjectured, belonged to the shrine or the base that supported the shrine of St. Frideswide, known to have been erected in 1270 to take the place of the coffin in which her relics were deposited in 1180. The illustration of the carved spandrel shows a very beautiful adaptation of celandine. The fragments found were put together and placed in position with great care on the remains of the fragment of plinth, and measurements enabled a restoration of the monument to be made, from which it was found that the monument comprised two trefoiled arches, each 3ft. in diameter, with a single arch at each end. The total height was 6ft., and the total length 7ft., and width of monument 3ft. 6in. The particulars of other researches are of interest. Another contribution is on the architecture of the Bodleian Library and the Old Schools.——*Statically Indeterminate Structures*, by HAROLD MEDWAY MARTIN, Wh. Sc. (London: Offices of *Engineering*, Bedford-street, Strand), is a reprint from the pages of *Engineering*. The author applies the "principle of least work" to determining the stresses in structures with superfluous parts. Very few writers have considered the subject of statically indeterminate structures, though for solid beams, trusses, arches, continuous girders, and stiffened suspension bridges the method of least work is very usefully applied to determine the stresses. The author deals with arches, and shows how the method can be applied to a semicircular arch by a simple process which determines the bending stresses on both sides of the arch unequally loaded. Two hinged arches are treated by reference to the Washington Bridge over the Harlem River, New York, the span of which is 510ft. between the hinges, and the rise 90ft., each rib is 13ft. deep, and is of I section. The various stresses acting on the rib are divided under three heads—that due to bending, that due to direct compression, and that due to shearing forces, and these are severally discussed. Rigid arches are next considered; also suspension bridges, continuous girders, and trough floors. The investigations are of interest to the engineer and mathematical student.——*Programme of the City and Guilds Technical Institution, Finsbury.* Session 1895-96.—This useful programme of day and evening classes of the Technical College, Finsbury, contains an almanac and all particulars as to the courses of instruction, arrangements of the session, fees, prizes, scholarships, &c. The courses of instruction on mechanical engineering, applied mathematics, applied physics, applied art, special trade classes are fully detailed.——*The Tallerman-Sheffield Patent Localised Hot-Air Bath* (London: Baillière, Tindall, and Cox, King William-street, Strand) is a pamphlet descriptive of this hot-air bath and its remarkable success in cases of rheumatic arthritis of long standing in gout and sprains. The system is a local application of super-heated dry air. The particulars of cases treated at St. Bartholomew's Hospital, North-West London Hospital, Charing Cross Hospital, St. Mary's Hospital, and other establishments are of interest. To those suffering from rheumatism in its many forms the pamphlet is worth perusal.——*Ceramics: National Art Library, South Kensington* (London: Eyre and Spottiswoode).—This is a classified catalogue of printed books on the subject of ceramics, and is the first of a new series, with the object of enabling every reader to ascertain with the least trouble what works the National Art Library contains on any particular branch of art. The order followed in subdivisions of each section is chronological, which is a useful feature. The catalogue is very comprehensive. It comprises works on the manufacture of bricks, tiles, and terracotta, stoneware, porcelain, and glazes; on style and ornament, architectural decoration, many of them well known and valuable. Oriental, Prehistoric, Antique Greek, Etruscan, and Old Latin, Roman, Early Christian and Byzantine, Mediæval, Renaissance, Modern, are classified, each section comprising treatises of every important country. Thus under the head of Modern we get Burmantofts, Doulton ware, and other books and illustrated catalogues. To all collectors and students of ceramics and the many allied industries this classed catalogue will be of much service.——*The Reliquary and Illustrated Archæologist*, New Series, Vol. I. (London: Bemrose and Sons, Ltd., Old Bailey), is a handsomely-bound volume of this quarterly journal and review, which is devoted to Early Pagan and Christian antiquities in Great Britain, ecclesiology, and other kindred subjects, edited by J. Romilly Allen, F.S.A. (Scot.) The plates and photo-process illustrations are excellent. The frontispiece is a monumental effigy in the south aisle of a church in Denbigh, said to have been transferred from the Cistercian abbey of Valle Crucis, and illustrates a paper by Stephen W. Williams, F.S.A. "Wall-Painting at Kirkby Hall," by H. Swainson Cowper, F.S.A., is the title of an interesting description of wall-paintings found in the chapel of an old manor-house, built about the 15th century, and added to in the time of Henry VIII. The chapel is in the last portion, and is 26ft. by 14ft., open to roof, and divided into two bays by a truss. The paintings are on the plastered walls. Photo illustrations are given of these singular paintings, which represent, in one of them, a tree trunk, from which peacock plumes spread—strange birds with tails. The other is similar in design, and beneath a dragon. Those interested in Transitional Norman and Early English will welcome Mr. Walter Brook's article on the existing remains of the Priory Church of the Holy Trinity, Micklegate, York. Illustrations of the very elegant piscina found in the excavations are given; this shows an octagonal basin with interlaced stems of capital-like form. The sketches given of the arches and pillars (octagonal) of one of the bays, triforium and other features are interesting examples of Early English of Transitional character. In the Illustrated Notes is an illustration of the Egyptian tomb on the Island of Elephantina, discovered by H.R.H. the Crown Princess of Sweden and Norway, also of the preaching cross at Leighton Buzzard, foundations of Roman Villa at Darenth. The papers, "On Deneholes," by Miller Christy, and the "Old Stone Crosses of Somersetshire," by Alex Gordon, are worth perusal. The latter include market and village crosses, churchyard crosses, wayside crosses, and memorial or boundary crosses. Good illustrations are given of the market crosses of Glastonbury, Cheddar, Taunton, and Dunster. An illustrated paper on the Church of Sta. Maria dei Miracoli, Venice, is also given, and several items of antiquarian interest. ——*Photography: Its Materials and Appliances* (London: John Birch and Co., Ltd., Queen-street-place, E.C.) is an illustrated manual and catalogue for circulation in the Colonies and foreign countries. The work is written for beginners in the art, and is intended to assist them over the first stumbling-blocks, and as an introduction to more advanced textbooks. Part I. contains descriptive articles on a variety of subjects, such as the choice of cameras and lenses, hints on lighting, on exposures, developers, printing processes, the platinotype process, enlarging, application of the art to architecture, &c. Dr. Cograve's article on the latter is worth attention, and several reproductions in photography of architectural examples are given. Speaking of that very difficult point, the light, it is advised, "Never take against the light. In the northern hemisphere, do the east end in the morning, the south side about noontide, and the west front towards evening." Many other suggestions are given. Part II. is an illustrated catalogue of photographic apparatus and appliances, each article being well illustrated and described with prices. Instructions, formulæ, and everything the amateur photographer wants are to be found in this comprehensive work of Messrs. Birch and Co.

* * *

At Perranzabuloe, West Cornwall, a new vicarage has just been built near the church, from plans by Mr. Silvanus Trevail, V.P.S.A., Truro.

The harbour works at Mullion, West Cornwall, are being commenced. Mr. Parkinson, the contractor, is getting all the necessary plant in readiness, and from thirty to forty men are already at work. The engineers have also arrived. This important undertaking will make Mullion rather lively for some time to come.

On Wednesday, December 4, the centenary of Carlyle's birth, a special loan collection of portraits, pictures, MSS., and other memorials will be opened at Carlyle's House, Cheyne-row, Chelsea, and will remain open for about a month. A meeting will be held at Chelsea Town-hall, King's-road, at five o'clock, when the keys and title-deeds of the house will be handed over by the committee to the trust. Mr. John Morley will preside, and Mr. Augustine Birrell, M.P., and others will also speak.

Mr. Rienzi Walton, one of the inspectors of the Local Government Board, held an inquiry on Friday at the town hall, Leigh, into the application of the Leigh Urban District Council for sanction to borrow £100,283 for purposes of public and private street improvements, and £26,464 for the execution of their improvement scheme and the erection of dwellings under the Housing of the Working Classes Act, and £5,904 for works of sewerage. Mr. J. H. Stephen, engineer to the council, stated that £60,705 was required for public street improvements, and £39,578 for private street improvements. The whole of the west side of Market-street, the chief street in Leigh, would be taken down in order to make the street, which was extremely narrow at present, 56ft. wide. The main streets, Chapel-street and Bradshaw-gate, would also be widened. Under the Housing of the Working Classes Act the Council proposed themselves to build 20 cottages, the cost being estimated at £5,147. The works of sewerage would cost £5,904.

With a view to the opening up for building purposes of various sites in the Edinburgh district of which the Heriot Trustees are the superiors, the feus of a number of building lots have been disposed of by auction. Ground at Wester Coates, fronting the new villa streets being opened up in that district, was sold at the rate of £50 per acre of feu-duty; six out of twenty-three building lots at Denham Green, Trinity, on which are to be erected two-story terrace houses, were sold at the upset of £5 feu-duty per lot, and four lots in Carson-street, Leith Walk, and intended for the erection of four-story flatted houses, were disposed of at the upset price of 10s. 6d. per foot of frontage feu-duty.

The Lord Chief Justice tried, on Friday, an action, "Alexander v. Fonnereau," in the Queen's Bench Division, in which an agent, Samuel Alexander, claimed £250 of William Neale Fonnereau, as the commission promised to him in the event of his finding a purchaser of the defendant's property, Christ Church-park, Ipswich. The jury found for the plaintiff, and judgment was given accordingly. In the course of his summing up the Lord Chief Justice made some strong remarks upon the practice of agents receiving commissions from both sides in a bargain.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—Mr. William Henman delivered his presidential address to the members of this association on Friday evening, the 15th inst. He observed that in several recent addresses that had been delivered in other parts of the country there had been shown a unity of feeling on matters architectural, spiced though they might be by a diversity of views on points of minor importance. If the influence of the R.I.B.A. was to be properly extended, much greater consideration must be given to the views of those whose lot it was to reside in the provinces; and if the roll of Fellows was to be largely increased from outside, it was chiefly from the provinces that the increase must come. The present scanty attendance of provincial members at the Council Board of the Institute was undoubtedly the cause of the neglect shown to the interests of non-Metropolitan members, and the question arose—Could not something be done to bring at least some of the large number of practising architects in Staffordshire, Shropshire, Warwickshire, Worcestershire, and Herefordshire within the ranks of the Institute? Although he was not prepared with a cut-and-dried scheme for bringing about an imperial federation of architects, he would suggest that the Institute should obtain the necessary powers to enable architects with the required qualifications to be admitted to the class of Fellows without having to undergo the form of election at present essential. A few newly-fledged Fellows and Associates blackballed provincial men, and even their respected past-president, Mr. Jethro A. Cossins, had been declined admission, while others were elected whose sole merit was that they had slipped into the Associateship before examinations were compulsory. He did not agree with Mr. Penrose in advocating the total abolition of competitions, for his own experience had been that by competition his energies were excited, and he exerted himself by study and observance, not only to secure success, but to be capable of undertaking work when success came. If competitions were abolished, a greater evil to architecture—monopoly—would reign. The competitions recently organised by the Birmingham Corporation, although not all that could be desired, had resulted in the erection of one public building of which the city had reason to be proud—namely, the Technical School; and another was in course of erection—namely, the Meat Market, which it was hoped might be equally successful; and a more liberal distribution of the work executed for the Birmingham School Board would tend to improve architectural treatment and arrangement of school buildings, and probably result in more reasonable economy of construction.

* * *

After a controversy extending over four years, the Urban District Council of Penrith has in committee carried a scheme for a new water supply to the town which is expected to cost over £20,000. The scheme adopted is one of gravitation from Melmerby.

Mr. G. W. Willocks, one of the inspectors of the Local Government Board, held an adjourned inquiry on the 14th inst. at Bacup, relative to an application by the corporation for sanction to borrow £14,009 for the erection of new municipal buildings, £1,600 for new fire-station and appliances, and £770 for caretaker's house and refreshment-room at the Maden Recreation Grounds. Strenuous opposition was offered to the item of £14,000 by members of the council and the public, the chief ground of opposition being that urgent work in the shape of water supply and sewering ought to be undertaken before spending such a large amount on ornamental buildings. Councillor B. Smith estimated the sum that would be required to be spent on drainage at £70,000, but the surveyor only estimated it at £10,000. Mr. Diggle, the engineer called in by the waterworks committee to consult as to the present and future supply of the borough, estimated that £50,000 would supply the town with adequate water supply for many years to come.

A memorial to the late Bishop of Colchester, who died on Nov. 5, 1894, is being erected in the north transept of the cathedral at St. Alban's. The monument is of stone, and representations of the Four Evangelists will be placed in niches in the front, and carved panels will be fixed between them. On the top, a cross of black marble will be affixed, and the inscription upon the memorial will be as follows: "In loving memory of Alfred Blomfield, D.D., Bishop of Colchester, first suffragan of St. Alban's; born August 31st, 1833; died November 5th, 1894." Mr. Thomas Nicholls, of Kennington, S.E., has the work in hand.

COMPETITIONS.

East Riding Asylum Extension.—The committee of the East Riding Asylum, at a meeting on Monday, unanimously adopted the report of the professional referee, Mr. G. T. Hine, 35, Parliament-street, Westminster, S.W., awarding the premiums as follows:—1st, £50, to design under motto "Ebor," Mr. C. H. Hebblewaite, Hopwood Hall, Halifax; 2nd, £25, "Star," Messrs. Crisp, Otley, and Skinner, Bristol; 3rd, £10, "Labour Omnia Vincit," Mr. H. Harper, Market-street, Nottingham. Twenty sets of plans were submitted in competition by seventeen architects, and were described by the referee as, on the whole, very creditable, and as having shown that much care and consideration had been given in their preparation.

Minneapolis. — The competition for the Minnesota State Capitol has been decided in favour of Mr. Cass Gilbert, of St. Paul; Mr. George R. Mann, of St. Louis, being placed second; Messrs. E. P. Bassford, of St. Paul, and Traphagen and Fitzpatrick, of Duluth, third; Mr. Clarence H. Johnston, of St. Paul, fourth, and Mr. Harry W. Jones, of Minneapolis, fifth. Mr. E. M. Wheelwright, of Boston, was the expert adviser of the Commission, and his recommendations seem to have been, in the main, followed.

CHIPS.

Fairly good business was done last week at the auction mart in Tokenhouse-yard, the aggregate being £62,240.

As Lord Warden of the Cinque Ports, the Marquess of Salisbury has been invited to formally open the new Municipal School of Science, Art, and Technology at Dover.

A lecture was delivered on Tuesday evening at Liverpool University by Professor F. M. Simpsom, who holds the Roscoe chair of art in Liverpool University College, his subject being "Old Architecture in Liverpool."

At a meeting of the Council of Ministers at Cairo on Friday, the Khedive presiding, the proposals of Mr. W. E. Garstin, C.M.G., Under Secretary of State to the Ministry of Public Works, for the execution of the Geological Survey of Egypt, were sanctioned. The survey, which will be carried out under the direction of Captain Lyons, R.E., will cost £24,000, and is expected to give important results.

The Slade Professor of Fine Art at Oxford University (Mr. H. Ellis Wooldridge) will deliver two lectures in the lecture theatre of the University Museum, on Wednesday next and the following Wednesday, at 4 p.m. each day. Subject: "The Theoretical Basis of Art." Part I., "The Greek Theory"; Part II., "The Modern or Hegelian Theory."

The opening meeting of the Architectural Section of the Glasgow Philosophical Society was held on Monday night, when the president, Mr. T. L. Watson, F.R.I.B.A., delivered an address on "Glasgow Cathedral: a Contribution to the History of the Structure." He put forward evidence to show that the building had not been constructed at one period, but that there were traces in the choir which showed that some of the work was two centuries apart.

The Court of Appeal gave judgment on Tuesday in the action brought by Messrs. Clutton, the well-known surveyors and estate agents of Whitehall, to make Messrs. George Attenborough and Son liable for £3,558, the proceeds of forged cheques they had cashed for a former clerk in the employ of the plaintiffs. Mr. Justice Wills had decided in favour of the defendants, and his decision was now upheld by the Master of the Rolls and Lords Justices Lopes and Kay.

The memorial to the Rev. P. Bowden Smith, for forty-three years a master in Rugby School, will take the form, should funds permit, of a reconstruction of the western portion of the college chapel.

The district council of St. Germains have just completed the construction of a reservoir at Milbrook. Mr. H. Masterton, C.E., was the engineer, and Mr. Weldon the contractor.

The death has occurred, at his residence, Newport, of ex-Bailie James Thomson, Dundee. Deceased, who was a native of Auchterarder, carried on a successful business in Dundee as an architect until twenty years ago, when he retired. In 1876 he was elected a member of the town council, and he held a seat on that board for six years, during a portion of which time he acted as a magistrate. He also took a keen interest in Newport affairs, and was elected a member of the first Burgh Commission.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—S. B. and Co.—Essayist.—F. Wilkinson.—E. J. S. (Bath).—Cestus.—F. W. L. and Co.

"BUILDING NEWS" DESIGNING CLUB.

LA CIGALE, ONCE MORE, AND OTHERS. (The particulars as to the swimming-bath being used as a hall for meetings are perfectly clear. Of course, the swimming-pond would have a floor over it when the building is used as a public hall.)

DRAWINGS RECEIVED. — "Ovolo," "Queen Anne," "Ilex," "Kaffir," "Mac," "Once More," "Dunelm," "Venus," "E," "Balbus," "Taffy," "Snap-shot," "Leemo," "Monster," "The Owl," "Drawde," "Tyke," "Shafston," "Twitty," "Avis," "M in a circle," "Mandalay," "Dessinateur," "Country Cousin," "Cester," "Red Lion," "Worcester," "Cygnette," "Valhalla," "Demetrius," "Veller," "Giles," "Rex," "Bloggs." An addressed label without a drawing attached to it also came to hand, marked "Found in Bedford-street Post-office," but with no marks by which any identification as to its sender could be obtained.

Correspondence.

PROPOSED NATIONAL AND PROVINCIAL UNION OF BRITISH ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—In common, no doubt, with many more, I have been interested in Mr. George Ord's letter in your last issue, and, if such a society as he suggests can be established, I will gladly send to it my annual crown or so. At the same time, I fear the evils which it is desired to check are unlikely to be cured by any available means. The only plan I can think of as probably effective would be the establishment of a wise and resolute professional dictator, aided by a strong assassination committee! The mischief is too deeply rooted within us for milder treatment to avail. After more than a quarter of a century of experience of the works and ways of architects in many parts of the country, I am compelled to own that I know almost no calling, save that of jockey, for the members of which, as a body, I have less respect (I refer, of course, to the common rout, not to the exceptions here and there). Pretentious and trumpery design, devoid of all principle and thought, stinted and scamped working drawings and specifications, ignorance and unscrupulousness in regard to quantities and other matters bearing on cost, are characteristic of many more than a bare majority, and are of one piece of moral stuff with the suicidal stupidity which makes so many eager to advertise the want of value in their work by offering it for an off-chance of payment which the dullest despised tradesman or craftsman would reject with contempt. It is very curious to consider how wholly ignorant the general public are of all that belongs to the art and duty of the architect—how foolish all their talk about it and him invariably is!—and yet how thoroughly the average architect deserves the low estimate which the general public forms of his value;—deserves it in many ways, but perhaps most of all by his eagerness to pander and truckle to the meanest and most ignoble propensities of said public. Such as we are, no association can help us much. Nor, I fear, can any Act of Parliament, by incorporation or otherwise. Lawyers, we know, are all honourable men; judges have indignantly asserted it from the Bench, and *they* are incorporated long since; yet going to law is not a profitable business to clients, whatever it may be to lawyers. And any similar "improvement of the position of architects," which consisted of raising our wages without mending our work would not, to my thinking, be much worth fighting for. Still, if we begin by resolving that the public shall not wrong us, nor by our aid wrong our rivals, we may end by resolving further that we will not wrong ourselves nor the public—that as workmen we will not only have fair wages, but earn them; and on the chance that something may result towards producing at least the former resolve on a wider scale than now obtains, I wish Mr. Ord may meet with extensive support.—I am, &c.,

ONE IN A MOB.

SIR,—Many of us must have been highly pleased to see such a sensible and powerful letter upon this all-important subject in last week's BUILDING NEWS, the suggestions of which were so eminently practicable.

It is curious that, with all its crying abuses, the architectural profession should remain, with respect to its general and personal interest, in a state of utter apathy. The fact of the matter is that we have all been so entirely taken up with what we falsely considered our own good, that we have really neglected it and the welfare of the whole architectural community. Going helter-skelter, everyone for himself, we would have, and let, the devil take the hindmost, only that gentleman, not satisfied with this, goes for the lot.

We all know what happens to the house divided against itself, and we are now experiencing that catastrophe. Where is there another important body that so sadly lacks organisation, or an unimportant one which is not doing its best to join forces? Do we want protection from the pseudo-architect, the competition fiend, justice in legal administration, adequate remuneration for public exaction?

Judging from our present attitude of indifference, we answer: No. We prefer to scheme and worry over our clients' plans, take the responsibility after spokeshaving our quantities, fritter away our time on competitions, and be begrudged our paltry remuneration. And as for honour and glory, no one thinks any the better of us, and we become a by-word. If anything's wrong, "It's the architect."

All this might be more bearable if there were any hope of redress; but, alas! at present there is none. If we don't want to alter this, we shall remain in our present state of lethargy—leave it to others to put right, or be content with the "Institute" and the "Societies." These have done and are doing good work; but it always seems to me that they have begun at the wrong end: they attend to the flower of the profession, but neglect the roots, forgetting that the lowlier parts well tended will benefit the bloom.

If we are to look to legislation for help, we must have power; and to have power, we must have numbers. In short, we must have union. If the limited federation projected some years ago had been extended to the entire profession as it then stood, and all these years which have fruitlessly fled had been given to organisation of the whole, what a splendid position we should have now occupied—what power ours would have been!

Everything human must have a beginning, and the poorest is potential. Let us unite to assert and defend our just rights.

Mr. Geo. Ord, of Durham, asks for the names of all in sympathy with the movement to be sent to him, and I hope that the number will be so great that the matter cannot but immediately proceed. Thanking you, Mr. Editor, in anticipation—I am, &c.,

W. F. S.

PROPOSED ASSOCIATION OF WATER-WORKS ENGINEERS.

SIR,—We are again reminded that "there is no institution wholly given up to water engineering questions in England, although such questions are occasionally treated of by the Institution of Civil Engineers." That is, I am led to understand, the opinion of many engineers, managers, and others interested in waterworks undertakings. The exceptional and severe winter of 1894-5 itself was a subject-lesson to those interested in waterworks. The controversy between the use of two-gallon and three-gallon cisterns for w.c. purposes, the question of employment of registered plumbers only for waterworks purposes, the better control of fittings for the prevention of waste, misuse, and the contamination of public supplies are points, amongst others, which might usefully engage the attention and call for combined action from those engaged in this important branch of engineering.

My object in writing is to initiate a discussion from those interested, with a view of ascertaining what support is likely to be given to such an association.—I am, &c.,

D. M. F. GASKIN, Engineer.

THE "SCIENTIA" WATER-CLOSET APPARATUS.

SIR,—In reply to the letter of "A London Architect," which appeared in the BUILDING NEWS, Nov. 8th, and to the many others who have written to us directly, we may say that when there is a window behind the apparatus the woodwork will be terminated at the height of the top of the urinal stage, and the shaft carried in a side direction, the design being altered to suit the position.

As regards a series of closets one over the other, there is no difficulty whatever, for when the current is taken through the outside wall it may be left there, or, if thought better, it may be connected into a pipe ventilating to the top of the house, and common to all the closets.

The whole apparatus is extremely simple. The closet seat is on strong spring hinges, and so is the door, which closes in the urinal and tap chamber, the seat rising automatically on being relieved of weight, thus permitting of the urinal door being freely opened or closed, so that everything works independently of any neglect the apparatus may be subjected to. Behind the door there is a free space passing upwards from the w.c. basin in front of the curved urinal slab, and through the tap chamber into the ventilating shaft. When the door is opened the urinal is flushed, and continues to be flushed until it has run the quantity of water allotted to each flush. If it is desired to use the water cocks, the door is fixed in an open position, and the method of fixing puts a termination to the flushing of the urinal, so that water is not unnecessarily wasted.

Your correspondent very aptly says that the air from the w.c. window serves but to dilute the odours of the closet, and drive them into every nook of the house. Our houses, we should bear in mind, are but huge "suction-pumps," through which the air is constantly being drawn, and as we *must* have a supply of air from some source, we should see that the odours of the closet do not form any part of such supply. The arrangement of the "Scientia" is such that the direction of the air is *from the house to the closet*, and not, as in other closets, from the w.c. to the house.

We will be pleased to give your readers any further information about an apparatus which we are prepared to say will work satisfactorily in any conceivable position.—We are, &c.,

BURGH CABINET WORKS CO.

Easter-road, Edinburgh.

◆

Messrs. John Barker and Co., Ltd., are rebuilding a large portion of their premises butting on to Ball-street. Mr. F. G. Vigor has prepared the drawings, and the company are carrying out all the work with their own staff, with the exception of the fireproof floors, which are being constructed by Messrs. Mark Fawcett and Co. on the Mark Fawcett system.

Intercommunication.

QUESTIONS.

[11452.]—**Colour on Parchment.**—Is it possible to get colour to lie as nicely on parchment as on drawing-paper, and how should it be put on? Is there anything to put on the parchment to prevent it going through, as it will on some skins? A learned solicitor (?) says I should put acid in the colour.—James S. Fitzpatrick.

[11453.]—**Prices, &c.**—(1) Will any reader kindly give names, qualities, appearance, position in which used, and prices, laid in mortar per yard of bricks commonly used in London? (2) If any quantity surveyors depart from standard, and give 1 brick thick yards instead of 1½ brick thick rods? (3) If, instead of giving timber cubed, they give it in quantities as super. and lineal? (4) If such innovation would inconvenience or be objected to by contractors tendering?—Provincial.

[11454.]—**Skittle Alley.**—Will any reader kindly say what is the general length and width for skittle alley? Also the best method of laying the floor?—Skittles.

[11455.]—**Lime in Water.**—I should be obliged if any reader would tell me, or refer me to a book, stating at what temperature the lime contained in the ordinary drinking water precipitates, and commences to coat the interior of the vessel in which it may be heated with the hard substance commonly known as "fur"?—W. W. R.

[11456.]—**Extras.**—What are the correct architectural charges to make (1) on contract and extras, also deductions; (2) on contract and extras only; (3) on contract and extras, after deducting bill of deductions?—J. W. C.

REPLIES.

[11445.]—**Ivy on Walls.**—The conflicting statements heard by "Oberon" as to the effects of ivy on stone and brick walls in keeping them dry and wet are both right. If ivy-covered walls are somewhat protected from driving rain, no doubt it acts as a kind of thatch; but, on the other hand, if ivy-covered walls are exposed to the force of winter's storms, where the rain is driven by the wind right through the ivy into the wall, then, no doubt, the wall is liable to be almost permanently damp, as the ivy excludes the sun and air, which are required to bring it out again. Ivy is not able to weaken or destroy a well-built wall, but be sure to keep it away from jerry-builders' mortar.—H. Preston.

[11450.]—**Concrete Floors.**—I prefer to use broken brick (in pieces not more than 1in. any way), mixed with enough fine, but dust-free, coke breeze to fill up the interstices. Sand is too heavy, and the particles are commonly too smooth, and make brittle work. For the same reason, only more so, gravel and ballast are fatal. Coke breeze without brick is (in most urban localities) cheaper, and it is also lighter, but not so strong—does very well for ordinary house-floors. I have put up extensive floors of each kind, the iron consisting of light flat bars set on edge, and having their ends threaded with ¾in. continuous rods, lying 4½in. on the walls, and built into them in cement courses. But best of all, I believe, is the plan (common in America, but only lately introduced here) of using small, square cold-twisted bars. They should have three or four turns per foot, bear a few inches on the walls at ends, and lie an inch above the soffit of the concrete. Half-inch square bars are large enough for spans up to 16ft., the distance between being reduced as the span increases. For 10ft. spans the intervals should be 9in., and the thickness of concrete 5in.; for 12ft. spans, 7in. intervals and 6in. concrete; for 14ft. spans, 6in. intervals and 7½in. concrete; for 16ft. spans, 5in. intervals and 8½in. concrete. The cold-twisting not only prevents the bars from drawing, and so renders keying the ends needless, but also actually increases the tensile strength of the metal. The use of "joists" in concrete is a very crude, unscientific, not to say senseless, method, both extravagant and ineffective, and has done more than anything to hinder the use of concrete floors and roofs, which ought long since to have become universal. They will do so whenever architects begin to study sound and sensible building, and to base their style on that, instead seeking first after superficial gewgaw effects, which result in houses that look—and are—as trumpery as birdcages, whereas they should appear—and be—as solid and stable as rocks.—W. S.

[11451.]—**Dry-Rot.**—In answer to "Dry Rot," if "Grange-over-Sands" had been experimentally seeking a method of setting up dry-rot (so called) to his basement floors, he could not possibly have adopted any method more uniquely successful. His broken stone, coke breeze, and cement, are all absorbent materials. Instead of repelling the dampness, as so many people (who ought to know better) suppose, they greatly encourage it. The capillary action of the material has a tendency to suck up every drop of moisture from the earth, and bring it to the surface, almost as readily as a knob of sugar takes in the moisture from the dregs of a cup of tea. "Grange-over-Sands" should have put down a cheap wood-block floor in pitch, not forgetting to pitch the edge of the blocks where they come next to walls, or, if he would rather prefer boards, he should have pitched the concrete all over on the surface, setting a few iron bolts in the concrete previous for fixing bonds.—H. Preston.

◆

Two miles south-west of Totnes, in the hamlet of Luscombe and parish of Harberton, at the junction of four roads and situated on the highest ground in the manor of Dundridge, are the 15th-century remains of a wayside cross. Only the base and part of the upright pillar remain to testify to what was once there. These are hewn out of grey granite from Dartmoor. Under the direction of Mr. W. M. Tollit, architect, of Totnes, the missing portions have now been made good. The new work is also of Dartmoor granite, and on the top of the shaft is a circular head carved in facsimile of the famous cross at St. Columb Major. The restoration has been carried out by Messrs. Harry Hems and Sons, of Exeter.

Legal.

CONTRACTS AND COMMITTEES.

BUILDERS who make contracts with corporations should always take care to have this done in writing and under seal, for in no other way can they get a valid and enforcible contract, if objection is taken to its legality. Yet although this is so, and is well known to those whom it concerns, we do occasionally come across a case in which a merely verbal promise, and that, too, by a committee of a corporation, has been enforced. This occurred quite recently in an action against the Huddersfield Corporation, which went to the Court of Appeal (*Times*, Nov. 13), and which was reported in our last issue of Nov. 15. The plaintiffs had been employed to do certain sewerage works under the corporation, and in course of construction it was found necessary to tunnel through a mass of rock, which the plaintiffs considered should be treated as extras. The borough surveyor, however, refused to do this on his own authority, and referred plaintiffs to the Health Committee; and this body gave them a verbal promise that they should receive proper remuneration for the work in question. At the trial plaintiffs relied, firstly, upon an alleged certificate of the surveyor, on which they failed; and, secondly, upon the parole contract made by the Health Committee on behalf of the Corporation, upon which point the jury gave them a verdict. After this, the defendant's counsel objected, firstly, that the contract relied upon was not under seal, and therefore not binding; and, in the next place, that by Section 200 of the Public Health Act, 1875, such a committee could not enter into a contract of this kind so as to bind the Corporation. Mr. Justice Mathew, however, refused to entertain these points, because they were not taken until after the verdict, instead of being raised before.

Upon appeal, it was argued for the corporation that they were entitled to judgment, notwithstanding the verdict, on the ground that the contract, not being under seal, was legally void, and so could not support a judgment. But the Court held that it was now too late to raise that objection. By allowing the case to go to the jury upon the one point of fact, whether or not the promise was given by the committee, the corporation had waived the objection they should have taken before. It was the same thing as if they had fought the case upon the ground that no certificate had been given, and had afterwards sought to object that the original contract was void for want of a seal. The corporation had no merits to go upon, and now they must pay in accordance with this very informal promise of their committee.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Six-inch.—Lessees.—Drains.—A., having only an ordinary three years' agreement, would not be liable to contribute to cost of repairing drains; but probably his landlord holds under a similar lease to that of adjoining lessees, and if so, he could be made responsible.

Puzzled.—Lease.—Covenants to Repair.—This seems an unusual form of lease. But, at all events, the separate covenants to paint within specified times would, I should say, be enforcible, apart from the covenant as to general repairs.

◆

Parliamentary notice has been published for the projected light railway from Forsinnard to Portskerra, on the north coast of Sutherland. The Duke of Sutherland is proprietor of all the land through which the line passes, and in addition to a free grant of the land, he has promised all the wood for the sleepers. All the crofters and other tenants of the land have signed agreements in favour of the construction of the railway, so that the scheme, which is estimated to cost £40,000, is quite unopposed.

The new Workhouse Infirmary, Guildford, is now being erected for the guardians of the poor of the Guildford Union, from the designs and under the superintendence of Messrs. Peak and Lunn, architects, of Guildford. All the wards are being warmed and ventilated by means of Shorland's patent open fireplace Manchester stoves, with ornamental tiled sides, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

LEGAL INTELLIGENCE.

What is a Main Road?—In re an Arbitration between the Mayor of Burslem and the County Council of Staffordshire.—In the Court of Appeal, on Monday, before the Master of the Rolls and Lords Justices Kay and Rigby, an appeal was heard from an order of Mr. Justice Grantham and Mr. Justice Wright, which was against the Staffordshire County Council. The Council objected to contribute to the repair and maintenance of certain paved ways on main roads passing through districts in the county. By the Local Government Act, 1888, these roads were to be wholly maintained by the County Council, but the District Council might claim to repair them, subject to the County Council contributing an annual sum to be arrived at by arbitration. The arbitration took place, and the County Council sought to set aside the award on the ground that they were not liable for the repair of the paved footpaths, but the Divisional Court decided against this contention. Hence the present appeal. The Master of the Rolls, in giving judgment, said the question in dispute was: What was a main road? It was one leading from one large town to another, like the Great West of England-road, or the great North-road, some parts of which, passing through towns or villages, might have pavements on each side for the convenience of pedestrians. The County Council objected to pay for these pavements; but, in his opinion, they formed part of the main road, and came within the words of the Act. He entirely concurred in the previous decision on the point, and the appeal would be dismissed. The other Lords Justices concurred. The appeal was accordingly dismissed. It was intimated there would be an appeal to the House of Lords.

Light and Air Case at Plymouth.—Before his Honour Judge Edge, at Stonehouse, on Nov. 12 and 13, Richard Pearse, owner of a house at 11, Prospect-place, Plymouth, claimed £50 damages from William Lapthorn, contractor, Plymouth, for erecting a workshop upon a wall alleged to belong solely to plaintiff, and thus causing an obstruction to light and air. Plaintiff also asked for an injunction to restrain defendant from continuing the trespass and obstruction. The wall was claimed to be plaintiff's on the ground that his father had always executed all necessary repairs to it, and no one else. Defendant had erected a workshop of corrugated iron and wood on the wall, with the result that necessary air and light to plaintiff's premises were seriously interfered with. Messrs. A. W. Dobnam, E. M. Leest, and H. G. Luff (architects and surveyors), and plaintiff bore out counsel's statement, and the tenants spoke of the baneful effect upon the light and air in the rooms and courtyard. For the defence Mr. Pearce called Mr. A. Corderoy, M.S.A., who gave his reasons for considering the wall a party-wall. With regard to air, there were 248 superficial feet of air in the courtyard before defendant put up his building. There were now 172 superficial feet of air; amply sufficient, the usual expert allowance being a half a foot for every superficial foot of curtilage. The erection had rather increased than decreased the current of air, on the mine principle that a higher funnel increased draught. After viewing the premises, his Honour reserved judgment for a month.

Riparian Property.—In the Chancery Division, on Friday, Mr. Justice Romer declared in favour of the plaintiff in the curious trespass action of "Hindson v. Ashby." The parties are owners of adjoining riparian properties in Buckinghamshire, and the question at issue between them was whether a strip of land which the water had gradually ceased to cover, and upon which the defendant had made a concrete path for the use of his tenants, belonged to the plaintiff or formed part of the original bed of the river. Mr. Justice Romer decided that, as the river receded, the portion of its former bed which was left dry became the property of the owner of the land adjacent to it.

The Height of Corner Buildings.—At West London Police-court on Friday, a fresh summons against Mr. R. J. Worley was heard at the instance of the London County Council, in respect of Kensington-court, which continued beyond the regulated height. Mr. Chilvers, on behalf of the Council, said on the last occasion Mr. Poole, who represented the defendant, complained of the frequency of the proceedings. Mr. Chilvers brought the matter under the notice of the Building Acts Committee, and Mr. Poole and he had come to an agreement that if the magistrate would inflict the full penalty for a certain number of days he (Mr. Chilvers) would give an undertaking not to take any further proceedings. The committee, taking into consideration the fines inflicted by Mr. Curtis Bennett and the magistrate (Mr. Rose), and the costs which had been paid by the defendant, thought that would meet the requirements of the case. Mr. Rose, who could not agree to that arrangement, suggested that the case should be proved. Mr. Poole then pleaded guilty, for the purposes of the summons, and said the defendant was quite willing to adopt the arrangement of the committee. Mr. Chilvers pressed for penalties for fifty days at 40s. a day. Mr. Rose then ordered the defendant to pay £100, with 2s. costs.

CHIPS.

Wreight's Charity School at Faversham is about to be extended by the addition of technical classrooms. Mr. E. Power is the architect, and Mr. Walter Histed, of Faversham, the contractor.

The old church of St. Peter's, Derby, is to be improved and enlarged. The work will include the repairing of the nave, roof, and north aisle, the rebuilding of the tower, and the addition of two bays to the nave and aisle, westward. The work is expected to cost about £5,000.

A new Baptist School-chapel will be opened at Chesham on Tuesday, Dec. 3, by the President of the Baptist Union. It has been built by Messrs. Thompson and Brierley, at a cost of £3,000.

At Monday's meeting of the School Board for Newcastle-on-Tyne, a debate and division took place on the appointment of an architect or firm of architects for the proposed school in Elswick-road. The vote resulted in Messrs. Dunn and Hansom receiving the appointment on the usual terms and conditions.

The Heckmondwike Urban Council decided on Monday to apply to the Local Government Board for sanction to borrow £15,323 for sewage farm expenses, street paving, and other public improvements.

At Aby, near Alford, a new Wesleyan Chapel was opened last week. It is Gothic in style, and is built of Mablethorpe red bricks, with Ancaster stone dressings, and is seated for 150 persons. The cost of the chapel and schoolroom has been £700. The architect is Mr. John Thompson, of Grimolby, and the work has been carried out by Mr. Askew Wood, of Alford.

A Local Government Board inquiry was held at Torquay on Friday, touching the application of the Town Council for leave to borrow £4,500 for extending the water-supply. Mr. T. S. Weeks, waterworks engineer, explained the plans. There was no opposition.

Mr. D. W. Powell, of Kingswood, Bristol, who was, at a recent meeting of the Swindon and Highworth Rural District Council, selected as surveyor and inspector of nuisances, at a salary of £160 a year, in the place of Mr. C. Law-Green, resigned, has decided not to accept the position.

A new Wesleyan Church at Alphington was opened on Saturday. Mr. Herbert, of Exeter, was the builder, and Mr. Frank Chorley prepared the designs.

New Wesleyan schools are about to be formally opened at Mawdesley, near Ormskirk. Land adjoining has also been secured as a site for a chapel. The main school will accommodate 60 children, and the infant schools 24, the rooms being separated by a patent swivel partition. The structure is faced outside with pitched face stones, the inside lining being of brick. The works will cost about £500. The whole has been designed and erected under the superintendence of Mr. H. E. Peach, architect, Southport.

At the last meeting of the Torquay Town Council it was reported that the new promenade pier had been completed, and that the total cost had been £10,500. Mr. A. Thorpe was the contractor.

The *Quarry* is the name of a new monthy journal which is shortly to appear as a medium of communication between the stone, slate, marble, lime, and cement trades and those who supply their needs. It will be conducted under the same auspices as the *British Clayworker*, and will, no doubt, prove as successful. Mr. Montgomery has always struck out new ground, and not wasted his efforts on producing imitations of already existing journals, as some good people seem fond of wasting their own—or other people's—money in doing!

One of the finest freehold building sites in Westminster is to be offered at the Mart on the 4th of next month, by Messrs. Edmund Richardson and Son, of 50, Finsbury-square. It comprises Nos. 15, 16, and 17, St. Ann's-street, and 34 and 35, Old Pye-street, Victoria-street, and is only a few yards from the Westminster Palace Hotel. The superficial area is about 4,400ft., and early possession of the whole can be had.

The Local Government Board inquiry into the application of the Wimbledon Urban District Council for sanction to borrow £32,000 for purposes of electric lighting took place at the district council offices on Friday, before Major-General Phipps Carey, R.E.

An oak eagle lectern has been placed in the parish church of St. Petrock, Trevalga. It has been executed by Messrs. Harry Hems and Sons, of Exeter.

WATER SUPPLY AND SANITARY MATTERS.

ALTON.—A Local Government Board inquiry was held at Alton, Hants, on the 19th inst., by Col. Coke, M.Inst.C.E., for the purpose of considering an application from the Urban District Council for a loan of about £11,000 for sewage disposal works, the plans of which had been prepared by Messrs. R. B. Grantham and Son, Northumberland-avenue. The inspector first examined the land up to and upon which the sewage was to be pumped and distributed, and then held the inquiry. There was a good deal of opposition to the application.

NEWPORT, MON.—The scheme of the Newport Corporation to obtain a supply of water from Wentwood has been most unfortunate. The report of the two geological experts, Messrs. Hill and Hawkesley, C.E., upon the site just presented to the committee, recommends the abandonment of the scheme. The amount of the contract was £92,000, but the committee were recently given powers to borrow as much as £250,000. If the works are abandoned, the contractor, Mr. Young, of Glasgow, will probably have to be compensated for loss of contract.

◆

Messrs. Wm. Godwin and Son, Lugwardine Works, Withington, Hereford, have recently supplied the tile pavements in the chancels of the following churches:—St. Mark's, Reigate; Tong-street, Bradford; St. Cuthbert's, Clungunford; Brent Knoll, Somerset; and St. Michael's, Garway.

Mr. E. Roscoe Mullins, sculptor, has been commissioned to execute, in Bath stone, the large group of sculpture representing "Engineering," to be placed on the central gable of the new Bombay, Baroda, and Central India Railway Administrative Offices, Bombay, now being erected from the designs of Mr. F. W. Stevens, C.I.E., F.R.I.B.A., of Bombay. Mr. Mullins has also received instructions to execute two large medallion heads of the late Colonels French and Kennedy, the pioneers of this railway, which will be placed in circular panels over the exterior arches of the principal carriage-porch of the railway.

In referring to the outcry that has been made against the repairs recently executed at Rochester Castle, the *South Eastern Gazette* reports: "The cheapest way of repairing old walls was that adopted by the late Lord Romney at Allington Castle. When the stones got loose there, a couple of men were sent round with crowbars, with which they prised the loose stones into the moat."

Mr. Geo. W. Willcocks, M.Inst. C.E., a Local Government Board inspector, attended at the district council offices, Milnrow, on Wednesday week, for the purpose of making inquiry into the application of the council to borrow £16,000 for sewage works and sewage disposal.

In the erection of extensive residential flats near Child's Hill Station, Hendon, for Mr. G. F. Kalber, Messrs. Fambrini and Daniels, architectural concrete workers, Lincoln, have secured the contract for supplying the whole of the moulded sills and heads, stringcourses, cornices, caps, label moulds, elliptic arch moulds, &c., in their grey concrete masonry. This firm have recently appointed Messrs. Butson and Roberts, 67, Chancery-lane, as their town agents, where can be seen full-sized sections of mouldings, &c., as actually used in many public buildings.

In last Friday's issue of the BUILDING NEWS there appeared a notice of the competition for Bangor County Schools for girls, and in it Mr. J. H. Phillips, M.S.A., was referred to as the author of the designs placed first in the Tate Intermediate School competition. Mr. Phillips writes us that at that time Mr. J. T. Holdgate, now of London, was in partnership with him, and they were jointly the authors of the design placed first.

The Ramsey Town Commissioners (Isle of Man) have decided to erect a hospital for infectious diseases at Cronk Ruagh, distant about one and a half mile from the town of Ramsey. The site is admirably adapted for the purpose, and comprises about two and a half acres of ground. The hospital will contain 14 beds, and provision for administration, laundry, and disinfecting purposes. A caretaker's lodge will also be erected at the entrance gate. The total cost, including the site, buildings, furnishing, disinfecting apparatus, water supply, and drainage, is not expected to be over £4,000. The hospital has been designed by Mr. John T. Boyde, architect, of Ramsey, whose plans were selected in competition about two years ago. One-third of the cost will be defrayed by the Government of the Isle of Man.

The funeral took place on Monday, at Smithdown-road Cemetery, Liverpool, of Mr. George Morton, who, like his father before him, was a noted builder of houses in the south-end of Liverpool. "A genial and large-hearted man, Mr. Morton's life was," says a local journal, "full of acts of charity."

Our Office Table.

THE fourteenth annual fine art exhibition opened at Dundee on Saturday is one of the best of the series, and affords an excellent representation of contemporary Scottish art. Among the local exhibits are "A Rainy Day," by G. F. Watts; Sir F. Leighton's "Greek Girls playing at Ball"; Whistler's portrait of Carlyle, lent by the Glasgow Corporation; W. Q. Orchardson's "Napoleon at St. Helena" and "George Wishart." The seascapes include works by Colin Hunter, Hugh Cameron, Napier Hemy, and David Muirhead: the landscapes, works by Peter Graham, J. McWhirter, A. J. Kirkpatrick, A. Maure, Wellwood Rastrick, and J. McTaggart; Stacy Marks, J. R. Reid, and Thorburn Ross contribute *genre* works, and Professor Herkomer, as usual, is the foremost exhibitor of portraits.

IT has been stated that, with the decline of public interest in Gothic work, the practice of making rubbings of ancient memorial brasses has diminished in popularity. The process of getting a rubbing is a slow and dusty one, and, when obtained, a collection of facsimiles needs much space. It seems, however, that the Oxford University Brass Rubbing Society is in a flourishing condition. The "O.U.B.R.S." has just completed its second academical year, having been founded by some twenty undergraduate brass-rubbers in May, 1893, with Mr. H. F. Haines, B.A., son of the famous authority on brasses, as its first vice-president. The society has since more than doubled its roll of members. The society has a two-fold object: during term, to complete and revise the register, first of all brasses, then of all sepulchral monuments in the county and diocese of Oxford; and, during vacation, to promote the study and preservation of brasses elsewhere, as its members may find opportunity. The society has held two ordinary meetings in each of the last three terms, at all of which recent rubbings taken by members have been exhibited. Papers have been read on "Symbolism in Brasses," by H. M. Conacher; "The Problems of a Brass Engraver," by J. W. Crowfoot; "Heraldry," by A. R. Pinel; "Canopies in Brasses," by J. L. Myres; and "The Parish Church and Monuments of Minster in Sheppey," by W. H. Draper. At the last meeting, in Lent term, several members discussed the brasses which they had lately studied, and exhibited their rubbings. At a public meeting, held in November, in the Ashmolean Lecture Room, Viscount Dillon gave a lecture upon "Ancient Armour," and has since become an honorary member of the society. With its present programme and organisation, and with so many active brass-rubbers in its ranks, there is reason to hope that the society will continue to progress as rapidly as it has hitherto done during its brief existence.

THE City Commissioners of Sewers have had under consideration an application by the Central London and Waterloo and City Railway Companies to make modifications in the design of the subways leading to the central station about to be constructed at the Mansion House. The commission, two years ago, approved the plans and specifications, reserving, however, the right to alter or modify the details. The modifications now suggested by Sir Benjamin Baker and the other engineers to the railway companies, to be made in the general arrangement of the station, are principally to avoid interference with adjacent buildings. One of the alterations is to connect the platforms of the Waterloo and City Railway by inclined subways with the system of foot-passenger subways to be formed in front of the Mansion House. Another modification has reference to the proposed staircase at the corner of Princes-street, opposite the Mansion House. Owing to the vaults of the Union Bank projecting further beneath the public way than was originally allowed for and to the railway company being prohibited by their Act from interfering with those vaults, they desire to alter the plans of the staircase in such a way as to involve a further absorption of the carriage-way. The Commission consider this alteration highly objectionable, and have refused their sanction to it. Another suggestion which they have vetoed is to substitute a single for a double staircase at the east end of the Mansion House, and they have further declined to sanction an alteration in the line of kerb at the junction of Queen Victoria-street and the Poultry. In regard to the whole scheme, the Commission, before giving permission to commence any of the works, are requiring the Central London Railway Company to satisfy them as to their ability in every respect to complete the station, subways, and approaches in conformity with their Act. Further negotiations are, therefore, in progress between the Commissioners and the company.

The Commissioners of her Majesty's Works and Public Buildings are seeking Parliamentary powers next session to acquire, by compulsory purchase or otherwise, "all the land, houses, buildings, streets, roads, and premises situate within the area bounded on the north by Charles-street, on the east by Parliament-street, on the south by Great George-street, up to and including No. 23 in that street, and by Boar's Head-yard, and on the west by the building of the Institution of Civil Engineers and Delahay-street." The Act will empower the Commissioners, so far as may be necessary, "to stop up, remove, alter, or divert all or part of Charles-street, Parliament-street, King-street, Great George-street, Boar's Head-yard, Little Boar's Head-yard, Gardener's-lane, Delahay-street, Delahay-mews," and all other streets, sewers, mains, and works within the area described above, and to appropriate the site for the purpose of erecting thereon public offices.

The 142nd session of the Society of Arts was opened on Wednesday evening, when an address was delivered by Major-General Sir John Donnelly, K.C.B., chairman of the council, who took as his subject the present position of technical instruction in this country. He reviewed what is being done as a preparation for it in elementary schools, and to promote it through the Science and Art Department, and urged that the suspicion of wasted funds should be met by concerted action and more systematic inspection and examination. Next Wednesday a paper on "Locomotive Carriages for Common Roads" will be read by Mr. H. H. Cunynghame; and the subsequent lectures before Christmas include "Mural Painting, with the Aid of Metallic Oxides and Soluble Silicates," by Mrs. Anna Lea-Merritt and Professor W. C. Roberts-Austen, C.B., F.R.S.; and "Water Purification by Means of Iron," by Mr. F. A. Anderson. The first course of Cantor Lectures will be by Mr. W. Worby Beaumont, M.Inst.C.E., on "Mechanical Road Carriages." The other courses for the session will be by Dr. J. A. Fleming, F.R.S., on "Alternate Current Transformers"; by Professor J. M. Thomson, F.R.S E., on "The Chemistry of Building Materials," a series of three lectures to be given on Feb. 17 and 24, and March 2, 1896; by Mr. H. Graham Harris, M.Inst.C.E., on "Refrigeration"; by Mr. Henry A. Miers, M.A., on "Precious Stones"; by Mr. James Swinburne, on "Applied Electro-Chemistry."

The trustees of the late Earl of Dysart have, after prolonged negotiations, drafted a Bill for introduction into Parliament next session with a view to settling numerous questions that have arisen with the public authorities in their endeavour to develop the Dysart estate in Surrey. Under this Bill the Corporation of Richmond will, in consideration of concessions made by them, receive as a gift from the trustees the whole of Petersham Meadows as a recreation ground for the public. The trustees also propose to maintain as open pasture land for ever, other meadows adjoining the proposed recreation ground, and also to obtain leave from the Court of Chancery to transfer to the corporation the wooded slope behind the Star and Garter Hotel, known as Petersham Common. By these concessions on the part of the trustees the Corporation of Richmond will preserve the famous view from Richmond-hill, and in consideration of these gifts the corporation undertake to support the passage of the Bill through Parliament. The Bill will also deal with the vexed question as to the ownership of the towing-path on the Surrey side of the river Thames between Richmond and Teddington Lock, and proposes to vest Ham Common in the hands of the Ham District Council as an open space.

A deputation of trade-unionists waited, on Friday, on Mr. Hanbury, the financial secretary to the Treasury, to urge him to do all in his power to carry out the fair contracts resolution passed by the House of Commons in 1891. Mr. George Dew, organising delegate of the Amalgamated Society of Carpenters and Joiners, mentioned instances which had come under his personal cognisance, in which the War Office had given out contracts to employers who were paying a halfpenny per hour less than the trade-union wages prevalent in the district. In reply, Mr. Hanbury promised to do all he could towards the carrying out of the House of Commons resolution as to the payment of trade-union rates of wages and the practice of sub-letting contracts. He also declared himself in favour of publicity being given to the names of firms contracting for Government work, but protested strongly against the unsupported suggestion that Government officials were sometimes personally interested in contracts.

CHIPS.

At the Museum of Practical Geology, in Jermyn-street, W., a commencement has been made in the formation of a collection of the principal bricks made in this country, showing in each case samples of the clay or clays employed in the manufacture.

The school board for Sedgley adopted on Tuesday plans by Mr. Brevitt, for new schools to be built in Bilston-street. Accommodation will be provided for 900 children, at an estimated cost of £7 per head.

The public park at Duns, N.B., some 13 acres in extent, has now been completed. Seven acres of the park have been laid down in grass, surrounded by plots filled with hardy flowering shrubs, while the eastern part is entirely devoted to flower plots and lawn, studded with trees. A walk of nearly half a mile in length encircles the grounds, and at convenient points are a bowling-green, tennis-court, and quoiting pitch. The work has been executed by Messrs. Dickson and Co., of Edinburgh.

An examination has been held in the Court of Bankruptcy of James H. Bryett, builder, Romford-road, Forest Gate, who commenced business in September, 1893, with a capital of £75. The accounts show liabilities £7,232, of which £2,082 is unsecured, and an estimated surplus of £57.

The Great Ferris Wheel at Chicago, which was the *clou* of the World's Fair in 1893, and the original of the structure at Earl's Court, has been removed from Midway-walk at Jackson Park, to the northern part of the city, and was re-completed and made its first revolution on the new site a fortnight ago.

A new church, dedicated to St. James-the-Great, was opened by the Bishop of Ely on Saturday week, in the fen district of the large agricultural parish of Mildenhall, Suffolk. It replaces an iron structure which was wrecked in the great storm of last March. The present building of flint and stone, with a small tower, porch, and vestry, will accommodate about 120 people.

On Wednesday the old parish church at Ashampstead, Berks, was reopened after restoration. Mr. Alfred Waterhouse, R.A., LL.D., in addition to giving a handsome subscription, has also acted as honorary architect. The old unsafe nave-roof has been entirely renewed, and the original oak roof inside revealed, and much sham lath and plaster-work about the church removed, bringing to light again the old oak supports to the towerlet, which has also been renewed. The vicar is now raising additional funds for a vestry and for two bells to take the place of those sold in 1809-10 by the then vicar and wardens.

A stained-glass window has just been put up in the north aisle of the parish church of Berkeley, to the memory of Elton Vivian Gifford, by his mother, Lady Gifford, and his brothers and sisters. The window is the work of Messrs Burlison and Grylls, of London, and the subject is "The Peacemaker."

The first portion of the new municipal buildings at Oxford, now in course of erection from designs by, and under the superintendence of, Mr. H. T. Hare, A R.I.B.A., York Buildings, Adelphi, W.C., was opened on Friday by the mayor of the city. It consists of the public reading-room, being a section of the free library. Messrs. J. Parnell and Son, of Rugby, are the builders. Mr. Stanford being the local manager, and Mr. Evans is the clerk of works.

Mr. P. N. Russell, the original founder of the engineering firm of Russell and Co., has given the sum of £50,000 to endow a school of engineering in connection with the Sydney University.

The celebrated picture of "Calais Gate," by William Hogarth, which was presented by the Duke of Westminster to the National Gallery in July last, is now hung in the gallery in Room XVII. The picture, which is numbered 1464, has been until recently at an exhibition at Chester.

By arrangement with the Trustees of the Peabody Donation Fund, the Vestry of St. Mary, Islington, some years ago carried out sewerage works for the Peabody Buildings in Greenman-street, and when these were afterwards found to be defective, the vestry called upon the trustees to abate the nuisance. The question who was responsible for the expense thereby entailed came on Wednesday before the Lord Chief Justice and a special jury, when a decision was given against the vestry on all the main points in dispute.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Surveyors' Institution. "Landlords and Tenants in Ireland," by R. M. D. Saunders. 8 p.m.
Tuesday.—Auctioneers' Institute. "Compulsory Purchase," by H. Logan, M.S.B.L. 8 p.m.
Institution of Civil Engineers. Discussion on "Subaqueous Tunnelling." 8 p.m.
Wednesday.—Carpenters' Hall Free Lectures. "Setting Out Work and By-Laws," by James Bartlett. 8 p.m.
Society of Arts. "Locomotive Carriages for Common Roads," by H. H. Cunynghame. 8 p.m.

At Wednesfield, a new board school accommodating 300 children, and built at a cost of £2,200, was opened on Monday.

The marriage took place at St. Michael's, Shrewsbury, on Tuesday, of Mr. Arthur Edward Lloyd-Oswell, A.R I.B.A, Shrewsbury, second son of the late Rev. Henry Lloyd-Oswell, rector of Llandinabo, and Mabel Frances, youngest daughter of the late Rev. Charles Amphlett.

The town council of Edinburgh adopted on Wednesday, by 18 votes to 9, a proposal to erect four tenements of workmen's houses on property belonging to the city at Tynecastle.

The President of the Royal Academy has pronounced judgment in the statuette competition instituted by the Art Union of London. Sir Frederic Leighton's award is given to a model for a statuette representing "Hero," by Miss Margaret Giles, of Bristol, who gains the premium of £150 offered by the Society.

The parish church of Wainfleet has just been restored from plans by Mr. J. B. Corby, of Stamford. The works include reseating in oak, and new floors of pitch-pine wood blocks on concrete. An oak chancel screen has been added—the lower part filled with open tracery, the upper part having tracery heads, moulded cornice. The new pulpit, of oak, is fixed on a carved Ketton stone base. The hot-water service has been rearranged. The cost has been £700. The works have been executed by Mr. J. T. Turner, Wainfleet, and the carving by Mr. W. Hilliam, of Stamford.

A new boys' school has been built in Cambridge-road, Devonport, adjoining an existing school for girls. The building is of two stories, and is constructed of brick. It is planned on the central hall principle, and has eight classrooms, accommodating 528 children, each classroom opening directly out of the hall. Cloakrooms and lavatories are provided at the hall entrances, from which granite staircases in duplicate lead to the upper floor. The foul air is drawn off by Boyle's ventilators on the roof. The central halls and the upper floor rooms are lined with brick above dados of Robinson's cement, whilst the plastered rooms have pitch-pine dadoes. The building is heated throughout by a low-pressure hot-water apparatus. The general contractors were Messrs. A. R. Lethbridge and Sons, and the architects Messrs. Hine and Odgers. It has been completed within the contract sum of £5,280. Mr. Hoskyn has been the clerk of works.

The Hay Urban District Council have decided to purchase from the local waterworks company their undertaking, and by an agreement entered into between the parties the price to be paid for it, as well as the amount of compensation to be allowed to the secretary of the company, has been referred to the sole arbitration of Mr. Edward Pritchard, M.Inst.C.E., of Birmingham and Westminster. The arbitration proceedings were commenced on Monday in Hay, when the arbitrator made an inspection of the undertakings to be acquired by council.

The lending, reference, and technical libraries formed in connection with St. Bride's Institute, Bride-lane, Fleet-street, E C., were opened by Sir Walter Besant on Wednesday. The institute, which has been erected from designs of Mr. R. C. Murray, by Messrs. W. Brass and Sons, was illustrated in our issue of Nov. 17, 1893, and on Nov. 2, 1894, we gave reproductions of the medallion portraits by George Tinworth of Mr. J. Passmore Edwards and the late Mr. William Blades, both liberal donors to the library.

An action brought by certain inhabitants of the Guildford Rural Sanitary District, to restrain the Guildford, Godalming, and Woking Joint Hospital Board from using a plot of land on Whitemoor Common, Guildford, consisting of two acres, and a cottage thereon, for a small-pox hospital, and from erecting a small-pox hospital on the said plot of land, was heard by Mr. Justice Kekewich, in the Chancery Division, on Monday, Tuesday, and Wednesday. The learned judge considered that the existing cottage was not a suitable place for small-pox patients, but there would be no objection to erecting a fresh building for such a purpose on the site, and no well-founded apprehension of danger.

PADDINGTON UNION. — SANITARY WORKS AND ALTERATIONS.—QUANTITIES for this work, prepared by an experienced Quantity Surveyor, can be obtained on speculative terms from — SURVEYOR, 57, Porchester-road, Paddington.

W. H. LASCELLES and Co.,
121, Bunhill Row, London, E.C.

CHURCH BENCHES & PULPITS.

ESTIMATES GIVEN ON APPLICATION.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.

Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

⁂ Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

COTFORD.—For the completion of the lunatic asylum at Cotford, for the Devonshire County Council:—

Willcocks and Co., Wolverhampton £75,350 0 0
Accepted.

[Owing to failure of previous contractor, new tenders were invited.]

FINSBURY PARK, N.—For enlarging the lodge at Finsbury Park, for the London County Council. Mr. T. Blashill, superintending architect:—

Wallis, A.	£282	0	0
Britton, F.	273	0	0
Hart, P.	270	16	0
Lapthorne, T., and Co.	246	0	0
Harding, R., and Son	243	2	5
Wells, W.	230	0	0
Williamson and Sons	219	15	5
Pancy, W.	216	0	0
Thorne, W.	212	8	4
Jeffries, G. E. (accepted)	193	10	0

(Architect's estimate, £226.)

GATESHEAD-ON-TYNE.—For erection of bakery at Low Fell, for the Gateshead Industrial Co-operative Society, Ltd. Mr. E. Bowman, 62, Grainger-street, Newcastle-on-Tyne, architect. Quantities by the architect:—

Lunn, J., Newcastle	£1,757	0	0
Lamb, T. and R., Gateshead	1,709	0	0
Tyrie, W. C., Gateshead	1,693	0	0
Hunter and Co., Low Fell	1,688	0	0
Raven and Hitcham, Gateshead	1,656	0	0
George, E. and T., Newcastle	1,627	0	0
Draper and Sons, Leamside	1,618	0	0
Wakefield & Henderson, Low Fell*	1,573	0	0

* Accepted.

GOFF'S OAK.—For the erection of two cottages at Goff's Oak, for the Receiver for the Metropolitan Police District. Mr. John Butler, F.R.I.B.A., architect. Quantities by Mr. W. H. Thurgood:—

Higgs and Hill	£1,784	0	0
Lawrence and Sons	1,745	0	0
Gardener	1,650	0	0
Richardson	1,625	0	0
Waterman	1,620	0	0
Wilmott and Sons	1,595	0	0
Bunce	1,590	0	0
Almond and Son	1,488	0	0

LEEDS.—For heating the enlarged portion of Green-lane Board School:—

Newsum, Roberts, and Co. (accepted).

HEXHAM.—For the erection of a branch bank, for Messrs. Lambton and Co., bankers, Newcastle-on-Tyne. Mr. John W. Dyson, M.S.A., Grey-street, architect. Quantities by Mr. J. P. Allen, P.A.S.I., Grainger-street, West Newcastle:—

Weatheritt, T., Newcastle	£5,267	10	3
Middlemiss Bros., Newcastle	5,243	13	6
Tyril, W. C., Gateshead	5,180	0	0
Darlington, W. and J., Hexham*	5,016	13	4

* Accepted.

LEICESTER.—For the erection of a new factory, South Bond-street, for Mr. H. J. Creese. Mr. J. Smith, Briton-street, Leicester, architect:—

Gretton and Woolley	£449	0	0
Cooke, J. R.	442	7	0
Clayton, J. H.	440	0	0
Hill, J. N.	426	0	0
Mason and Sons	413	0	0
Gurney, U.	401	0	0
Elliott, F. (accepted)	396	0	0

All of Leicester.

LONDON.—For electric-light wiring and fittings at the Cancer Hospital, Brompton, S.W., for the committee of the Hospital. Mr. Morgan Williams, Assoc.M.Inst.C.E., consulting engineer:—

	A.	B.	C.	D.
Crompton and Co.—	£668 0 0	£45 0 0	£107 8 0	£820 8 0
Rashleigh Phipps and Co.—	523 0 0	20 0 0	115 5 6	658 5 6
Leaf, H. M.—	330 0 0	25 0 0	99 11 6	454 11 6
Drake and Gorham (accepted)—	309 0 0	25 0 0	86 19 0	420 19 0
Sotheby and Co.—	293 10 0	26 10 0	77 14 0	397 14 0

A.—Wiring. B.—Cutting away and making good. C.—Fittings, exclusive of lamps. D.—Total.

LONDON.—For the supply and erection of three centrifugal pumps at the Heathwall pumping-station, for the London County Council:—

Warner, R., and Co.	£3,330	0	0
Cornes, Martin, and Co.	2,770	0	0
Drysdale and Co.	2,680	0	0
Tangyes, Limited	2,675	0	0
Entwisle and Glass, Limited	2,570	0	0
Blakeborough, J., and Sons	2,556	0	0
Gwynne and Co.	2,272	0	0
Cochrane, J.	2,200	0	0
Beaumont, W. (irregular)	1,925	4	0
Renshaw, W. R., and Co.	1,839	0	0

LONDON, W.C.—For finishing the Hotel Cecil, Salisbury-street, Strand:—

Waring, S. J. and Sons, London and Liverpool (accepted).

MITCHAM.—For erection of a lightning conductor on the water tower at Mitcham workhouse, for the Holborn Board of Guardians:—

Gray and Son, Leadenhall-street (accepted).

VOL. LXIX.—No. 2134.
FRIDAY, NOVEMBER 29, 1895.

PROVINCIAL ARCHITECTS.

THE addresses delivered to architectural societies in the provinces deserve more general notice than perhaps they are accustomed to get. They are important in many ways. Especially do they show, just now, that the evils which architects have to fight against, and the wants they feel, in one part of the kingdom, are pretty much the same as those in all other parts. The more this is perceived, the more hope is there that architects everywhere will unite in struggling with them. The essential weakness of the profession is its disintegrated state. There seems to be a sort of mutual repulsion between its members, and nothing but gross ill-treatment from outsiders can bring them together. Even this is not always enough. The architectural turnspit is still with us, and still ready, in the Law Courts or out of them, to assist in the roasting of a brother architect. Nor has he always poverty to plead as an excuse. It must be rather love of the occupation than need for the fees which tempts vice-presidents and F.S.A.'s to exhibit themselves, as they have been known to do, in this inglorious attitude—an attitude doubly ignominious when they fail to gain the sympathies either of the judge or the jury. But, even when less virulent, antipathies and jealousies do mischief enough. If it happens, for instance, that some unfortunate competitor has been ill-treated, and an effort is being made, under infinite difficulties, to get substantial justice for him, a good-natured friend is pretty sure to make the hard harder, by raking up old stories against him. The stories may be true, or they may, as is more likely, be only "founded on fact," but that is scarcely the time to make them public. They have their effect; the world believes them, but it is not likely to respect a profession which encourages them to be told. Turnspits and tell-tales are not the people that the public will ever look up to.

We welcome every increase in the strength and activity of provincial societies, because it implies an increase in the *esprit de corps* of architects generally. They are more isolated in country than in town, and so more tempted to consider each his own immediate advantage. But we do not for a moment imply that, at the lowest, they are more unscrupulous than the least honourable of so-called architects in London. They would find it hard, perhaps, to beat such a case as the following, which happened in a suburban district (we do not say when, or where). A large Sunday-school was to be built, adapted also, as such schools often are, for use as a public hall and concert-room. Three or four architects were invited to compete, a design was adopted, and instructions were given to prepare the working drawings. They were made and approved, and the committee were in the usual hurry to obtain tenders. Suddenly they interposed a mysterious delay. Nothing was done for months. Then the architect was summoned to meet them, and was informed that it had been decided to reduce the cost originally stipulated for, and that, unless he would make a new design without charging anything for the previous working drawings, the work would at once be taken away from him. While ready to sacrifice something for a philanthropic object, he was hardly prepared to be forced into it in this "money-or-your-life" style. He was removed next day from the appointment which he had secured by competition, and every pretext which ingenuity could devise was brought up to prevent his charges from being paid. At last he received the greater part of them, after threatening the committee with an action and an exposure. Then the work went on swimmingly, and the secret of the delay came out. A firm of "architects" who had already honoured him by copying one of his plans at a much-advertised building of theirs in the neighbourhood, had worked on the lowest motives of the promoters, and had wriggled themselves into his place. They adopted all his competition drawings, merely changing their architectural details into the "vernacular" of the small suburban builder. The cost was scarcely reduced at all; but the committee were satisfied. They had a grand opening and unctuous speeches. Everybody congratulated everybody else on the noble way in which this great work had been done. It was a triumph of principle, they said; a step towards the enlightenment of the neighbourhood. And the parting advice of their leading divine was, "Build your characters, my friends, *as you have built your schools!*"

However hotly reputable architects may contend in actual competitions, they do at least refrain from robbing others in this way of appointments for which they themselves never even competed. But as the architectural pirate exists, and sometimes flourishes, there ought to be means of covering him with the disgrace he deserves. It is rarely, perhaps, that he is a member of any professional body. He is safe, therefore, from expulsion; but he need not be secure from general contempt, and when architects are as united as they ought to be, they will be able to visit him with a penalty more proportionate than this to his deserts. But it is not only the presence of our worst foes—those of our own household—which should make us draw more closely together; it is also the pressure of the outside public. Turnspit, tell-tale, and pirate alike effect their nefarious ends by acting on clients and committees. Oftener than not, one or other of them, though modestly hiding himself in obscurity, is at the bottom of the mischief-making and fault-finding which the most capable of us suffer from. But it is not always so. The shabby man knows how to act shabbily even when there is nobody to set him on. "A churl does a churl's deed," as Chaucer puts it, by mere innate impulse. This is notoriously apt to be the case with committees. Just as the strength of a chain is that of its weakest link, so the honesty of a committee is commonly that of its shadiest member. The shady member—sometimes a lawyer and sometimes not—inserts a clause in the conditions, which gives the committee the power of doing most unjust and arbitrary things. Competitors fancy that a body of men, some of them of high standing—will never really avail themselves of the powers they reserve. Lookers-on know better. If the assessor's award goes to some local favourite, somebody with powerful friends—somebody, in fact, whom a great part of the committee want to appoint, whether he deserves the appointment or not—the arbitrary clauses will never be heard of. But if the successful competitor is an outsider—a young man, say, with no patrons and no influence—he has a fair prospect of being visited with the utmost rigour of the law. It matters nothing that his design was the best; it matters nothing that, in honour and fairness and equity, he deserves the appointment; it matters nothing that he spent weeks or months in hard work, relying entirely on the good faith of the promoters. "Let us kick him out," says the shady member; "we have got a clause that empowers us to do it, and so he cannot complain." The shady member gets a majority on his side, and the dishonest deed is done. The people who voted for it congratulate themselves that nobody can call them to account, and walk home with their heads in the air, every one of them posing for a picture of "the righteous man."

"Legal rights," as the President of the Northern Association truly says, "are often moral wrongs." But as there are multitudes of people—and of people making the highest pretentions to morality and conscience and religion—for whom "the law of their country is the limit of their honesty," the only safe course for architects is to decline having anything to do with those who reserve to themselves the power of arbitrary and unfair action. Assessors, above all, should refuse to let such powers be provided for in the competition conditions with which they are concerned. Such clauses could be ended to-morrow if architects everywhere were as true and loyal to each other as they should be. But, unfortunately, anybody, from an R.A. to a broken-down jerry builder can call himself an architect; and this wise world of ours too often takes him at his own valuation. Provincial societies, like London ones, may do much to prevent their members from walking blindly into traps; but they have little influence over the architects, and still less over the sham architects, who do not belong to them. To increase their own membership, and to put down the sham architect, who is the favourite tool of the shady committee-man, are two obvious aims which they have to keep in view. We should be glad, in particular, to see their thoughts more exercised than they have been, on the best way of effecting the second of these objects. It may be a slow process, whether it is done by examination or legislation, or both combined; but that is only a reason for setting about it with the more energy and determination.

We think Mr. Henman was right when desiring, in his address at Birmingham, that provincial architects should have more influence at the Institute. But if they do not, it is largely their own fault. Comparing the number of voting papers annually received with the number of Fellows and Associates entitled to vote, it is clear that a great proportion of the members do not interest themselves in the elections at all. Considering how many Metropolitan candidates are returned, it would seem that it must be the provincial architects mainly who thus fail to vote. If they voted, they could easily return their own men, and gain the influence they deserve. There is no prejudice against them in London, as they sometimes seem to fancy. The Metropolis, unlike some provincial towns, never seeks to exclude outsiders. If Mr. Henman settled in London, he would not be called a "foreigner," as a London architect is when he happens to obtain a commission in Birmingham. In fact, the best-known London architects are, or were, outsiders, and London is rather a gathering-place for provincials than a city with any strong individuality of its own. Still, those who have gathered here come to know each other, and naturally, in many cases, to vote for each other. But this is done with no set purpose of keeping down their brethren who have not yet arrived, or who never will arrive, from other towns. It is largely the result of accident, and it could easily be kept within bounds if provincial architects would vote, and would lean a little towards voting for each other.

MASKED ROTTENNESS.

TWO classes of dilapidated or ruinous buildings confront the district surveyors of the Metropolis. One is the shored-up and openly dangerous structures which have been reported on and made secure; the other class those buildings which present a respectable exterior, but which are a mass of rottenness within—the merest shells, which are ready to collapse at the slightest opportunity. It is of the latter class we now speak. The premises incipiently affected are numerous and widely scattered. We can hardly pass through an old street, whose houses have been repaired and renovated, which does not possess such buildings to which we refer; but they escape notice altogether, because their owners have been shrewd enough to make trivial repairs when necessary, and to avoid coming into contact with the authorities by making such alterations or improvements as would bring them under the statutable clauses known as the "dangerous structures" clauses. The houses which fell the other day in the Westminster Bridge-road are presumably of the type we are referring to. They were externally so presentable and well cared for as not to have aroused the slightest suspicion. In the hands of painters and plasterers nothing could be suspected of them; they had apparently well-built, neat brick fronts, coloured and "tuck-pointed," a mode of external decoration which allays any feeling of alarm, and is at once one of the surest means of securing tenants. When the outer wall, without any warning, fell into the roadway, miraculously without doing any bodily harm to anybody, and the whole interior collapsed as a mere heap of rotten ruins, the unreliability of these external and superficial renovations was startlingly made evident. The cause of failure is at present not very clear, and the only conclusion we can draw is that from some obscure rottenness and want of internal tie, the wall gave way. The district surveyor never had any misgivings. How could he? The front had been retouched up and repointed, and there was nothing, it is alleged, that gave any doubt about the safety of the building. There are hundreds of such houses in London which have escaped the official eye. Many of them have suffered years of internal tinkering, partitions pulled down, chimney jambs cut through and supported to make shops and show-rooms, cross walls removed or cut through, floors tampered with, and timber beams and joists cut or weakened, while the external front wall has become a mere mask, touched up by paint or repointed at intervals, and intended to exclude from inspection all the alterations that have been going on interiorly. The old Building Act allowed such a condition of things to exist. Unless the council had intimation of the dangerous state of any structure, no survey or report could be made; the district surveyor was in many cases ignorant of these buildings, or had no information as to their condition internally, and it was the interest of property owners to keep such matters from the surveyor. The new Act is still inadequate to meet the requirements. Sections 207-209 cannot be made applicable to any premises such as those named. They are only operative when certain things are done, as where a party or external wall has been "taken down, burnt, or destroyed to the extent of one-half" where additions or alterations are made to buildings, except those "of necessary repair not affecting the construction of any external or party-wall." But the majority of repairs or alterations would come under this exception, and so would escape the attention of the surveyor. Yet as we desire to show, it is just this class of building which the building statutes cannot touch, and which are masked by fair façades, that require special attention. Their fronts are recoloured and the brickwork repointed, or the whole front may be stuccoed and repainted, concealing behind a rotten structure of floors and partitions, which hold together upon, perhaps, the rotten end of a wooden beam. The structural vicissitudes which the external front wall undergoes is not often taken into account. Generally the front of the house has been taken out for a shop-front, and a bressummer or girder to be inserted to carry the wall over, and this is not always above suspicion; it rests on party-walls which have been tampered with, or piers that are not substantially built in cement—perhaps the foundations have been shaken or interfered with. Then the wall itself has settled and cracked between the window openings: it has lost its bond, and has no direct tie. In this condition it is stuccoed over and painted, or the brickwork is stopped in and coloured with yellow ochre, or rubbed down and tuck-pointed, and the premises are made to look like new. Very few of the old brick-fronted houses have not been subjected to this treatment, and it is owing to this masking of the real condition of the wall that the risks are increased. Since the fall of the wall in Westminster Bridge-road other portions of adjoining houses have fallen. By the light of these facts, the London County Council will do well to make their surveys a little more thoroughly in the case of old premises which, though not outwardly dangerous in appearance, have been repointed or renovated. To discover them it may be difficult from a a casual survey of the exterior: an examination of the internal walls and floors is necessary. As we have said, the openly dangerous structures with overhanging or cracked walls are easily found out; but the neatly-pointed or stuccoed front may elude the surveyor for years. Excavations may have been made in the basements and cellars for drains which have undermined the walls without being discovered, or insufficient girders introduced to carry upper walls, all which and similar operations may have been carried out without arousing any suspicion. The danger of allowing unsuspected properties to pass unnoticed is increasing year by year, with the rapid growth of the Metropolis; but a register of all old properties, especially those which remain unlet, and which are pointed or stuccoed, ought to be made.

MISUSED MATERIALS.

RUSKIN, the apostle of colour and nature, speaks of the "nobleness and loveliness of colour"; in another place, that it is "the holiest, the most divine, the most solemn gift of God." "All good colour is in some degree pensive," he remarks. The builders of our great cathedrals, he says, "veiled their casements and wrapped their pillars with one robe of purple splendour." Though in a figurative sense, perhaps, all this is perfectly true to those who have eyes to see, yet it is strangely at variance with the ordinary builders' and architects' practice, who seem to think colour must be entirely sacrificed to other qualities—neatness, trimness, hardness, smartness, or violent contrast; and so they choose their materials because they think they are the best, without the slightest thought of environment. As the same authority tells us somewhere, the world is made up of "thinkers and seers," but the seers are the "greater of the two." "Hundreds of people can talk for one who can think, thousands can think for one who can see," and so it is in the choice of materials. There are plenty of theories and a redundancy of material at our disposal; but it is quite as often we select the worst, because we reject the sense of colour, and think that to be the most suited to our wants which is everywhere used, in town and country, hillside and moor alike, and which manufacturers and expert scientific writers catalogue and recommend. The artistic sense of colour, and the equally important ones of seeing and feeling, are disregarded in our purview.

There are two senses in which we now speak of misused materials: one is material not adapted for its purpose, and the second material put in the wrong place. In the first of these meanings we may include all materials which are not suited for a given use, as, for example, where stone is employed for resisting transverse strain, and timber for columns which have to carry great loads; where plastic materials are used for purposes for which they are not adapted. In the second sense, we chiefly dwell on the question of adaptation or the choice of material as it concerns artistic considerations, as, for example, when red brick is used in positions or localities which would be better served by stone or some local material. It is a question rather of harmony or contrast with the surroundings. Slate is equally as good, often better than, red tiles for roofing, and so is suitable in the first sense; but as a matter of harmony of texture or colour, it may be ill-adapted and inartistic. So, in short, we have physical unsuitability and artistic misapplication to deal with in all the materials we are called upon to use. They do not overlap. Practical treatises on materials mainly deal with the first of these: they tell us which are the best limestones and sandstones for resisting crushing and disintegrating forces, as those of water and atmospheric acids; which is the most brittle; what kinds of timber are best adapted for given purposes; the properties and strength of iron and steel, of cement, and so on. But if the architect only consulted these textbooks on materials, he would be often committing serious mistakes in an artistic point of view. We have proof of this in the advice often given by authors of books on building construction. In one of these—a recent handbook for students passing Institute and Technical examinations—the author describes how cement stucco-work can be lined out to imitate blocks of stone—a purpose that may be quite within the legitimate use of the material, but yet is flagrantly wrong in an architectural sense. So we read of wooden bressummers used to represent stone fascias, and iron columns made to carry fronts that would be better carried by stone or brick piers. We have no farther to go than to the designs of some of our engineers for examples of artistic misapplication, as when we see yards of painted ironwork doing duty where brick or stone are the natural materials, or the finely-chiselled and jointed masonry of the Tower Bridge casing a framework of steel. Mr. W. D. Caröe, in his presidential address the other day, referred to this structure and the turncock's shed which engineering enterprise had erected marring the natural beauty of the grassy slopes of great Helvellyn. Instead of the natural grey stone or boulders, which are plentiful, and harmonise with all the surroundings of lovely Thirlmere, the engineer introduces a "friable red stone" to face the dam, and other vagaries of material and style. We have plenty of such examples of misuse in London and other places—quite legitimate according to the scientific builder's creed, though completely at variance with the teachings of Nature. How many a humble and picturesque village or suburb of our metropolis is marred by the erection of buildings in red "tuck pointed" brickwork, with all the rigid lines and the fussy accessories of bays and gables of modern villadom. So far, then, it is quite possible for the scientific textbook of modern science to be closely followed without in one degree imparting the knowledge essential to choose material properly, or to give a truthful character to our buildings.

Of course, it is absolutely necessary to observe certain principles and physical laws in the use of materials. An architect could not be forgiven for using a friable or soft stone in any external position, such as soft limestone for weatherings or copings; for using a stone of little resistance to carry a great load; for employing iron in positions better filled by wood—mistakes made every day. Examples of misused materials in these senses are common enough. We have seen such things as iron girders and roofs resting on, and tied to, brick walls, without any means for expansion and contraction, iron columns used in conjunction with brick piers built in mortar, iron ties introduced in stonework. We are constantly seeing the misuse of iron in columns. Who has not seen a foliated capital with fluted shaft to imitate a stone column, or a deeply-undercut moulded capital, which is not only extremely difficult to cast from moulds, but shows an utter ignorance of the art of the founder or the process of contraction in cooling. In the employment of wood the most elementary physical laws are equally disobeyed every day, and no one is any the wiser. The expansion and contraction of wood is not suspected; often it is used too dry, and then we get panels that swell at the slightest change of weather. When the wood is over-seasoned or dried in hot weather, it is not fit for panelled work. If the panels are fitted too tight in the grooves, when the first damp weather comes on, they expand or buckle, or cause the framing to give way. Carpenters and joiners often misuse planks and deals by not considering the manner in which they shrink in seasoning. It is a good rule that timber should never be seasoned in a warmer atmosphere than that which it will occupy in the building. The shrinkage in seasoning always follows a certain course, which can be observed by looking at the way a log shrinks and the planks cut from it: the outer layers contract more than the inner, and the outer planks twist hollow or become warped. Then a misused material may be seen whenever the designer has employed it wrongly—as, for instance, when he specifies castiron for a purpose in which cross strain is set up; when he designs shafts of stone or marble with a spiral for the sake of ornament, or employs plaster and other plastic substances for ornamental features where cohesive strength is called for. We may enumerate mistakes of this sort by the hundred, in modern, commercial, and speculative buildings, where cheapness is the leading consideration.

In these remarks, however, we rather dwell on the subject of misused materials on the artistic side, than on the physical. The latter may be perfect, as we have shown, and follow every dictate of science, and yet be inharmonious and repellent to good taste. No scientific authority on materials ever pointed out the objection to using cement for stone. A brick stuccoed wall is agreeable to the soundest science; but it was perceived by the true seer that it was a folly to build such a wall in a stone locality, and to make it imitate stone. It was not an engineer who pointed out the architectural misuse of iron; we presume it was the new light that burst upon us when the first revivalists woke to the fact that iron has its limitations as well as its duties, which make it serviceable as a tie or girder, but not as a column, and never for any construction which originated with stone or even wood. No one with the slightest knowledge of design thinks now of applying the rules of treatment necessary for stone or wood to a plastic material. All these things are well known to the architect; but even he is caught tripping occasionally, as when he thinks out his work in lines without any regard to the material it is to be executed in. We may take as an instance of this a design for a building to be carried out in stone or brick and stone. The elevations and details of windows and doorways, columns and turrets, are drawn out for stone; brick is afterwards decided upon to reduce cost, but no alteration is made in the details. In another instance—a case very frequent in carrying out competition designs—terracotta is substituted for stone dressings, the same details being worked to. With such an elasticity of conscience, the modern architect accommodates his design, and adds the alternative item in his quantities, "The same if executed in terracotta instead of stone." No matter that one material is worked with the tool and the other moulded in clay; that the mouldings of one are free and deeply undercut, as those of the other are limited to small projection and flat contour. Again, we often see the materials and workmanship suitable for a suburban villa—red and pointed brickwork, and timber framing and plaster—introduced in the midst of a district where stone is plentiful and its working cheap. The stone would naturally blend harmoniously with the surroundings, besides being less costly. But is not the contrary also equally glaring, when soft limestone is employed in good brick-earth localities and in places near the sea, exposed to the weather? A mode of working granite or stone which is perfectly justifiable at Glasgow or Leeds is as ill-adapted in a London building, where it is quite out of place, as it is to erect a half-timbered building in a Yorkshire town. Misused materials are not confined, however, to methods of working stone or brick; they are equally the result of misapplied style, when, for example, the old timber and parquet work of Chester is transplanted near bleak Scottish or Yorkshire moors, and all the irritable and fussy details of gable, dormer, and carved wood are introduced amidst quiet and secluded country surroundings. The colour or tone of materials are not less to be considered. Red brickwork and tile are always pleasing amidst trees; but there are some situations, as in the districts of Cornwall and Aberdeenshire, where the redness is certainly glaring and obtrusive, and the grey mountains would harmonise better with the native limestone or granite.

THE SURVEYORS' INSTITUTION.

THE first paper of the session, 1895—96, was read before the meeting of this Institution on Monday last, November 25, by one of the new Irish Fellows of the Institution, Mr. R. M. D. Sanders, of Sanders' Park, Charville, co. Cork. The subject of the paper was the relations of "Landlord and Tenant in Ireland," and Mr. Sanders was fortunate in having as chairman for the evening, Mr. D. Watney, the president of the Institution, whose practice has made him very familiar with Irish land questions. It would be impossible to give, in the space which we can allot to it, a complete *resumé* of Mr. Sanders's paper; but we are glad to note that he considers the present time a favourable one to discuss the matter. He thinks that there is now in power a Government strong enough to carry out what they know to be right, unhampered by party fears and party exigencies. It has, he says, always been the misfortune of Irish Land that her troubles have always been made a medium for political agitation, and that any suggested improvement in the land laws has never been without the suspicion of some political bias. The basis of all Irish law of landlord and tenant was a contract of tenancy. None of the English customs of forfeitures and reversions, and such-like, prevailed. They were destroyed in the creation of the relation of landlord and tenant. If there be two parties to an agreement in which one agrees to be landlord, and the other to be tenant, the relation of landlord and tenant would exist. Mr. Sanders then briefly reviewed the Act of 1860, which, he said, provided for the simplification of ejectments, and secured to the tenant whatever were not actual fixtures; but which did not deal with the all-important question of permanent improvements. After the subsequent agitation of 1869, Mr. Gladstone introduced the Landlord and Tenant Bill, which received the Royal assent on August 1, 1870. The Act legalised the Ulster customs; but left it to be proved that they varied in various cases. Under this Act, the amount of compensation was subject to limitations. The tenant could not claim for improvements more than 20 years old (unless they were buildings or reclamations), nor for any that were injurious to the landlord's estate, nor for improvements under a contract for valuable consideration (which would include the case of a man who let on lease at a value lower than the actual value, in order that the landlord might do the repairs). A scale of compensations had been (the speaker said) laid down, and was taken up by the courts in the case of all new defendants. The whole difficulty of the land question in Ireland was, according to Mr. Sanders, the lamentable fact that while Englishmen did not understand what was necessary in a country, with customs entirely differing from those they were used to, with laws bearing in several ways against the adoption of any English system, with customs inherent to the soil, they, as the governing body in Parliament, had made laws, for the solution of purely social and domestic questions, on party lines. The Land Question in Ireland, which was undoubtedly the question on which the prosperity of the country turned, had always been tacked on to some party agitation, or to some one-sided political programme, and had never been allowed to show itself as the grave and important element in the prosperity of Ireland which it undoubtedly was, in spite of the strife of parties. Mr. Sanders gave many details and statistics to prove his case, and, judging by the careful attention they received, and the cordial acceptance of them at the hands of the many expert land-agents present, they accurately represented the hardships under which Irish land now suffers. He looked forward to better times, when the question should be removed from the arena of political contest, and carefully deliberated and dealt with on sound and disinterested legislative lines. He recognised all the difficulties, but did not seem in the least to despair of the result.

A cordial vote of thanks to Mr. Sanders was moved by Mr. J. Luard Pattisson, C.B., who agreed with Mr. Sanders that the effect of legislation had been rather to discourage than to encourage Irish land, and who quoted statistics showing that while, at the date of the Union, the population of Ireland was $5\frac{1}{4}$ millions, it rose to $8\frac{1}{4}$ millions in 1845, was only $5\frac{3}{4}$ millions in 1861 (after the drain by famine and emigration), was $5\frac{1}{2}$ millions in 1871, a little over 5 millions in 1881, and less than $4\frac{3}{4}$ millions in 1891.

The vote of thanks was seconded by Mr. John Shaw (Member of Council), and the proceedings were brought to a close by an eloquent speech by Mr. Carson, Q.C., M.P. (for Dublin University), who contended that the Land question was at the bottom of all Irish difficulties, and that if it could once be settled on fair lines—apart from party considerations—the solution of the remaining problems would be simple. Free contract was essential. Compulsory sale might be advisable: but whether the landlord bought the tenant's rights, or the tenant purchased the landlord's, freedom of contract must be the ultimate object of any useful legislation.

THE HOME FOR EPILEPTICS, CHALFONT ST. PETER'S.

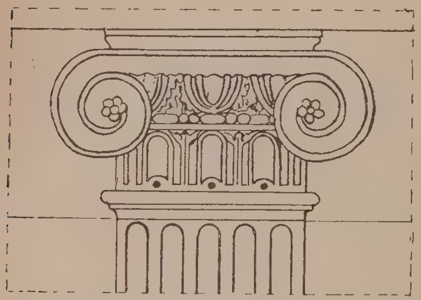
THE Duke of Devonshire, who was accompanied by the Duchess, opened, on Monday afternoon, the new home (the "Passmore Edwards House") in connection with the colony of the National Society for the Employment of Epileptics, established at Chalfont St. Peter, South Bucks, on a farm given by Mr. Passmore Edwards. The home, which was illustrated in our issue of August 9 last, is the first permanent one erected, and provides accommodation for 18 colonists, in addition to an isolated house with two beds. Messrs. Young and Hall were the architects, and Mr. Darlington, of Amersham, was the contractor. The committee, in their appeal for funds to enable them to extend the scope of their operations, point out that large numbers of afflicted persons, even if good workmen, are unable to obtain employment by reason of their disorder, and that under the conditions of medical attention and sanitary surroundings secured by a colony, they are enabled to live a life of usefulness instead of one of enforced idleness, ending in many cases in the lunatic asylum. The progress already made by the little band of colonists is reported by the honorary medical staff to have surpassed all expectations, and the success attained has led to offers of a sum sufficient to erect a home for women (in addition to the one already erected for men) and two for children. A heavy outlay, however, will be necessary to equip the new homes with furniture, work-rooms, and school accommodation, while the drainage system and water supply must be considerably extended. In opening the home, the Duke of Devonshire said it was important that public attention should be directed to the work of the society, because the number of epileptics of all classes, for whom the colony was intended, was very large—he was informed between 30,000 and 40,000 – and their condition was so pitiable that there was little doubt that adequate support would be forthcoming if only the ear of the public could be obtained. There was no treatment which was more effective for the mitigation of epilepsy than healthy and congenial employment, as had been proved by the experience of a colony which had existed in Germany for 26 years. He thanked Mr. Passmore Edwards for the munificence which had provided the society with the farm which was to be the scene of the future colony, and to which also they were largely indebted for the home now opened. He hoped that the splendid example set by Mr. Passmore Edwards might be followed by others.

CLASSIC DETAILS AND THEIR APPLICATION.*

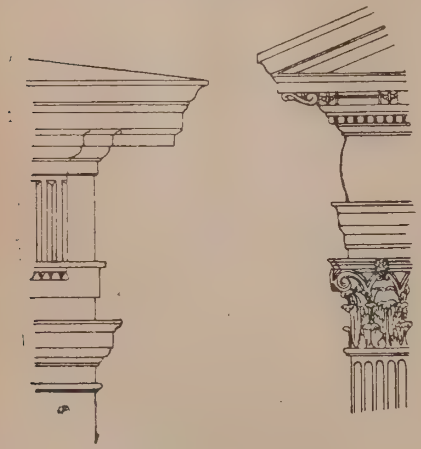
By G. A. T. Middleton.

XVIII.—FRENCH RENAISSANCE: FEATURES OF THE LATER PERIOD.

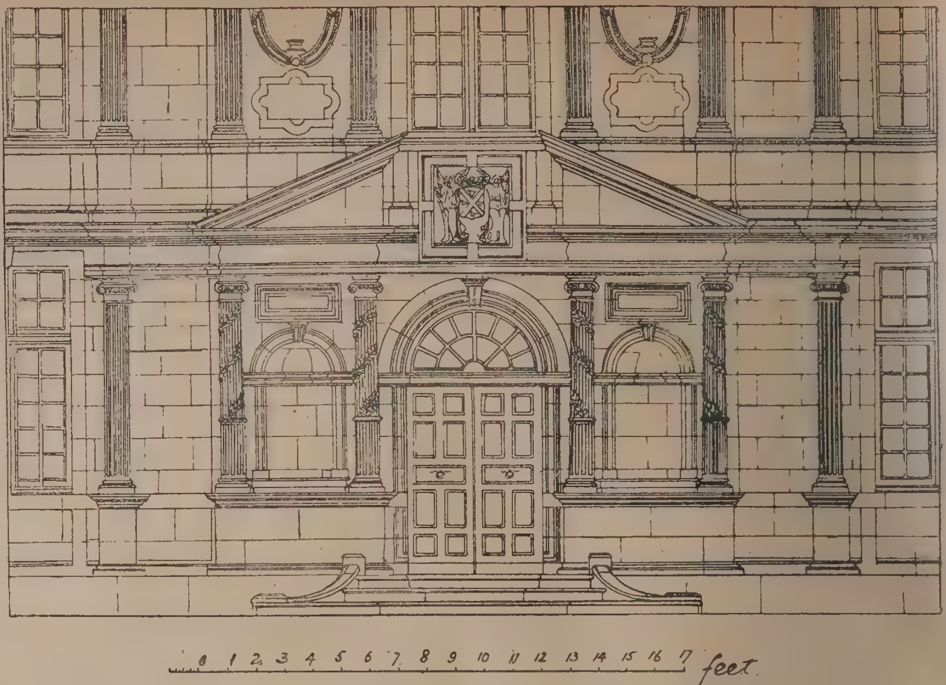
ELEGANCE had been the keynote of the French Renaissance in its early times, and remained its keynote throughout, in spite of the incongruities and absurdities which characterised the period commonly known as that of Henri Quatre. A somewhat extreme example of this is the doorway of the Château des Ifs, which is illustrated herewith. The Orders are used more definitely and more formally than would have been the case in the preceding period; but are almost lost sight of in the mass of heavy applied ornament. The shafts of the columns are entirely hidden in rusticated blocks, out of which, of course, it is to be (falsely) assumed that subsequently they are to be chiselled; and then the bed-mould of the cornice rests directly upon the capitals without intervening architrave or frieze, the increased height of the Ionic capitals needed to carry off the heaviness of the whole design being supplied by heavily drooping swags. This cornice, however, is only the lower of a pair of cornices, and æsthetically serves but as the architrave to the upper; the space usually devoted to the frieze being filled with a broken pediment converted into scrolls. Above comes the true cornice of the order, surmounted again by a broken pediment, the break being objectless, and filled with ornament which would better have been omitted.



Ionic Capital, Chateau de Joigny.—(*From* Sauvageot.)

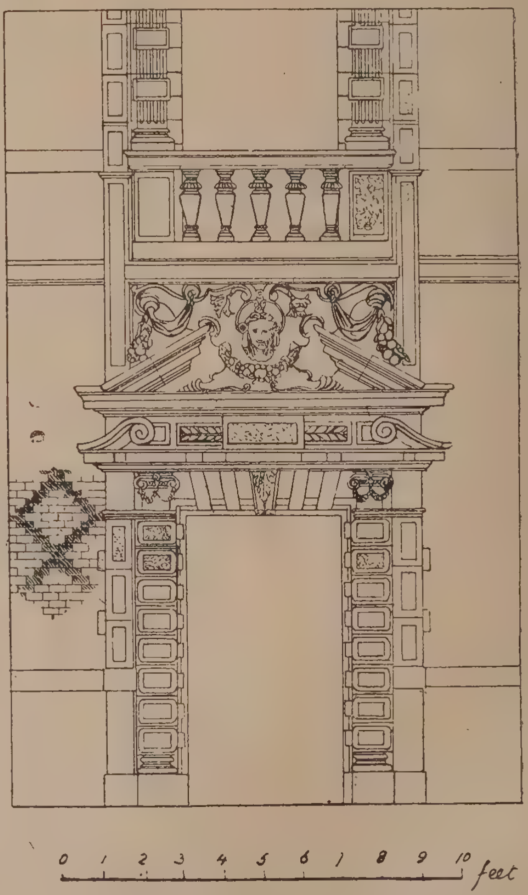


Doric and Corinthian Orders, Chateau Maisons sur Seine.—(*From* Sauvageot.)



PRINCIPAL ENTRANCE, CHATEAU DE BUSSY-RABUTIN.—(*From* Sauvageot.)

Almost contemporaneous is the doorway of the Chateâu de Bussy-Rabutin; but the orders have been more frankly shown, and the light and elegant French proportions are in evidence, with infinitely better result. The Ionic order rests upon a surbase, itself resting on a low, square plinth, and so is raised considerably above the ground, and four of the columns are banded and wreathed; and though it is questionable whether representations of perfectly natural, unconventionalised wreaths is quite admissible, the effect is good. Both entablature and pediment are broken, as usual, without adequate reason; and two of the columns of the upper order appear to rest upon the slope of the pediment!



DOORWAY, CHATEAU DES IFS.—(*From* Sauvageot.)

Up to the present, the orders have rarely been found used constructionally in France; but this became gradually more common, first in small features (an example is illustrated in the charming little Doric wellhead at the Maison Fontaine-Henri), and then in larger ones. Of course, the Italian forms of the Roman orders were used, but the frieze was frequently deep, and the architrave

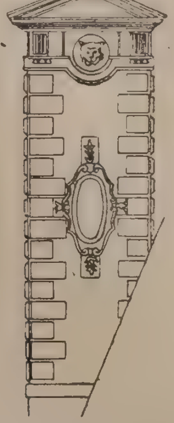
(*From a Photo. by* Mr. E. B. Drake.

narrow, while the cyma recta was almost invariably employed for the crowning member of the cornice, and the contours of the mouldings were invariably matter for careful thought, and of delicate, rather than vigorous, handling. The liberties taken with the capitals, too, when present at all, were less noticeable than they had been previously, and more formal. The Ionic capital from the Château de Joigny, for instance, is an original and beautiful variant; but it is not eccentric, neither is it overflowing with the exuberant fancy of the earliest work.



Chimney from the Chateau de la Ferté sous Jouarre.—(*From* Sauvageot.)

While the formal work of the Louis Quatorze period thus took the place of the eccentricities of that of Henri IV. in the greater features, there was an entirely new phase of ornament apparent in the smaller, known as Rococo. It was as a rule so gaudy in gold and colour, so intricate and voluptuous in design, as, in spite of the innate French capacity for rendering the most obnoxious features pleasing by the use of accurate proportions, to be little worthy of imitation or of illustration, especially as colour would almost invariably be needed to give the rich effect of the original. A small and unobjectionable example has therefore been selected in the scroll-inclosed panel upon the chimney of the Château de la Ferté sous Jouarre. Its character will be immediately familiar to everyone, as associated more with mirrors, picture frames and furniture, than with architecture; yet it is a development of Classic detail, and *can* be used effectively—as, for example, in the richly-gilt rederos in the cathedral at Worms, which lights up, with its glow of colour, that large and gloomy interior, adding a much-needed spot of light.

◆

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. W. D. Caröe, F.S.A., in the chair. On the usual proposition being made by the President that the names of candidates for membership be passed *en bloc*, a discussion arose, several of the senior members urging that the system was loose, and that in the list of nominations before the meeting the names of two gentlemen who were not architects were included, one being a teacher of architectural drawing at the Royal Academy Schools. The President remarked that the matter was entirely in the hands of the members. In the case specially referred to, the candidate was proposed by Mr. Alfred Waterhouse, R.A., and seconded by Mr. R. Phené Spiers. Messrs. H. Lovegove, C. H. Brodie, E. W. Mountford, Francis Hooper, and others having spoken, the proposal to take the names individually was withdrawn, and the following fifteen new members were elected without objection:—P. G. Silley, A. E. Willey, F. G. Lloyd, E. H. Morphen, F. Bond, W. W. Biss, F. C. Evans, J. Gamble, H. R. Groves, V. T. Hodgson, G. H. Jenkins, A. E. Nicks, G. S. Powell, J. H. Berner, and K. Biong.

ALTAR AND CANOPY, NORTH TRANSEPT, DOL CATHEDRAL.

Mr. B. Flight Fletcher, hon. secretary, announced that under the will of the late Mr. Ewan Christian, a number of valuable books had been presented from his collection to the Association library. A motion of thanks to the executors for their assistance in the matter was passed in silence.

A resolution was passed, on the motion of the President, regretting the proposed demolition of the ancient Trinity almshouses in Mile End-road, and requesting the Corporation of Trinity House to preserve the buildings if possible.

THE MUNICIPAL CONTROL OF BUILDINGS.

A paper on this subject was read by Dr. G. B. Longstaff, Chairman of the Building Act Committee of the London County Council. The questions were often asked, he said, Why should buildings be controlled by the Municipality? Do not those who build know their own business? Has not every man a right to do what he likes with his own? Is not the meddlesome interference of officialdom un-English, unpopular, and, in fact, an unmixed evil? There is, he continued, much truth in these suggestions. I am inclined to *laissez faire* as a sound general principle; but there is the conflicting principle to be taken into consideration that "circumstances alter cases." Where buildings are crowded together evils are but too apt to arise and to assume such proportions as to become sooner or later unbearable, so that ultimately the local authority has to step in and apply a remedy which, under the circumstances, may be difficult of application, unjust in its bearing upon individuals, and in any case is pretty sure to be costly. For example, cities and large towns must have some means of disposing of the excreta of their inhabitants, and of the large quantities of water fouled by the washing of their persons, clothes, and culinary utensils. This can be applied comparatively easily if the common works be carried out beforehand by or under the supervision of the local authority, and if the buildings be erected so as to comply with certain general principles of construction and arrangement. On the other hand, to apply a drainage system after the town is built will be more difficult, more costly, and probably not so effective. Yet even in such an obvious case as this the municipal control should be carefully regulated; it should be limited to general principles, and not enter into petty details of construction. The by-laws made by the London County Council under section 39 of the Public Health (London) Act, 1891, scarcely appear to fulfil this condition. But if those present had seen the first or even the second draft of those by-laws they would be filled with gratitude towards those who criticised them, and, in place of feeling aggrieved, would rejoice at the comparative freedom they are allowed. One reason which makes minute interference and precise regulations in such matters most undesirable is that it stops the way of experiment and so prevents possible improvements. The end to be aimed at may be definitely laid down, but not the means of obtaining it; on the contrary, the greatest possible latitude should be given to inventive energy. London legislation, wisely or unwisely, deals with drainage apart from other points of building construction. Assuming, then, that municipal control is desirable or necessary, and assuming also that such control should be limited in its scope, the first point to consider is in what respects it should be exercised. New buildings may be considered from the point of:—(1) Stability; (2) Fire; (3) Health; (4) Position and mutual relations; (5) Convenience; (6) Beauty. As regards stability, no one will object to the laying down of minimum thicknesses for walls, and of minimum scantlings of timbers, though it may be difficult to draw up a workable schedule for the latter. Also it will be agreed that sound principles of construction should be insisted on. Whether the provisions of the London Building Act err by excess or defect is for you to say rather than for me. It may be that some of its provisions dealing with construction, though they may not oppress builders, may serve no useful purpose; if so they are excrescences, and should be removed when opportunity offers. A good deal in this direction was done at an early stage of the Bill, but I regret that time did not allow of a more careful consideration of Part VI. before the Parliamentary Committees. However, architects well versed in the old law and the new will recognise that—outside Part V.—the new Act allows much more latitude. As instances in which this is the case I would quote Section 73, which permits, subject to certain limitations, the erection of bay windows and projecting oriels and turrets without the formalities and delay attending a special application to the Council. Also the second paragraph preliminary to the first schedule, which allows walls to overhang to the extent of 6in. Again, detached greenhouses, sheds below a certain size, and small cycle-houses can now be erected without special leave, or subject to less tiresome restrictions than before. Also section 54 deals with openings and recesses in a much more liberal way than the old Act, a point that will be especially appreciated by City architects. Lastly, the words added to sub-sections 11 and 12 of section 201, in effect greatly extend the number of detached suburban houses which will be wholly exempted from the Act. Fire affects buildings as regards their liability to burn when once set alight, the spread of fire from one building to another, and the escape from fire of their inmates. This part of the subject is one to which municipal authorities, as being also the fire-extinguishing authorities, naturally attach much importance. For this very reason it is a part of the subject which requires to be closely watched, as being specially liable to a pedantic and officious treatment. It is well known that regulations of the London County Council as to the structure of theatres are so onerous that it is now a matter of great difficulty to erect a theatre in London, and there is a tendency to apply these regulations to small buildings of a comparatively unimportant character, which it is difficult to suppose that the Legislature intended to be so controlled. The 74th section of the London Building Act, 1894, deals with the protection of life from fire; but I fear that it will be found in many cases unduly onerous. It is open to question whether buildings only ten squares in area should be in all cases so constructed that the part used for trade should be separated from the part used as a dwelling-house by fire-resisting structures; but this point was overlooked by the numerous opponents of the Bill. It is a matter of much regret to me personally that the projection of party-walls above the slates is still insisted upon, even in the smallest dwelling-houses, as not only is the rule strongly objected to by many architects, on both structural and æsthetic grounds, but because the evidence tendered to the House of Commons Committee was conclusive that this precaution is not required in the case of buildings used exclusively as dwelling-houses. On the other hand, that the new schedule of fire-resisting materials allows much greater elasticity than the old, will be appreciated by those who have to work under it. As regards health, apart from all questions of drainage and water-supply, the points that arise are the thickness of walls, damp-courses, and ventilation. The thickness of walls is mainly governed by questions of stability; but in the discussions that preceded the first drafting of the London Streets and Buildings Bill it was suggested that 9in. walls should not be allowed in any case for dwelling-houses. There is no doubt that such walls are objectionable; unless the best materials are used, they cannot be trusted to keep out the rain, and they are cold. As a fundamental principle underlying all building legislation, it should ever be borne in mind that, while it is comparatively easy to enforce a standard of excellence which admits of measurement by the 2ft. rule, it is practically impossible to prevent the use of inferior materials. Nevertheless, it will be admitted that, taking into consideration the great importance of cost, the Council was wise not to advocate the extreme measure of abolishing the one-brick wall. Whether it was wise in stiffening the schedule of thicknesses is disputed, and I was surprised that the first schedule was not gone into in committee. The schedule as it stands was the work of practical members of the Building Act Committee, and it was left for practical men to criticise it. The only suggestions in opposition came from one or two district surveyors who deemed the old rules sufficient. The question of damp-courses is not an easy one. Foundations and damp-courses in London are at present regulated by the old by-law under section 16 of the Metropolitan Management and Building Act Amendment Act, 1878. A great part of this Act, including section 16, has been repealed, but the by-laws continue in force under section 216 of the Act of 1894. This by-law, although it admits of amendment, allows considerable latitude of practice. The main reason for its existence is, that while speculative builders do not, as a rule, see the necessity for damp-courses, layers of concrete, and the like; after a wall has once been erected, a damp-course can only be inserted at the expense of much labour. Damp walls are no doubt unhealthy; without question they cause much trouble and annoyance to those who dwell within them. Mr. Stenning has pointed out that in so far as a layer of concrete beneath a building is designed to exclude emanations from the earth, it is more necessary in the case of a gravelly soil than in any other, yet the London by-law exempts gravelly sites! That this danger is a real one has been proved on more than one occasion by explosions of coal-gas in houses which have been traced to leaks in the mains under the impervious street pavements outside the houses. As regards ventilation, a sanitary requirement which comes even before drainage in importance, we can do no more than provide the means for it, and these should be the simplest. It is both wise and reasonable to insist that every habitable room shall have a window or windows bearing at least a certain proportion to the size of the room, and that at least half of the area of such windows shall be made to open. Certain attempts in some provincial towns to prescribe the height of the top of the window above the floor have not only proved destructive of all architectural proportion, but have produced ridiculous results. Indeed, next to the general use of Welsh slates, few causes have in this country contributed so much to the deterioration of the architectural effect of ordinary commonplace domestic buildings as the almost universal desire for lofty rooms and large windows, more especially in the upper stories. The picturesque windows of the 15th and 16th centuries, nestling close under the broad eaves, and often placed nearer to the floor than to the ceiling, are a thing of the past. But even as compared with the last century, the ordinary street house of to-day looks top-heavy by reason of the size of the windows of the upper stories. All must admit that the modern bedroom is better lighted and ventilated, and more habitable generally, than those of the old half-timbered houses of Kent and Sussex; nevertheless, while admitting this, it is open to doubt whether Sir Christopher Wren and his contemporaries did not go far enough in this direction. The question of the ventilation of buildings admits of an entirely different system of treatment. If any extreme advocate of economy still defend the system of "back-to-back" construction of houses, I would recommend him to make an architectural tour of the Scotland ward of Liverpool, so called, I presume, from the fact of its inhabitants being almost exclusively Irish. This system reached, in fact, perfection in Liverpool about half a century ago. An ideal plan having been invented, it was repeated wholesale; the resulting evils proved ultimately intolerable, and enormous cost was imposed upon the town council in its efforts to remove them. It is not surprising, therefore, that Liverpool has led the way in preventive legislation. The prevention of the erection of back-to-back dwellings is but one case of the general question of the position and mutual arrangement of buildings. Legislation in this matter is of quite first-rate importance in its bearing on the public health; it is also beset with the greatest difficulties on account of its interference with the rights of property. There is also a peculiar difficulty which needs to be emphasised; it is this: A lofty building does not interfere much, or perhaps at all, with its own light and air, but it may interfere with the light and air of its neighbours to almost any extent. No law yet enacted and no by-law yet in force has boldly faced this difficulty. A building proposed to be erected, whether it be itself dwelling-house or counting-house, stable or factory, may equally smother a cottage now existing on the adjoining plot, or to be erected thereon in the future. It follows logically that any regulations which it may be deemed expedient to enact prescribing the height of buildings and the open space about them, should be applicable to all buildings, regardless of the uses to which they may be put. It is, however, doubtful whether Parliament would sanction such legislation. Hence we are driven to such compromises as legislation dealing with dwelling-houses only, or "domestic buildings." At first sight such a compromise may seem to be a satisfactory conclusion; but to the inhabitants of a long row of cottages, with very limited backyards, it will appear less so. Picture to yourselves a row of six cottages having behind them small backyards, which, in their turn, are separated by a wall from a strip of vacant land 40ft. or so in depth, and abutting upon a street parallel to, and at the rear of, the six cottages. Two building-owners purchase this vacant land —A. who has purchased one-third of the frontage, erects thereon two cottages, and the law compels him to leave a certain space at the rear of them, and consequently adjoining the backyards of two of the old cottages. The provision of this open space may be a very serious matter to A., and may greatly detract from the value of the site he has purchased, but it has the wholesome effect of preventing any very material interference with the light and air of the old cottages, although the erection of the new buildings (or, for the matter of that, of any new buildings) may spoil the view from the back windows. B., warned by the experience of A., or having other views as to the investment of his capital, erects on his plot—the remaining two-thirds of the frontage—a warehouse or factory, and so doing is not compelled to leave any of his land vacant; on the contrary, he covers the whole of it with a building 60ft. in height, which may no doubt bring him in a considerable rent, yet by his act he will have made the back rooms of four of the old cottages unfit for human habitation! Some will no doubt say, "How about ancient lights?" My reply is that the building-owner B. may be compelled to pay a sum of money, possibly a considerable sum, to the owner of the old cottages; but there is no law to compel the giving of any portion thereof to the tenants of the same, nor is there the smallest reason to believe that they will get any benefit out of the transaction; certainly they will get no compensatory light and air. There is, however, another course open to B. He may buy the old cottages and continue to let them as before, while the demand for houses will probably prevent any material fall in the rents. From this instance it is plain that the compromise of the present law fails alike to secure justice as between individuals and the end primarily aimed at. I am still of opinion that the angle of 45° as enforced in Liverpool in the case of buildings on new sites is not an unreasonable one, and I would urge on those who deem it excessive to take the first opportunity of inspecting some of the many houses erected in conformity with that angle in the newer parts of Liverpool. Apart altogether from the sanitary aspect of the case, the greatly-increased traffic of the modern town demands far wider streets than formerly sufficed. Sir Thomas More doubtless thought he was acting very liberally when he laid out the towns of Utopia with streets 20ft. wide; but he went somewhat beyond the London Building Act in that he provided all the town houses with gardens at the back in which were grown vines, fruits, herbs, and flowers. The houses were three stories in height; the materials were such as to resist the action of fire, and the line of frontage seems to have been very strictly observed, so that, as he tells us, "The buildings . . . are so uniform that a whole side of a street looks like one house." Three centuries and a half have achieved streets double the width thought ideal by More, but three centuries and a half have played sad havoc with his back-gardens! Part V. of the London Building Act, though deemed by many to be over-stringent and exacting, scarcely allows of open space at rear sufficient to admit of the successful cultivation of vines, fruits, herbs, and flowers. It has often been remarked that whereas in the present day house-builders seek out exposed and breezy sites, the men of old time preferred sheltered valleys; it is all of a piece with this practice that we find the streets of Utopia described "as very convenient for all carriage, and well sheltered from the winds." If the gospel of fresh air and the gospel of expediency have done much to exclude the picturesque from modern towns, is this not an additional reason for exerting ourselves to the utmost to preserve what is left to us of the works of our forefathers? As regards the internal convenience of buildings, all will be agreed that any control would be quite out of place. The quality of beauty is, of all others, perhaps that which modern buildings least often possess. Whatever may be the position of British architecture at the present day, the vastly greater portion of the buildings put up are built by men who, whether they call themselves builders, surveyors, or architects, deem architecture an expensive luxury, well enough, perhaps, for churches and town-halls, but a thing wholly divorced from the more numerous buildings in which folk have to live or to earn their living. The general neglect of architecture—meaning, thereby, the fine art—not merely by the builders but by the general public, is a great misfortune to the country, and one not easily accounted for. Yet architecture, above all arts, binds us to the past, so that even a superficial knowledge of it, provided that it be accurate, not only adds vastly to the interest of history, but materially facilitates its study. The importance of architecture cannot, indeed, be overestimated, and the argument is strengthened if it be kept in mind that we are from day to day becoming more and more a nation of dwellers in cities. In proportion as we are divorced from all contact with Nature, in proportion, alas! as modern "Progress" too rapidly destroys so much of natural beauty, so are we made more and more dependent upon such beauty as Art can give us in substitution for that which is lost. Admitting, then, that beauty is a quality in buildings which is of supreme importance, and that outside comeliness pre-eminently concerns those who do not dwell within, is it a matter for municipal control? I think it is not. To begin with, the greatest latitude should be left to architects as regards design, whereas any system of municipal control would be apt to hamper the noblest efforts of genius, and at the same time would tend to strengthen the tyranny of the prevailing fashion of the day. *Quis custodict ipsos custodes?* What one man deems beautiful another calls hideous, and I am by no means sure that this is less true of architects themselves than of vestrymen or county councillors. The hanging committee of the Royal Academy does not give complete satisfaction; could better results be expected from a committee of design? Nevertheless, I have been an active advocate of a certain amount of control of an æsthetic character. I do not allude to the case of the County Council as a land-owner approving the designs of buildings erected on its property by leaseholders, although in one such case I was partly instrumental in preventing the erection on a prominent site on the Thames Embankment of a building which would have marred irretrievably one of the finest prospects in London. This is a special case in which the Council acted as landlord rather than in its municipal capacity. But modern civilisation, with perverse ingenuity, has devised certain excrescences upon buildings which serve no useful purpose that I ever heard of, and which no Goth or Philistine will be hardy enough to claim as ornamental—to wit, sky-signs. This Association, at any rate, will not object to a municipal control tending to their ultimate extinction. A single advertising board judiciously placed upon the top of a building may vulgarise a whole street. To the end that one man may increase his income in a not very honourable way the purpose of vast outlay in public buildings may be thrown away. As regards design, my view is that the municipality should, on the one hand, take care that its regulations interfere as little as possible with the efforts of the artist, but that it should do its best to protect him from extraneous foes. I have endeavoured very imperfectly to indicate the principles which should underlie the municipal control of buildings. It is perhaps rather in the application of those principles than in the principles themselves that differences of opinion arise. Before long it will probably be necessary to go to Parliament once more, not so much to strengthen the hands of the Council as to remove ambiguities or inconsistencies in the law which practice has brought to light. In some cases amendments introduced in committee by irresponsible opponents (and not always expressed in the clearest possible manner) have led to inconsistent or even absurd results. In some cases provisions which have proved to be more far-reaching than was intended may need modification. But be this as it may, I feel sure that any representations made by this Association to the Council would receive the most careful consideration, and prove of great assistance in the drafting of any amending Bill.

In proposing a vote of thanks to the lecturer, Professor Kerr paid a tribute to the broad view Dr. Longstaff had taken of the interpretation of building enactments, both in his paper and as chairman of the Building Act Committee of the L.C.C. The provisions of the new Building Act of 1894 were in many cases, as the lecturer had admitted, vague, but the intention was always clear. He held that the County Council were well advised by their staff of practical architects, who acted as district surveyors, and were therefore entitled to the confidence of the public. As to the suggested amendment of the new Building Act, he hoped the Council would not be too precipitate in taking action, for with the aid of moderation, intelligence, and kindness on the part of district surveyors, it could be made to work well.

Mr. Richard Roberts, L.C.C., in seconding the motion, said the new London Building Act was not an easy measure to administer; but Dr. Longstaff was neither an architect nor a builder, and therefore could arbitrate in an impartial manner. As for the ugliness of London, it was not due to the profession, for the majority of the buildings had neither been designed by architects nor erected by builders, properly so called. Several clauses of the new Building Act were not, he confessed, very workable. It was a curious thing that the famous clause 74, dealing with the separation of dwellings from trade premises, slipped in without any objection being raised by the Institutes of Architects or Surveyors or the Association.

Mr. R. H. Lovegrove said it would be well for builders and the district surveyors of London if a decision could be obtained in a high court on a well-devised case dealing with the interpretation of Clause 74.

Mr. E. Woodthorpe suggested that it would be well in an amended Act if some clause were inserted dealing with the classes of stone to be employed. Stones were now used for cornices, from which fragments broke off after every frost.

Mr. Marsden did not think Clause 74 was otherwise than fair and reasonable.

Messrs. Bernard Dicksee, Francis Hooper, and F. T. W. Goldsmith also supported the vote of thanks, which was cordially passed, and was briefly acknowledged by Dr. Longstaff.

NOTES ON APPROXIMATE ESTIMATES.*

EVERYONE actively engaged in the design and superintendence of building or engineering works has doubtless at some time or other been called upon to submit approximate estimates for some proposal which it is desired to carry out.

As a measure of ordinary prudence, the client will desire to know the probable cost of any proposed undertaking. Frequently a preliminary estimate must be prepared before any definite instructions will be given respecting the preparation of a design or specification. Even when the drawings and specification have been prepared, a more or less detailed approximate estimate is generally asked for before the order for the execution of the work is given. In many instances it is also stipulated that the total cost of the proposal must not exceed a given amount, so that the design may be arranged accordingly.

Under any of these circumstances, the possession of suitable data for the calculation of the probable cost, together with a knowledge of the different methods by which appoximate estimates may be prepared, is found to be of the utmost value. Especially is this the case if an estimate is required at short notice, when the architect or engineer is compelled to rely on any sources of information he may have at hand.

Most architects and engineers have collected from time to time various notes and data—more or less complete—for use in such emergencies. It is hoped, however, that the following observations on the methods most generally adopted in the preparation of approximate estimates will prove of service.

I.—*The cubical contents, together with a general idea of the materials and finishings required, being known, the cost per cubic foot is estimated from the ascertained actual cost of constructing similar buildings or works.*

This is the best known and most usual method of preparing an approximate estimate for ordinary buildings or works, and with the exercise of due care in calculating the price per foot cube at which they shall be taken, very accurate results may be obtained.

If the description of materials or workmanship varies for different portions of the same building or work, then each portion should be priced separately according to their relative values. For instance, the value per foot cube of the outbuildings or domestic offices of an ordinary mansion would be much less than that of the main portion of the building. Any small turrets, towers, or other ornamental features should also be kept separate, and priced at a higher rate.

The cubic contents of a building, for the purposes of an approximate estimate, is usually obtained by taking the dimensions from out to out of walls, and from the bottom of the footings to half-way up the roof. Another practice is to consider the cubic contents as obtained by taking the dimensions from out to out of walls, and from half the depth of the footings to half-way up the roof. Personally, however, I prefer to obtain the cubic contents in the way first mentioned, and to price in accordance therewith.

II.—*Taking out rough Quantities, according to the varying materials and workmanship required; but at the same time concentrating the work as much as possible into a few specific items, and pricing them accordingly.*

Although the course indicated above is perhaps less generally used than any other for the purpose of making approximate estimates, yet it is undoubtedly the most reliable method that can be adopted. The fact that it is not more often used may be due in a great measure to the want of a readily accessible table of prices for the different groups of materials and labour. Slightly more time is also required for this purpose than when the cost is arrived at from the cubic contents or any other of the methods that will be mentioned. The final result, however, is much more satisfactory.

When rough quantities are being taken out for an approximate estimate, it is desirable for ordinary purposes that the various descriptions of materials and workmanship should be grouped together so as to form as few separate items as possible; also, in all cases where it can be done, the items should be priced at per square of 100ft. superficial, for the sake of uniformity and convenience.

The walls should be classed according to their materials and thickness, also whether external or internal. Each item should, however, include all necessary digging, footings, doors, windows, and finishings of wall surfaces, such as plastering, papering, facings to external walls, &c., so that the item, and consequently the price, shall be inclusive of everything that appertains to the various inclosures or divisions of the building.

---

* All rights reserved.

For this purpose the superficial area of the walls should be obtained by taking the extreme length of each wall by the height from the bottom of the footings to the eaves, in cases where the wall is of the same thickness throughout. Should the wall vary in thickness, either in its length or height, each portion should be measured separately. No deductions must be made for door, window, or other openings. Bay windows, chimney flues, and other additions of a like nature should be numbered and priced according to their materials and workmanship.

The floors must be dealt with in a similar manner as described for the walls. The ground and upper floors must be kept separate, and classed according to the materials and finishings required. The item for wood floors on the ground floor, to include sleeper walls, joists, boarding, hearths, &c., together with a layer of concrete on brick rubbish over the whole area, and all necessary digging for same. Similarly, concrete or other floors will include all materials, labour, and finished surfaces that may be required. The upper floors to be treated in a similar manner. The item to include all joists, boarding, hearths, ceilings, cornices, and whitening or colouring to same.

The roof-coverings to be measured on the slope, the item being inclusive of roof-trusses, rafters, boarding, slating, leadwork, eaves-gutters, down pipes, &c. Ceiling-joists, ceilings, and whitening to ceilings will also be included in the same item where required.

Drains, gas and water-mains, and items of a similar nature, should be taken at per foot run, according to sizes, and including all necessary digging, laying, filling, and removal of surplus materials. Manholes, disconnecting pits, &c., to be numbered and priced according to size and average depth.

Staircases to be taken at per step, or per foot in height, classed according to their widths, and the nature of materials and finishings. Gas and water fittings to be priced at per light or per tap, including all service-pipes from mains, diggings, &c.

Fitments or furnishings generally, such as cupboards, baths, sinks, w.c.'s, kitcheners, grates, mantels, &c., should be numbered and priced, according to the class of fitment, material, and finishing required.

A series of average items and prices, adapted for this method of calculating approximate estimates, will be found in the tabulated list of data and prices compiled for use with these notes.

III.—*The superficial floor area of the building or work being known, the cost per square of* 100*ft. superficial may be estimated from the average cost per square of similar work already executed.*

Under some circumstances it is convenient to prepare approximate estimates by this method; but its use is generally confined to one-story buildings, such as schools, churches, chapels, bungalows, &c. It may, however, be used for buildings two or more stories in height; but in all cases where this course is adopted, a considerable amount of discrimination and care must be exercised, in order that the final result may be relied upon.

When estimating in this way, the superficial area is obtained by taking the dimensions from out to out of walls. Where the materials, workmanship, or height of the building or floor varies, each description or height must be kept distinct, in order that they may be separately priced.

In the case of one-story buildings, the price per square includes foundations, wall, roof, and all finishings. In two or more-story buildings, the ground floor is taken to include foundations, floor, walls, ceiling, and all finishings. Upper floors include floor-joists, flooring, walls, ceilings, finishings, &c., whilst the top floor includes the roof covering in addition. It is usual, however, in the case of two-story buildings to price both floors at the same rate, as it is found that the average cost of the ground floor, including the foundations, is about the same as that of the first floor, which includes the roof covering.

IV.—*Given the accommodation or requirements of the proposed building or work, the approximate cost may be obtained by pricing the same at the ascertained average cost per unit of similar accommodation or requirements.*

In practice, it is found that for certain descriptions of buildings or works constructed under normal conditions, the cost of such buildings or works varies (within certain limits) in a direct ratio to some known unit of accommodation or requirements. For such buildings as hospitals, schools, &c., the cost can be approximately given if the number of patients, children, &c., required to be accommodated is known. On occasions when time will not admit of even a sketch of the proposal being made, this method affords oftentimes the only ready means of ascertaining the approximate cost. Similarly, for certain minor accessories, where the cost of materials and construction varies but slightly for units of the same class, as in a range of latrines, &c., the approximate cost can be accurately determined in this manner.

Where time allows, a useful check in the preparation of approximate estimates is to calculate the cost by two or more of the methods mentioned, in order to insure that no serious discrepancy may afterwards be found.

In connection with these notes, a tabulated list of prices and data on which to base approximate estimates has been compiled. The various items are arranged alphabetically, and also numbered for ready reference. Such items and prices may require modification, according to the local circumstances of each specific case. Peculiarities of design, accessibility of situation as regards transport of material and supply of labour, character of materials and finishings required, local rates of labour, and many other considerations must be taken into account and due allowance made, if a fairly accurate approximate estimate is desired.

The buildings and works to which these items and prices refer are assumed to be of brick (unless otherwise stated) of normal design, and built under ordinary conditions. For stone buildings of the same class, from 10 to 20 per cent. should be added to the prices, according to the locality.

CIVIL BUILDINGS, WORKS, &c.

	Average Cost.		
	Per foot cube.	Persquare of 100ft. super.	Per unit.
1. Ash-bin. Cast-iron, 4ft. by 3ft. by 3ft. 6in., with wrought iron lid, &c., fixed complete, including concrete base, digging, &c.	—	—	£9 each
2. Assize Courts	10d.	—	—
3. Asylums, Lunatic, including administrative buildings ...	6½d.	—	£150 per lunatic
4. Balconettes. For windows of upper floors, complete ...	—	—	£10 each
5. Balconies. (See "Verandahs")	—	—	—
6. Bandstands. Iron, complete, 24ft. diameter, and 12ft. high to eaves	—	—	£180 each
7. Baths. For private houses. Enamelled iron, with brass fittings, mahogany inclosure and top, fixed complete, including lead waste, overflow, &c., but exclusive of water supply	—	—	£20 each
8. Billiard Room, complete, except table	8¼d.	—	—
9. Board Schools. (See "Schools")	—	—	—
10. Breakwaters. Formed of concrete blocks below low-water mark, and of concrete *in situ* above low-water mark	—	—	25s. per yard cube
11. Breakwaters. Formed entirely of concrete deposited *in situ*. 7 parts sand and gravel to 1 part Portland cement	—	—	23s. per yard cube
12. Breweries	6d.	—	—
13. Bungalows, residential	7d.	£55	—
14. Canals, as constructed in England	—	—	£9,000 per mile
15. Ditto in Scotland	—	—	£11,000 do.
16. Ditto in Wales	—	—	£5,500 do.
17. Ditto in France	—	—	£8,000 do.
18. Ditto in United States	—	—	£5,000 do.
19. Cess-pits, not exceeding 12ft. deep, including digging and steining, with half-brick sides in cement, stone cover, &c., 4ft. internal diameter .	—	—	10s. 6d. per ft. in depth
20. Ditto 4ft. 6in. ditto	—	—	12s. ditto
21. Ditto 5ft. 3in. ditto	—	—	16s. ditto
22. Ditto 6ft. 0in. ditto	—	—	20s. ditto
23. Chambers. (See "Offices")	—	—	—
24. Chapels. Ornamental	—	—	£8 per sitting
25. Ditto Plain	—	—	£5 ditto
26. Churches, including tower, Ornamental	7½d.	£170	£15 ditto
27. Ditto ditto, Plain	6d.	£120	£10 ditto
28. Ditto Iron (200 to 400 sittings)	—	—	£2 ditto
29. Ditto ditto (400 to 700 sittings)	—	—	£3 ditto
30. Cisterns. Wrought iron, galvanised, fixed complete, including wood cover, &c., but exclusive of water supply, 50 gallons	—	—	£3 10s. each
31. Ditto ditto, 100 gallons	—	—	£5 each
32. Ditto ditto, 200 gallons	—	—	£7 each
33. Ditto ditto, 500 gallons	—	—	£12 each
34. Ditto ditto, 800 gallons	—	—	£15 each
35. Conveniences. Public, underground, as constructed in London, and comprising urinals, w.c.'s, and lavatories	—	—	£60 per urinal, w.c., or lavatory
36. Corn-Bin. Wrought-iron galvanised, with padlock, &c., fixed complete	—	—	£5 each.
37. Cottages. (See "Mansions or Houses")	—	—	—
38. Cow-houses complete with fittings	3½d.	£22	£17 per stall
39. Cow-houses, iron fittings for, comprising iron trough, fodder-rack, fastening-rods, heel-post, and dwarf division complete, including fixing	—	—	£6 per cow
40. Drainage. Arterial system as for towns, but exclusive of cost of works for treatment or disposal of sewage	—	—	25s. per head of population, or 6½d. in the £ of rateable value.
41. Drainage, disposal of. (See "Sewage")	—	—	—
42. Drainage of Land. Heavy clay soils	—	—	£6 10s. per acre
43. Drainage of Land. Medium soils	—	—	£5 per acre
44. Drainage of Land. Light sandy soils	—	—	£3 10s. per acre

45. Analytical Table of Average Cost of Land Drainage per Acre.

Description of Soil.	Distance of drains apart.	Depth of drains.	Cost of drain-pipes per acre.	Cost of cutting, laying, and filling per acre.	Total cost, per acre.
Heavy Clay.	ft.	ft. in.	£ s. d.	£ s. d.	£ s. d.
Stiff, heavy clay	16	2 9	4 0 0	3 15 0	7 15 0
Stiff, adhesive clay	20	3 0	3 13 0	3 6 0	6 19 0
Friable clay	24	3 3	2 15 0	2 10 0	5 5 0
Medium Soils.					
Clayey loam	27	3 6	2 8 0	2 4 0	4 12 0
Gravelly loam	30	4 0	2 3 0	3 4 0	5 7 0
Porous or Light Soils.					
Light, gravelly loam	35	4 0	1 18 0	3 2 0	5 0 0
Sandy loam	40	4 0	1 12 0	2 0 0	3 12 0
Light, gravelly sand	50	4 3	1 7 0	2 5 0	3 12 0
Coarse, gravelly sand	60	4 6	1 1 0	2 4 0	3 5 0

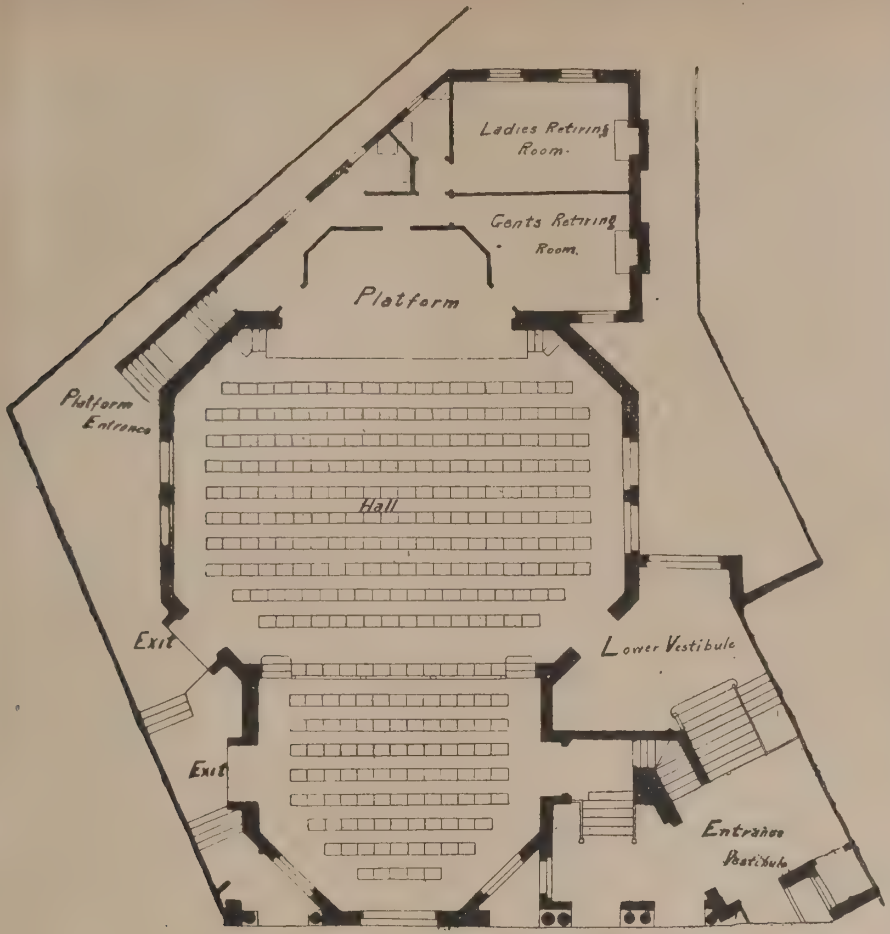
(*To be continued.*)

CONCERT HALLS AND ASSEMBLY ROOMS.—VI.

By Ernest A. E. Woodrow, A.R.I.B.A.

I HAVE now to consider the assembly hall of the small towns or suburbs, and I take as an illustration, by permission of the architect, Mr. Henry G. Brace, F.R.I.B.A., an example lately erected from his designs of a small suburban hall in Lordship-lane. Everybody knows to what purposes a suburban hall is put, and how frequently it is used for private dances by persons who either have not a room in their own house large enough for the purpose, or who do not care to disarrange their house by turning it inside out in order to clear the floor space. A small and comfortable hall is what is needed in this case. The other usages of the suburban assembly hall are on much the same lines as those which I have already laid down in dealing fully with the parochial rooms: the letting is subjected to the same daily and constant change from theatricals, balls, concerts, lectures, meetings, dinners, to Sunday services, &c.

What I have said about interior fittings for the various purposes in a former chapter equally applies here. There is, however, a slight difference from the parochial hall with regard to its surroundings in the class of building we are now considering, which difference arises from the fact that the suburban hall has so frequently to be a substitute for the home, and should, therefore, have more home comforts. Naturally all public halls should be kept perfectly free from draughts; but we may expect in this case that special care should be taken by the architect to avoid this, for should any of the guests, when heated by dancing, catch cold from the effects of a draught of cold air, and the hall become notorious for its defects, the lettings would at once diminish, as a host would never think of subjecting his friends to this danger. Swing-doors should be placed in as many places as possible: in every passage way, corridor, or vestibule, so that they could not all



be open at once and admit the cold night air into the dancing room. Where the hall is on the first floor, the swing doors should be at the foot and the top of the staircases; but they should not be immediately in line with the step. This is dangerous, and might cause a fall down the staircase by a person coming unexpectedly upon a step. There should be a square landing between the doors and the first step in every case.

The cloak-rooms are most important features in buildings of this character. They are too often treated as afterthoughts. Given a plot of land of a certain size, the architect too frequently is over-anxious to get a hall as large as possible upon the land, and therefore curtails the adjuncts to the detriment of his scheme. Cloak-rooms are placed in positions quite regardless of their use, and of the fact that they are the first places the guests have to go to on their arrival. Ladies' and gentlemen's rooms are placed in close proximity, and in conspicuous positions, so that guests, especially ladies, hesitate to go to them during the course of the evening. While cloak-rooms should be near to the entrance vestibule, they should not be placed so that a crowd collecting in the vestibule would prevent the people reaching the doors who had their cloaks and wanted to leave, nor should the people waiting in the vestibule obstruct the way to the cloak-rooms from the part of the audience who wish to get their wraps. Where room permits, it is well to have a way into the cloak-room from an internal corridor, and a second door to serve as a way out, leading directly into the vestibule, so that the people can move in a stream from the dancing-room into the corridor through the cloak-room to the vestibule.

The fitting up of the cloak-rooms is also an important matter; separate numbered bins for each guest should be provided, and the hats and coats should be given by the attendant over a counter. Lavatory, washing, and other accommodation should, of course, be provided in both ladies' and gentlemen's retiring rooms.

As to the relative positions of the ladies' and gentlemen's rooms, it is well to have the one on the right, and the other on the left; and where the cloak-rooms have two doors, one to the vestibule and one to the corridor, the ladies and gentlemen could, after parting in the vestibule, meet again in the corridor before passing into the dancing-room to be received by their host. There is another advantage in such an arrangement: When waiting for one another in the corridor before entering the hall, the guests are not loitering in a cold draught, as in the vestibule, where the doors are constantly being opened upon the arrival of fresh guests.

A German writer upon the subject which we are now considering, gives some useful measurements, which I will now repeat. He says that, in cloak-rooms, for every 100 persons the receiving-table or counter should be 6ft. 6in. long, and this measurement should be considerably increased if the dressing-space of the cloak-room is not ample. The space behind the counter should be 9ft. deep, and the area 26ft. 3in. for every 100 persons.

It must not be forgotten that refreshments other than of the "light" kind are needed in premises where dances do not terminate till the small hours of the morning. A supper-room must, therefore, be provided, and the size of it must be governed by the number of people that the hall will accommodate for dancing.

In addition to the supper-room, there should be a room for light refreshments between the dances, and this should be near the hall, reached without having to go into air colder than that of the dancing-room. In fact, a recessed portion of the hall itself is a most suitable location for such a purpose. A smoking-room for gentlemen is also a desirable addition.

The floor-space allowed for each dancing couple should be rather over 6ft. 6in. square, and when the non-dancers stay in the hall this area should be considerably increased. The floor should, of course, be laid specially for dancing, with smooth polished surface. I may have to speak further upon the construction of dancing-floors, when dealing with another class of room.

Where suppers are served, it is very desirable to have a kitchen in connection with the premises; but its position should be studied, having regard to the risk from fire. Caretakers' living-rooms and bedrooms are also frequently needed in suburban assembly-halls, for, as a rule, the caretakers act as servants and attendants to all who hire the premises. Coal-cellars and such-like adjuncts should not be forgotten.

An all-important item is the heating and ventilating. The heating apparatus should be of such a character that the temperature of the room could be regulated to a nicety. It is most damping to one's enjoyment to enter a hall of this class at the beginning of the evening, and to feel it strike cold. After two or three dances, complaints are, however, often made that the room is too warm. The heating apparatus should therefore be so under control that the room may be warmed at the beginning of the evening, and kept at a lower temperature some short time after. The heating-chamber should be separated structurally from the rest of the building to prevent any danger arising from fire. The London County Council insist upon this provision in the Metropolis.

The musicians must not be forgotten. A minstrel gallery should therefore be provided. Sometimes a gallery exists in the hall, and this is used; sometimes the band is placed on the platform. This latter course, however, is a disadvantage; it places the musicians too near the dancers, and robs the space which is useful for people who like to sit out and watch the dancers. The platform, too, is frequently for the reception of the guests by the host; this, however, entirely depends upon the position of the entrance and cloak-rooms in relation to the platform.

Where a hall is put to many usages, the retiring or dressing-rooms behind the platform can with economy be so arranged as to serve for cloak-rooms, or be used for other purposes, as refreshment or smoking-rooms, when the hall is used for dances.

It may be supposed that, as the majority of the guests will arrive in carriages, therefore care should be taken to plan the entrance so that the people can step out of their carriages under cover. This is seldom the case in suburban assembly-rooms; but such a simple provision would add greatly to the comfort of those frequenting the hall.

ART FOR SCHOOLS ASSOCIATION.

THE exhibition just opened at 29, Queen-square, Bloomsbury, in connection with this association, contains a large collection of framed and unframed pictures specially selected for school prizes, Christmas presents, &c. The Art for Schools Association has, in this as in former exhibitions, aimed at a high standard of subject and artistic merit. Many of these are small framed pictures in black and white and colour at very moderate prices, ranging from 1s. 6d. to 10s., and suitable for prizes. This association, founded in 1883, is doing admirable work in promoting an artistic taste among our scholars, and in reproducing masterpieces of art. The object which it promotes are fourfold; (1) to negotiate with art publishers for the purchase of engravings, photographs, etchings, chromos, &c., on advantageous terms, and supply them at reduced prices to schools; (2) to reproduce works of art for schools, and publish the same at the lowest prices; (3) to lend groups of framed engravings, &c., to poor schools; (4) and to assist in promoting oral instruction explanatory of works in our national collections, &c. This exhibition bears ample testimony to the carrying out of these intentions. Masterpieces of Fra Angelico, G. Bellini, Botticelli, Michael Angelo Buonarotti, Albrecht Dürer, Giotto, Georgione, A. Mantegna, Fra Fillippo Lippi, and other old masters are represented. Of these we may single out the following:—"A Madonna and Child," by Angelico—a photograph, price 2s. 3d.; "The Adoration of the Shepherds," by G. Bellini (an autogravure); a series of photos and autotypes from Michael Angelo's works; a heliogravure of Raphael's "Madonna degli Ansidei," £1 14s., published by the Association; and a fine reproduction (heliogravure) of Hans Memlinc's "Visit of the Magi," also published by the Association. Of English masters we have several good reproductions, in photography and autotype, of Constable—"The Cornfield," "Salisbury Cathedral," and "The Glebe Farm," all well-known subjects. Gainsborough's portraits of Mrs. Siddons and Miss Linley," and Sir Joshua Reynolds's portraits of "Lady Cockburn and her Children," "Georgina, Duchess of Devonshire," "The Strawberry Girl," &c., most of these in autotype. Geo. Romney's "Mrs. Jordan as Euphrosyne." Of later masters we notice some beautiful photos of Dante Gabriel Rossetti's works, as his "Proserpine" and "The Loving Cup," several autotypes and chromos of Turner's works, and one or two inimitable examples representing G. F. Watts, R.A. His charming little figure subject, "Good Luck to your Fishing," a photographic reproduction of a red-chalk drawing, is very good. Other painters' works reproduced are those of S. Prout, as the autotypes of "Abbeville" and "Strasburg"; Sir J. E. Millais, Bart., R.A., Miss Clara Montalba, Henry Moore, R.A., J. J. Shannon, and several other well-known painters are represented by examples, many of the prices of these reproductions being exceedingly low. The series of chromolithos of flower studies in colour published by the Association are particularly useful as a series for schools and classrooms, and the autotypes of historical portraits they have published are very interesting and instructive. The supply and reproduction of works of acknowledged excellence in this manner cannot be esteemed too highly, and if these were the only works of the Association, it would deserve public encouragement.

THE TRINITY ALMSHOUSES, MILE-END-ROAD.

MR. G. S. MURRAY, Assistant Commissioner to the Charity Commissioners, opened an inquiry on Wednesday, in the Board-room of Trinity House, into the administration of charitable endowments by the Brethren of Trinity House, the proposed demolition of the almshouses in the Mile End-road being one of the matters considered. Numerous societies and public bodies were represented in opposition to the removal of the almshouses, including the National Trust, the Society for the Protection of Ancient Buildings, the Commons Preservation Society, the Greater London Survey Committees, the Kyrle Society, and the Royal Institute of British Architects, the latter body being represented by Mr. F. C. Penrose, president, and Mr. J. MacVicar Anderson, past-president. A letter was read from Sir F. Leighton, President of the Royal Academy, stating his inability to attend on the ground of ill-health, but strongly deprecating the proposed destruction of "the most delightful and characteristic group of buildings which is menaced." Evidence was given by Mr. Leisching, secretary to the Pensions and Estates Department of the Trinity Corporation, it being admitted that structurally the buildings were in good condition, although certain internal sanitary defects existed. Eight houses were first built in 1692, but four years later were pulled down, and 28 houses were erected. The estimates were that £225 would have to be spent upon the 28 houses, £369 upon the other houses, and if new drains were called for, as they might be, a further £1,825, making a total of £2,416. The vestry has been holding its hand pending the final decision of the board, who had, in fact, adopted the principle of abolishing the almshouses long before the sanitary question was raised. The inquiry was adjourned.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A SPECIAL general meeting for the election of two pensioners took place on Tuesday evening, the 26th November, at the offices of the charity, No. 21, New Bridge-street, Blackfriars, Mr. E. C. Roe (Messrs. Geo. Trollope and Sons) presiding, in the unavoidable absence of Mr. Chas. Wall, the president.

The election was a contested one, there being three candidates—viz., Mrs. Sophia Lovett, who polled 1,014 votes, Mrs. Helena Bishop polling 916 votes, and Mr. J. T. Gough 114 votes. At the close of the poll the chairman announced that the successful candidates were Mrs. Lovett and Mrs. Bishop. The amount of the widow's pension is £20 per annum, and there are now (including the two widows just elected) twenty pensioners on the books. Votes of thanks were passed at the close of the election to Messrs. James Aynsley (Messrs. Carter and Aynsley), H. W. Parker, and James A. Robson for their services as scrutineers, and to Mr. E. C. Roe for his able conduct in the chair.

COUNTY LUNATIC ASYLUMS.—XXXIV.

By George H. Bibby, F.R.I.B.A.

DISTRICT ASYLUMS ABROAD AND AT HOME.

IN my last paper attention was directed to a type of asylum which has been found suitable for the climate of those portions of North America where the variations of temperature are far greater than in this country. In the case of one modern American asylum the authorities in their annual report state: "The advantages of the cottage system and non-restraint treatment of the insane is illustrated by the operations of our asylum during the past year, while, as we have shown, the cost of our plant is about one-third of the one-building plan, we continue to show that the expenses of maintaining our institution are materially less. We have been even generous in the quantity, variety, and character of the supplies for the treatment of our patients." It must be remembered that the extreme cold during the winter makes the heating and ventilation of a large asylum a very difficult matter to contend with. It has been found that the separated asylum cottages for 50 patients may be erected for about £3,000 each, to which must be added a fair proportion of the administrative buildings, when the actual cost of the whole institution (per patient) can be ascertained; but, from the figures before me, it would appear that the Americans expend per patient at least as much as the English upon their asylums. In Australia, it will be remembered that no such difficulty as extreme cold is offered against asylum heating and ventilation, the conditions of climate being wholly different.

In Fig. 51 is given a general block plan plan of a large hospital for the insane at Callan Park, Sydney, New South Wales, which, it will be at once perceived, bears a far stronger resemblance to an English asylum than to the American asylum as illustrated in Fig. 50 in my article No. XXXIII. of this series.

In this plan, A, B, C, H, I, J indicate blocks of building for male and female patients respectively, each having on the ground-floor, day-rooms, single rooms, and various necessary apartments similar to those provided usually in British asylums, while on the upper floors dormitories are arranged with two staircases for exit in the event of panic or fire; but the single rooms on the upper and lower floors are placed off isolated corridors, instead of communicating directly with the day-rooms or dormitories. The letters D E F G indicate the position of the hospital day-rooms and single rooms, together with some dormitory accommodation on the ground-floor, the upper floors being occupied as dormitories and single rooms, and with two staircases to each ward. The single rooms lead directly out of both day-rooms and dormitories in these wards. K indicates the position of the consulting-rooms, offices, and other administration apartments; L shows the dining and recreation-hall (provided with stage and other accessories), M indicates the kitchen-court, N the general stores, O the entrance and reception buildings, P Q R the chief attendant and dispenser's residences. S T the medical superintendent's residences, U the conservatory, V and Z bath-houses, W workshops and sheds, and Y the general washhouse and laundry. Nos. 1, 3, 6, 8, 30, 33, 25, 24 indicate water-closets, while Nos. 2, 4, 5, 7, 9, 29, 31, 32, 34, 35 show the airing-courts; No. 26 is the drying-yard (inclosing No. 21, the water-tower); the boilers and engines occupy a position at X.

Verandahs are erected on the ground-floor level on every side of all the patients' wards except wards C and J; but even these have verandahs on three sides, an arrangement more suitable in the Australian climate than in ours.

It will be observed from the foregoing examples that the Australians, in their Callan Park Hospital for the Insane, adhere to the system of inclosed airing-courts, while the American asylum (at Ogdensburgh), of which a plan was given in Fig. 50, exhibits nothing of the kind, the amount of freedom given to the American insane having determined the authorities to dispense with airing-courts that are fenced in, as being too prison-like in character, and this in view of the fact that the St. Lawrence River winds around three sides of this asylum, and within a few hundred feet (a temptation, it might be supposed, to those of the patients with suicidal proclivities). The Exeter Asylum plan is in strong contrast with the American and Australian plans shown in Figs. 50 and 51, as will be seen from the ground plan shown on Fig. 52. In this arrangement the patients' wards are mainly situated in one continuous line, over 800ft. in length. The whole of the administration and other buildings are situated to the rear of these, the recreation-hall occupying the central position in the front, while the main entrance is in the centre of the buildings at the back.

The dangerous patients, of whom there are 40 of each sex, are placed in the two wards marked No. 1 on the plan; the buildings marked E F H I being for day and single rooms on the ground floor. No. 2 wards are on the upper floors above each of the No. 1 wards. No. 3 wards are each for 40 working patients, and on the ground floor at D D there is on each side of the asylum a day-room, with one single room, and the usual offices. The two No. 4 wards are each for 70 suicidal, acute, and epileptic patients, and the reference to the plan, on each side, is: A M, dormitories; B C K L dayrooms; while the annexes for water-closets, &c., are shown at *a a*. The remaining references to Fig. 52 are: N, coals; O, post-mortem room; P, carpenters' and painters' shops; Q, tailors'; R, Turkish baths; S, visitors', bakers', and night attendants' rooms; T, dining-hall for males; Z, kitchen; Y, dining-hall for females; U and X, sculleries; V, male attendants' mess-rooms; W, female attendants' mess-room; G, is the recreation-hall; 1, main entrance; 2, bakery; 3, attendants' and visitors' rooms; 4, laundry-patients' day-room; 5, laundry; 6, dynamo house; 7, boiler-house; 8, post-mortem room and mortuary for females. The architect for this asylum is Mr. R. Stark Wilkinson, of Furnival's-inn, London, and by whose kindness I am permitted to give these particulars. This asylum was one of the first, if not the first, to be lighted by electricity; and, as appears on the plan in Fig. 52, a special building has been provided for its production. In the basement a corridor traverses the whole length of the building, in which a small tramway was planned for supplying the wards with coals and stores from the central blocks. The rain-water is collected and stored in underground tanks, and the drainage is kept separate and carried to sewage-irrigation tanks at the lower part of the farm lands.

Under various Acts of Parliament every county and, with certain exceptions, every quarter-sessions borough was compelled to provide, either independently or jointly with other counties and boroughs, lunatic asylums sufficient for the pauper lunatics of that county or borough. The county councils succeeded to the powers and duties of the quarter sessions of the county (and of the justices or town council of a quarter-sessions borough, the population of which, according to the census of 1881, was under 10,000, no such borough maintaining an asylum independently.)

The English law on the subject of the provision of lunatic asylums is very elaborate, and it may here be well to state that pauper lunatics are provided for in two distinct ways. In the first instance they are kept as "paupers," and maintained by the union or parish to which they, as paupers, have become chargeable; but where it cannot be ascertained to which union or parish they belong, they are chargeable to the county or to the borough in which they were discovered. In the second instance they are provided for as "lunatics," and asylums must be provided for them by the county or borough upon which they have a claim.

The cost of maintaining a pauper lunatic kept in a county or borough asylum must be divided between the union or parish and the county or borough in this way.

The parish or union must pay to the authority maintaining the asylum a sufficient sum to defray the expense of the lunatic's keep, clothing, and other matters, and, in addition, provide for the salaries of the asylum officials; but the Treasury make a grant towards the maintenance of each lunatic chargeable to the parishes.

The boroughs and counties are chargeable with the cost of providing and repairing the asylum and the necessary furniture; but where a lunatic is chargeable to a county or borough (owing to the impossibility of discovering to what union or parish he belongs), the Treasury also assist that county or borough.

The erection of a new asylum, or the maintenance of an existing asylum, is vested in a committee of visitors, who carry out all ordinary repairs of the asylum; but their total expenditure for the year in this respect must not exceed £400, and they must make an annual report (to the council of every county and borough interested in an asylum) as to the state and condition of that asylum, its sufficiency for the proper accommodation of the number of lunatics requiring care, the management and conduct of the officers and servants, and the results of the treatment of the patients and any other matters deserving of notice. A copy of this report must be sent to the Commissioners in Lunacy.

Architects may legally be authorised to prepare plans and estimates for everything necessary to be done in the erection of a new asylum or the

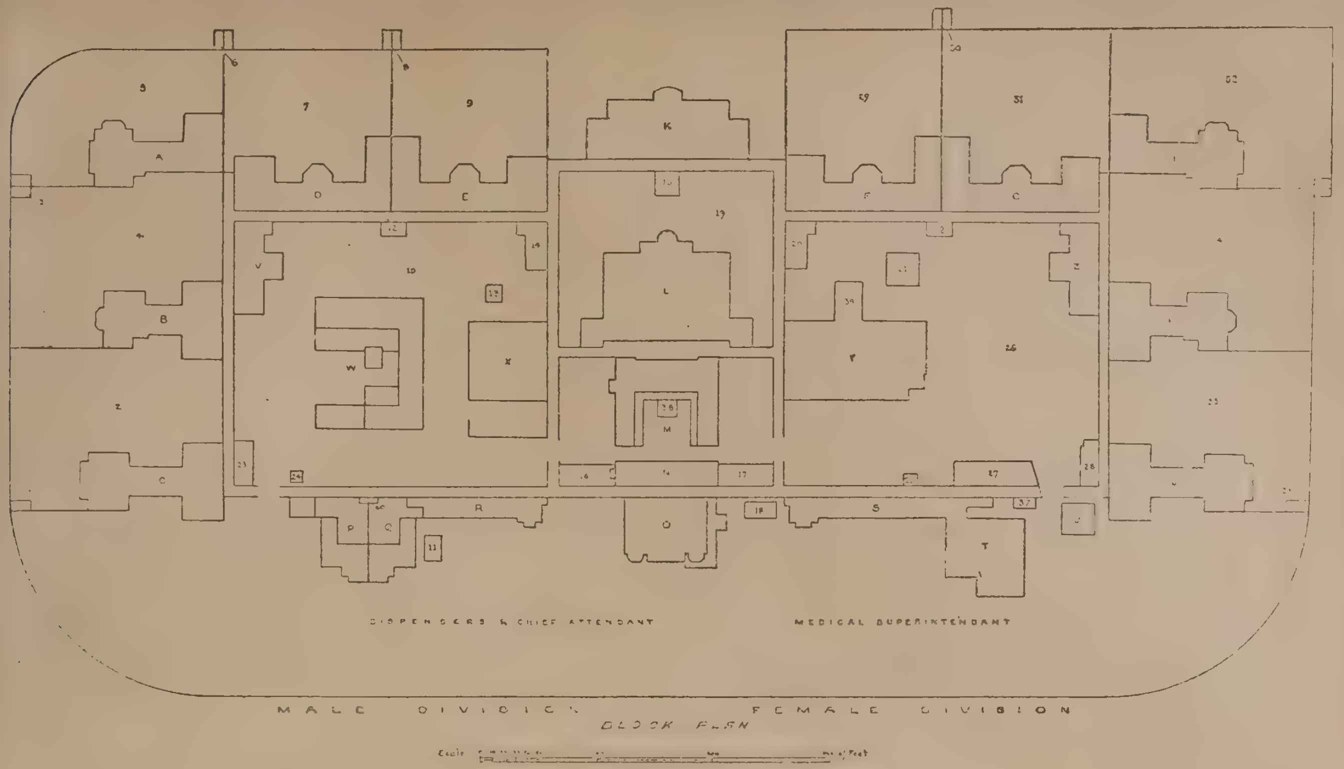


Fig. 51.

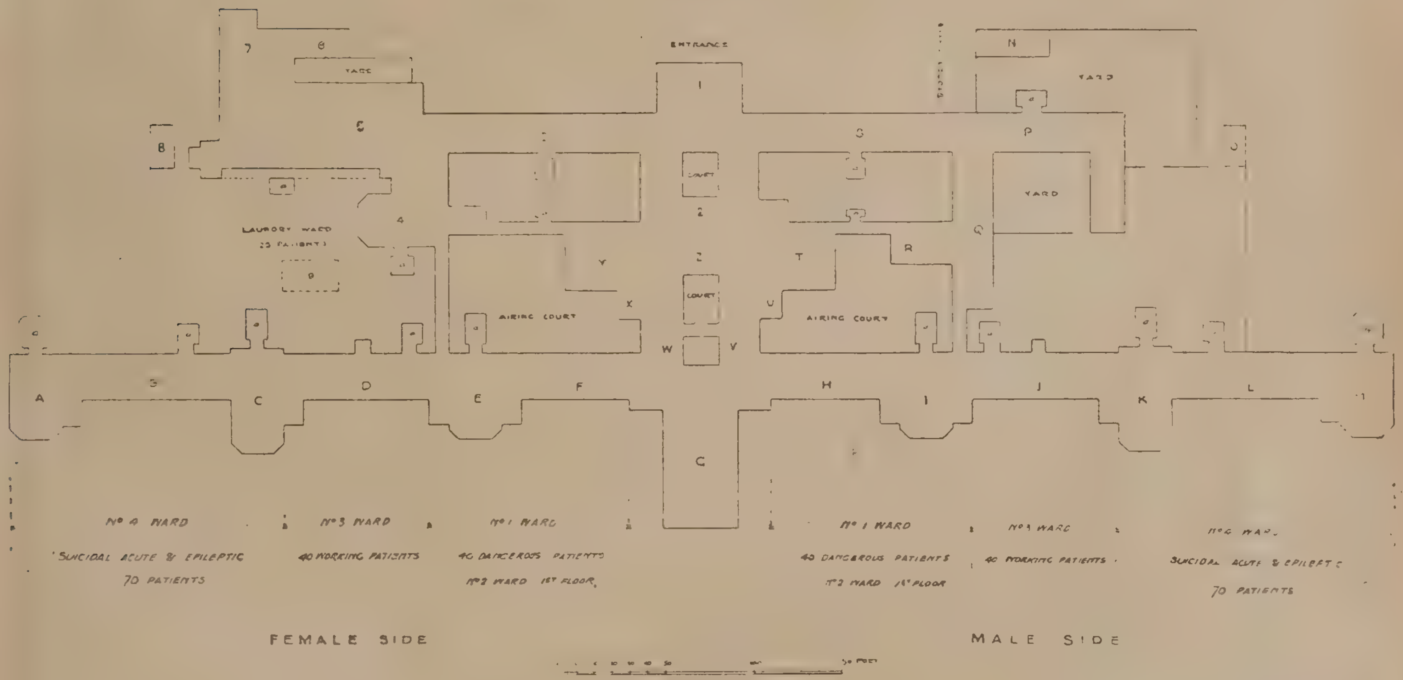

Fig. 52.

enlargement of an old one, if instructed by a committee of visitors who have been authorised by one or more public bodies interested to expend a certain sum; but if any of the authorities interested do not approve of the plans, estimates, or resulting contracts, while others approve, the objecting authorities must forward the plans, &c., with their objections in writing, to a Secretary of State, who must decide upon the question.

I have pointed out above that the sum of £400 only can be legally expended per annum upon the ordinary repairs of any asylum. This sum appears to be rather a small one for a large asylum, and in the case of five asylums, the accounts of which are before me, the sums so expended in one year are respectively £400, £400, £399 13s. 8d., £383 1s. 7d., and £397 5s. 11d., thus showing that the visiting committees must have considerable difficulty in adjusting their building accounts.

While in this country the asylum officials must report to the Commissioners in Lunacy, the officials and trustees of the American asylums must send in annual reports to the governors of the various States in the Union. These foreign reports are frequently of an elaborate description, and appear to be produced by men of high ability.

(*To be continued.*)

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—X.

By Joseph Horner.

BURNING-ON is a practice which everyone knows by name; but very few outside the trade know in what way it is done. It is a practice generally discountenanced, but one which is occasionally justifiable. Most inspectors would condemn work in which it had been done, and very properly, too. But there are exceptions in this as in other matters, and they are these:—

Burning-on is justifiable when done on some portion of a casting which is not a vital part; and also in some parts which are subject to moderate stresses only, it may be allowed to pass if there is ample margin of safety. Burning-on, again, is a job that some workmen can accomplish much more soundly than others, and when the work is known to have been done by a clever workman, that will be much in its favour.

Burning-on should on no account ever be permitted in parts subject to purely tensile stress. Cast iron is weak enough in tension when sound, and a burnt-on piece is seldom thoroughly sound and strong. It will be remembered that at the inquiry into the failure of the Tay Bridge, evidence was given to the effect that many imperfect lugs had been made good by burning-on. Being in tension, and forming as they did the attachment for the bracings, they were utterly unsafe. Only when lugs are subject to little stress, as when they form points of attachment for secondary details, would burning-on be justifiable. Burning-on may be permitted if the corner of a flange is broken off, or if a piece has been knocked ou of one side of a flange, or if there is a big blowhole in a part subject to compressive stress alone or if a moulding does not run up properly in some locality of limited area, &c. But there is always this risk incurred in any case—that of the casting becoming cracked during the act of burning-on, and, therefore, such cracks must be looked for keenly during inspection, and, indeed, rather expected. They are due to the difference in the temperature of the molten metal and that of the cold metal adjacent, which causes unequal expansive stresses, and often consequent fracture. As the art of burning-on successfully is little understood, I will illustrate it with two common examples, one that of a lug, the other that of a broken flange.

The art of burning-on consists in pouring molten metal over the fractured or imperfectly cast surface which it is desired to make good. It must be poured in sufficient quantity to cause fusion of that surface, and consequent union of it with the newly-poured metal. This is in effect soldering, and is sometimes termed "autogenous soldering." but the details of the process differ entirely from those employed in any soldering process, using the term in its commonly understood sense.

Obviously, in burning-on, it is not sufficient to pour some molten metal upon the surface which it is desired to make good. That would not raise the cold metal to the fusing point, and the hot metal would chill simply, and not adhere in the least degree. Neither is it practicable to raise the cold metal to the fusing point previously to pouring the hot metal over it. Hence the art consists in pouring a constant stream of hot metal over the broken part until the latter is thereby raised by mere contact and transmission of heat by conduction to the same state of fusion. Then, and not till then, the pouring can cease. But if the state of fusion is only partial, then union will only be partial, and therefore a careful moulder will try the fractured surface with the point of a rod from time to time, just as a smith does the surface of a joint to be welded, until assured that the whole surface is in the condition desired. In burning-on, it is much better to continue pouring a little longer than seems necessary rather than stop a little too soon. It is generally the case, therefore, that to burn-on a bit of metal weighing a few pounds, from four to six hundredweights will have to be poured on.

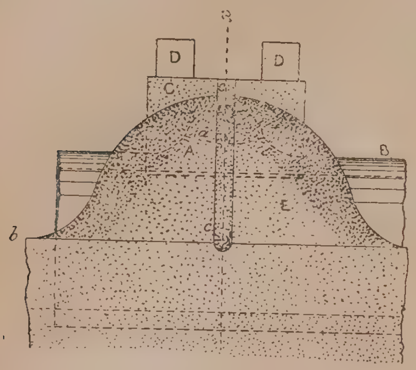

FIG. 39.

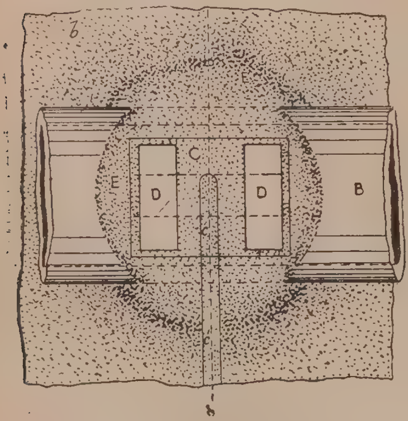

FIG. 40.

But, beside this, certain provisions have to be made for burning-on, provisions which seem rather elaborate in comparison with the small bit of work accomplished. The shape of the piece which has to be cast on has to be formed in a mould, not usually of common sand, but of loam cake filed to the shape required. This has to be set over the casting in position by weighting down, and further secured with a mass of surrounding sand, and a gutter or flow-off channel has to be cut to carry off the superfluous metal. Generally, too, the casting is first warmed to lessen the risk of fracture. If small, it is heated in a core stove, if large, it is warmed around the part where burning-on is to be done by means of lumps of red-hot iron—"heaters" These are the principles and precautions observed in burning-on, of which the accompanying figures illustrate examples.

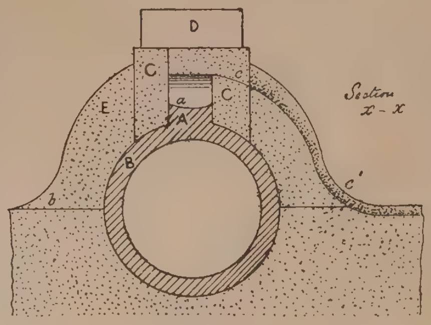

FIG. 41.

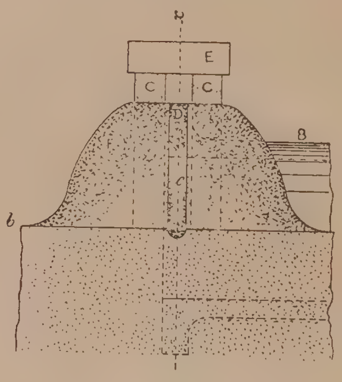

FIG. 42.

Figs. 39-41 illustrate an arrangement rigged up for burning-on a portion of a lug, A, on a column, B, which has either been fractured, or imperfectly moulded, along the break *a*. Fig. 39 is an elevation, or side, view of the mould, Fig. 40 a plan, and Fig. 41 a section of the same along the plane *x-x*. The column B is bedded in the sand floor of the foundry to any convenient depth. In these figures *b* is the floor-line. A piece of dried loam cake C is then filed out to fit over the column and broken lug, and also filed to the required supplementary outline of the lug. The hollow, curved outline thus filed is seen dotted in Fig. 39, and indicated by the shading in Fig. 41. By comparing the three figures it is seen how the loam cake is made to embrace the broken lug, and form a mould for the supplementary outline which has to be cast. A gutter or flow-off, channel is cut in it at *c*, commencing from the level of the top of the lug, in order to carry away the metal, as explained just now. The piece of prepared cake is then set finally in position, and loaded down with weights, D, D, and a quantity of sand, E, is beaten and pressed around it, so that it shall not shift, nor the metal run away anywhere except by the channel c^1 provided for it in the sloping wall of sand, reaching from the channel *c* cut for it in the loam, down to the floor line. There is no runner, or ingate, through a solid top of loam cake, but the cake is left quite open, as shown in section in Fig. 41. The flow-off channel commences therefore at the highest part of the casting. The moulder can thus both see what is going on, and feel the surface, *a*, below with the point of a rod, until he finds it has been brought into a molten condition by the pouring of the new metal. The metal is poured very hot, and very slowly, directly on to the broken face, so as to cause fusion to take place with the least possible expenditure of metal and time. Four or five hundredweights would probably have to be run through before a lug four or five inches long, by a couple of inches thick would be burnt on properly.

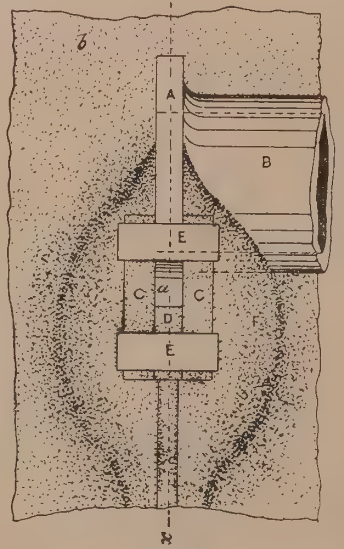

FIG. 43.

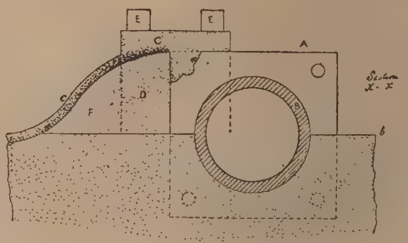

FIG. 44

Figs. 42-44 illustrate the rig-up for burning on the corner of the flange of a column. The elevation is shown at Fig. 42, the plan at Fig. 43, and a section on the plane *x-x*, at Fig. 44. The flange A, on the column B, has been fractured at *a*. The column B is bedded in the sand of the floor *b*, and three flat pieces of loam cake C C D, D being of the same thickness as the flange, are fitted against the flange. C C are carried up above the top edge of the flange, and the only egress for the metal is over the top of D, which is made level with the top of the flange A, and conducts down to the flow-off channel *c*. Weights E E are laid on top, and a body of sand, F, is rammed round to confine the pieces of cake, and prevent leakage of metal at the side, and the gutter *c* is cut to carry away the metal.

In Fig. 44 I have shown the fracture as having taken place through a bolt-hole, as would almost invariably be the case. It is better not to try and core another hole, which can be done by the insertion of a core, but to leave it to be drilled afterwards. It is not so easy to drill afterwards, because burnt-on metal is rather hard. But if the attempt is made to core it, the chances are that the union will not be so perfect.

These illustrations will be sufficient to show how fractured parts are made good by burning-on. Rigs-up would necessarily be modified in different jobs. But the general principles and practice are clearly indicated here. A burnt-on part can generally be recognised, provided the casting has not been doctored subsequently. It is rough in the vicinity, and looks as if burnt. A part burnt-on should be tested with two or three smart blows of a hand hammer before being passed.

◆

The foundation-stone of the new offices of the Free Church Temperance Society, which are to be erected in Bank-street, Edinburgh, was laid, on Friday, by Lord Overtoun.

The urban district council of Eastleigh, Hants, have appointed Mr. Batten, surveyor to the late urban district council of Shirley and Freemantle (now incorporated with Southampton) as their surveyor, at a salary of £150 per annum. There were 78 candidates for the appointment.

"A DUKE OF BURGUNDY."—PLANS FOR DAIRIES.—DUNCOMBE PARK, YORKS.—NATIONAL SILVER MEDAL DESIGN FOR AN OAK SIDEBOARD.—MONUMENT TO MR. JOHN GIBSON.

Our Illustrations.

"OLD MASTERS" ON THE CONTINENT: XXVII. "PORTRAIT OF A DUKE OF BURGUNDY."

This Flemish painting, from the Royal Gallery at Brussels, is by an unknown hand, and it represents an unknown personage, so that the interest attaching to the work is entirely confined to the picture, quite apart from any other consideration. The costume and the architectural accessories of the scene enhance its value and decorative effect, which is largely due to the skilful way and minute care with which the detail is painted. The hands of the duke are clumsy in scale, resulting, to some extent, from the thick gloves which he is wearing. In the middle picture the nobleman seems to be represented prostrating himself before the Queen of Heaven, with his coronet, sceptre, and cup displayed on the ground, while his ladies point to the descending angel bearing sealed assurances of acceptance of the ducal prayer. In the distance the landscape adds much to the charm of the painting.

PRIZE PLANS FOR DAIRIES.—(THE BRITISH DAIRY FARMERS' ASSOCIATION.)

These designs for dairies, adapted for the manufacture of both butter and cheese, and capable of dealing with the milk of 25 and 50 cows respectively, were exhibited at the recent Dairy Show, at the Agricultural Hall, Islington. The 25-cow dairy was placed second in order of merit, obtaining the third prize, there being two prizes only awarded in this class (81) by the judges. The 50-cow dairy was commended in class 82. In both designs the architects, Mr. A. R. G. Fenning, F.R I.B.A., of 46, Lincoln's Inn-fields, and Mr. H. S. Fenning, F.S.I., of 8, St. Paul's-square, Bedford, have recognised that the "setting" of milk in the old-fashioned way in "pans" or "leads" is now virtually obsolete, owing to the almost universal use of the "cream separator," which effects so large a saving of labour, and greatly increases the yield of cream. They have therefore given no separate "milk-setting room," ample space being provided in the dairy for the temporary setting of milk in pans on slate shelves in case of a breakdown of the separator. The drawings given herewith furnish a complete set of plans, with details of a practical character for both buildings usefully shown to scale.

DUNCOMBE PARK, YORKS.

Duncombe Park, Lord Feversham's Yorkshire house, stands on a terrace at a considerable height above the town of Helmsley. The original mansion, said to have been designed by Vanbrugh, was burned down some years ago. The new house has been rebuilt from the foundations, and accords with Vanbrugh's plan generally. Mr. William Young is the architect. The entrance front follows the outline of the original house; but the other fronts have been varied, and the elevations all round are much less severe than those of Vanbrugh's design. The walls are faced with Farndale stone—a hard, warm-coloured freestone quarried on the estate—and the floors throughout are fireproof. The principal features of the interior are: an entrance-hall about 40ft. square and 40ft. high to the top of the domed ceiling, and a saloon 84ft. in length, the walls being panelled in oak from floor to ceiling. The walls of the halls are entirely of stone, with Corinthian columns, and in the dome there is a figure of Jupiter, relieved by the azure-blue ground of the dome. The wings were built by Sir Charles Barry; that on the north side was destroyed by fire last year, and has been reconstructed. Messrs. W. and J. Kirkwood, of Edinburgh, were the general contractors for all trades; and the decoration was done by Messrs. G. Jackson and Sons, of Rathbone-place, London. Our illustration is from the architect's drawing in this year's Royal Academy exhibition.

NATIONAL SILVER MEDAL DESIGN FOR OAK SIDEBOARD.

In the design for dining-room sideboard a departure is attempted from the usual arrangement of sideboard and back, and while fulfilling all the purposes for which this piece of furniture is required, the designer has contrived to build the back and underpart in one piece, thereby obtaining greater unity of design. The style adopted is a free rendering of the Renaissance, with a somewhat new character introduced into the carved ornamentation. The wood intended is darkly fumigated oak, with the drawer furniture, lock-plates, and lamps of Florentine bronzed copper. A high oak wainscoting is intended to work with the sideboard, the capping moulding of which would correspond and intersect with the sideboard cornice, in order that the sideboard may form a portion of the room. and gain dignity from its fixity. The author of this design, of which we give a view and two sheets of details, is Mr. H. Davis Richter, of Bath, to whom a national silver medal was awarded this year at South Kensington.

MONUMENT TO THE LATE JOHN GIBSON, ARCHITECT.

The monument of so distinguished an architectural practitioner as the late Mr. John Gibson, F.R.I.B.A. and Royal Gold Medallist of the Institute, cannot fail to be of interest to our readers, quite apart from its merit as an example of sepulchral design. We, therefore, have arranged on one of our plates to-day two plans and a general view photographed from the actual building, and besides these we give two enlarged details. The grave of our eminent deceased *confrère* is in Kensal-green Cemetery. The architect of the monument was Mr. Harold Brakspear, A.R.I.B.A., of Corsham, Wilts; and the contractor Mr. C. H. Mabey, of Vauxhall Bridge-road. The materials are Portland and red Dumfries stones, with a polished red Peterhead granite plinth. The cost of the substructure put in by the cemetery authorities came to £65, and the superstructure to £455.

◆

Mr. W. H. D. Robotham, C.E., of Wolverhampton, engineer of the central division of the Great Western Railway Company, has been appointed as engineer of the whole of the northern lines of the Great Western system from the 1st January next. Mr. Robotham will then have charge of the whole of the system between Oxford and Birkenhead, with headquarters at Wolverhampton.

Sir Frederic Leighton having, at the request of the Siddons Memorial Sub-Committee, viewed the various models submitted in the competition for the commission to execute a statue of Mrs. Siddons, to be erected on the site on Paddington-green granted by the local vestry, a meeting of the general committee and subscribers will be held at the vestry-hall, Harrow-road, at 11 a.m., to consider his report. Mr. T. H. Baylis, Q.C., will preside.

The sisters at the Home of the Community of the Epiphany at Truro have received several additions to their chapel. A new reredos in carved oak, of Late Gothic character, has been erected. In the central panel, under a canopy of traceried work, is a full-length figure of Our Lord, standing with outstretched arms in the midst of glory, having the outline of a Vesica. A new shrine has also been added. It is of carved oak, the cross itself being of ebony, and the figure of the crucified Christ hung upon it of pear-tree. These additions are the handiwork of Messrs. Harry Hems and Sons, of Exeter.

COMPETITIONS.

Belfast.—The proposed competition for the Protestant cathedral for Belfast has been abandoned, and Messrs. T. Drew, of Dublin, and W. H. Lynn, of Belfast, have been definitely appointed architects. There is little probability that they will be overburdened by their new duties, for the proposal is to expend at least £100,000 on the more spacious building which will replace the present parish church, towards which sum only £4,000 has been offered. Actual building operations are not to be commenced until the committee have £20,000 in hand. However remote the prospect of realisation may thus appear, Messrs. Drew and Lynn are already at work, we understand, preparing their design for the approval of the committee.

Kentish Town.—The promoter of the sketch competition for artisans' dwellings at Kentish Town has selected the following out of the 46 designs submitted, as being, in his opinion, the best:—(1) Harry Heathman, Barnard House, Clarence-road, Redcliff, Bristol; (2) C. Pickford, 14, Great James-street, Bedford-row, W.C.; (3) A. P. Killick and H. S. Wood, 16, Basinghall-street, E.C.; (4) W. G. Lewton, 44, Queen's-crescent, Reading; (5) Valentine L. Knight, 21, Donberg-road, Blackheath. None of these designs, however, altogether meet the wishes of the promoter, and it is therefore not intended to carry any of them out. The unsuccessful designs have been returned to their authors.

Shoreditch.—The premiated designs for the public baths and library are as follows: Mr. Henry T. Hare, first; Mr. A. H. Tiltman, second; Messrs. Groll and Todd, third. The drawings will be on view to the public from Thursday next, Dec. 5, for a fortnight, in the council chamber of the Town Hall, Old-street, E.C.

CHIPS.

A new Primitive Methodist chapel, at the corner of Stratford-road and Wilton-road, Sparkhill, Birmingham, was opened on Wednesday week. The chapel seats 620 persons, and there are in addition vestries for choir and minister, and a lecture-hall at the rear, which will hold 200 persons. Schools, for which sufficient land has been retained, will soon be commenced. The work, which has been carried out by Messrs. J. Harley and Son, Smethwick, from the designs of Mr. A. Harrison, Birmingham, will cost about £3,700.

On account of the increasing summer traffic at Rothesay Harbour, the trust have decided to extend the pier westward, at a cost of £7,860. The extension will be 250ft. long by 50ft. wide. The pier, which is at present the largest on the Clyde, will then have a straight unbroken frontage of 570ft.

Mr. J. W. Bird Clerke, a Local Government Board inspector, held an inquiry at Eccles on Friday, into the application of the town council to borrow £3,250 for an extension of the town hall and the provision of municipal offices.

A meeting of the operative plumbers of Dalkeith and district was held on Saturday night, at which deputation from the United Operative Plumbers' Association of Scotland was received. Messrs. John Addison, the secretary, and J. W. Wilson, Edinburgh, addressed the meeting on the importance of organisation, and it was unanimously agreed to form a branch of the association for the district.

Robert Laws, the foreman to a large firm of building contractors, was charged on Monday before the Aldershot magistrates with being concerned with Sergeant-Major Greener, of the Royal Engineers, in stealing in July a large quantity of zinc, the property of the Queen. The accused, it is alleged, consigned to a firm in London zinc ingots, which had been melted down and sent away by Greener. The zinc was supplied for generating gas in connection with the Military School of Ballooning, and was sent to the railway station in Government waggons, in charge of the Royal Engineer sappers. The prisoner was remanded, bail being allowed.

The report of the Nicaragua Canal Commission will be found very disappointing to those who expected to see the project speedily executed. The cost is roughly estimated at 133,472,893 dollars, against the promoters' estimate of 69,893,660 dollars. Moreover, it is said that to proceed upon the present plans would be impracticable, because of the inadequate knowledge regarding the hazards. The commission advises that fresh surveys should be made, and these, it is estimated, will require an expenditure of 350,000 dollars, and a period of eighteen months to carry out.

Engineering Notes.

Kew Bridge.—The County Council of Surrey at their last meeting received a report from their highway committee stating that the time had now arrived when Kew Bridge should be rebuilt; that it should be built of stone; that the rebuilding, irrespective of approaches, from abutment to abutment, should be borne equally by each county; and that the approaches on each side should be at the cost of the respective counties; that Mr. J. Wolfe Barry, C.B., be asked to submit designs and approximate estimate. A member called attention to Mr. Wolfe Barry's previous report, in which he stated that the cost of a stone bridge would be about £90,000, and of a steel bridge £65,000. He moved an amendment that the designs and approximate estimates to be obtained from Mr. Wolfe Barry should be for a bridge of stone, or steel, or iron, with a report which of the structures he would recommend for adoption, and that the committee should report to the council again. The amendment, after a long discussion, was carried by 29 votes to 26.

Building Intelligence.

Burnley.—The opening of the new infirmary adjoining the workhouse at Rake Head, Burnley, took place on Nov. 21. The building is constructed on the pavilion principle, and consists of two wings, each two stories high, with an administrative block in the centre. It is built of Yorkshire pierpoints, with local stone ashlar dressings. The whole of the floors are fireproof. The total accommodation is for 185 beds. There are four wards, each holding 34 beds, and four isolation wards for pulmonary cases, as well as eight more isolation wards for other cases, together with lying-in wards. There are also bedrooms for the official staff. The heating is on the hot-water low-pressure system, by steam passing through calorifiers, and there are also open-fire ranges in each room. In each of the large wards there are two of Shorland's double-fronted stoves. There are baths, lavatories, and w.c.'s on every floor, in both the sick ward and the administrative block, with hot and cold water; fire appliances on the landings on each floor, and iron escape stairs to both pavilions and the central block. The drainage is fitted up with disconnecting traps and automatic-flushing chambers. The cost of the building will be £30,000, exclusive of furnishing and land The contracts have been executed by the following:—Masons' and bricklayers' work, Messrs. A. and R. Parker; joiners' work, Messrs. R. Dean and Sons; concrete work, the Phœnix Fireproof Company, Manchester; slaters' work, Mr. W. Stanworth, Burnley; hot water, Messrs. James Blezard and Sons, Padiham; plumbing and gas-fitting, Mr. John Brooks, Burnley; mantelpieces, Messrs. Doulton and Co., London; ventilators, Messrs. R. Boyle and Son, Ltd., London.

Glasgow.—The new portion of Glasgow Post Office, which has been under construction for several years, was opened on Monday. It has been erected in Ingram-street, to the south of, and as a supplement to, the main structure in George-square. The building is a block of three floors, with a space of 120ft. by 77ft. on each floor. On the ground floor sorting accommodation is provided, and there is a letter-carriers' sorting department on the first floor. On the top floor is the telegraphic-instrument department. Formerly there were in use at this office between 4,000 and 5,000 primary cells, but these are now replaced by 250 secondary cells. This is the first application in Scotland of Faure's accumulating system of secondary batteries, the old primary battery being thus superseded. The plant for supplying the energy and lighting the building has been erected in the basement of the new block. There are three 80I.H.P. engines of the Willans' central-valve type. The dynamos are mounted on the engine frame, and are of Crompton's make. An important extension of the system of transmitting telegrams by pneumatic tube was also brought into use on Monday, pipes having now been laid to Fishmarket and St. Enoch-square. The total length of tube working into George-square is now 4,362 yards.

Knot Mill, Manchester.—Considerable progress has been made with the new Knot Mill station-buildings at Deansgate, Manchester. The design is Gothic in style, and the material used for the main front is red brick, with carved stone facings. The building will be surmounted by a clock tower. From the entrance, which is faced internally with dark brown brick and a gold and brown dado, there is a slight incline, leading by a flight of steps 15ft. wide into the booking-hall. The platforms will be considerably widened, and raised so as to be almost level with the steps of the carriages. On the Bowdon side there will be a general waiting-room, as also cloak-rooms and other conveniences. On the Deansgate side are the station master's offices, ticket collectors' rooms, and waiting-rooms. The platforms will be covered, the roofing being of steel-work. The widening of the Deansgate Bridge is already in a forward state. The street running parallel with the Rochdale Canal is to be widened 75ft. The new buildings, which are down for completion about September, 1896, are from drawings provided by the joint engineers of the London and North-Western and Manchester, Sheffield, and Lincolnshire Railway Companies (Messrs. Francis Stevenson and Alexander Ross), and the contractors are Messrs. R. Neill and Sons, of Manchester.

CHIPS.

Mr. J. Q. Orchardson, R A., has been elected a member of the Academy of Fine Arts in Paris.

A monument to the memory of the Fenian Manchester martyrs has been executed by Sir Thomas Farrell, R.H.A., for erection in Glasnevin Cemetery, Dublin. The memorial, which stands 17ft. in height, has cost £600.

The parish church at Symington, N.B., was reopened on Friday, after having been closed for alterations. The building has been reconstructed, and considerably enlarged, by addition of an apse at the east end, widening the north transept, and a new entrance and entrance porch at the west end. A small vestry, with heating cellar below, has also been built. The lintelled windows have been converted into Gothic lancets, and the interior is now open to the roof, and the exterior has been rough-casted, with a shade of colour to match the Tinto rock. The church is heated by hot-water pipes above the floor, and ventilated. The cost of the improvements, for which Messrs. Hardy and Wight, of Edinburgh, were the architects, has been about £600.

The Shoreditch Library Commissioners have accepted an offer by Mr. Passmore Edwards to enlarge the Haggerston Public Library at an estimated cost of £2,000. The cost of the building and the grounds was defrayed by Mr. Edwards three years ago.

A drinking-fountain has been erected at Conway to perpetuate the memory of Llewelyn the Great. The base of the fountain is worked in Anglesey limestone, surmounted by a column of Cross-hill stone, fluted and festooned. On the top of this column a bronze Corinthian capital upholds a bronze figure of the great Welshman, who is represented in the full chain armour of the first half of the 13th century. The work was designed by Messrs. Grayson and Ould, Liverpool, the figure being modelled by Mr. E. O. Griffith, of Liverpool.

A new Wesleyan schoolroom at Lofthouse was opened last week. The new building has cost nearly £1,300, and provides accommodation for 450 children. The principal room is 57ft. by 32ft., with half a dozen class-rooms, besides a church-room 27ft. by 15ft. The architect is Mr. Arnold Nicholson, of Wakefield.

The London Master Plumbers have established a Metropolitan branch of the National Association of Master Plumbers. Mr. Charles Hudson, Mr. D T. Bostell, and Mr. Marshall are the chief officers.

In the case of Cecil Herbert Morgan, Samuel Eveland Isted, and Edward Percy Morgan (carrying on business as Morgan, Isted, and Morgan), Southampton, contractors, the discharges from bankruptcy have been suspended for three years ending Oct. 15, 1898.

A Local Government Board inquiry has been held at the Barnstaple Guildhall by Colonel Hasted, R.E., on a proposal by the Barnstaple Town Council to borrow the sum of £4,550 for improvements. The works consist of sewerage, sewer ventilation, street repairs, the provision of a steam roller and steam crusher, and the erection of a bandstand in the Rock Park. The south end of High-street, from the top of Cross-street, will be repaved with wood if the loan is sanctioned. There was no opposition to the proposal.

The course of business in the Estate Market at Tokenhouse-yard last week was good for the period of the year. The aggregate for the week was £83,849, of which no less than £73,599 was compiled on Thursday and Friday.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

London and Middlesex Archæological Society.—The first meeting of the session of this society was held at the Old Mercers' School, College-hill, on Tuesday week. The Rev. Meyrick J. Sutton, M.A., Master of the Mercers' Company, presided. The members adjourned to the church of St. Michael Paternoster Royal, where a paper explaining the architectural and historical features of the building was read by Mr. J. Douglass Mathews. From the church they returned to the schoolroom, when Mr. Charles Welch, F.S.A., read a paper on "Old Pewter Vessels." Some specimens which had recently been discovered at Buckington were exhibited by Alderman E. Rayden. A paper on the history of the Mercers' School was also read.

Sheffield Society of Architects and Surveyors.—The members of this society visited the new Sheffield Royal Hospital on Saturday afternoon, on the invitation of the president, Mr. Charles Hadfield, F.R.I.B.A., who is the architect for the building. Among those present were Messrs. C. J. Innocent (hon. secretary), E. M. Gibbs, T. Winder, T. H. Waterhouse, J.P., Wm. Parkin, J. T. Cook, James Hall, J. B. Mitchell-Withers, J. Norton, W. F. Hemsoll, J. R. Wigfull, W. J. Hale, C. Gibson, E. Winder, jun., J. D. Townsend, J. E. Benton, W. T. Brown, and about 40 other members. The contractors for the building—Mr. Molloy, earthwork; Mr. Webster, masonry; Mr. Tomlinson, joinery; Mr. Rodgers, painting; Mr. Higgins, plastering; and Mr. Sutliffe (Messrs. Haden and Co.), warming—were also present; and Mr. Buchanan, the clerk of works, assisted the architect in explaining the plans and the building. Under Mr. Hadfield's guidance the party made a tour of inspection over the buildings, and were very much interested in the general and technical arrangements. In proposing a vote of thanks to Mr. Hadfield, Mr. Wm. Parkin said that as a lay member of the society he had been much interested in all that he had seen, and especially was he pleased at the friendly feeling which the architectural profession in Sheffield exhibited. He did not suppose that in any of the local trades anyone would invite others in the same business to come and see his work. The motion was seconded by Mr. T. H. Waterhouse, J.P., supported by Mr. T. Winder and Mr. C. J. Innocent, and carried unanimously; and on the motion of Mr. E. M. Gibbs, seconded by Mr. E. Winder, jun., a vote of thanks was passed to the board of management of the hospital for throwing it open to the society.

* * *

Notice is published of an application to be made to Parliament for power to reconstruct the dock at Sutton Bridge, on the river Nene, South Lincolnshire, which was constructed 14 years ago at a cost of £170,000, and collapsed just as it was about to be opened, owing to a subsidence of the soil. It is believed that the dock can be restored for an expenditure of something like £40,000, and the money to be expended is paactically guaranteed.

The Hull Corporation are applying to the Board of Trade for a provisional order to enable them practically to relay or construct some eleven double lines of tramways in the borough. The corporation are desirous of obtaining authority to lease the undertaking either in part or in whole, and to confirm an existing agreement with the Hull Street Tramways Company for the purchase of their lines. The corporation also wish to reserve the right of using whatever power they think fit for propelling purposes.

Col. C. H. Luard, R.E., inspector for the Local Government Board, held an inquiry at Felixstowe Town Hall on Tuesday week into an application for sanction for a loan of £1,900, for the purchase and laying out of land as public pleasure grounds, and the provision of shelters, lavatories, &c., and seats by the Felixstowe and Walton Urban District Council. Mr. G. S. Horton, surveyor, explained the scheme.

Reopening services were held on Sunday in St. Luke's Church, Newcastle-on-Tyne, after the completion of extensive alterations. The chancel-floor has been raised, and the steps and tiling within the altar-rails laid with marble. An oak screen, the gift of an anonymous friend, has been erected, and the rough blocks in the chancel have been carved into figures of angels. A memorial window, the work of Mr. Baguley, has been put in. The decoration of the chancel and cleaning of the church has been done by Mr. Carr, of Northumberland-street, and the electric-lighting is by Messrs. Rowland Barnett and Co.

NOTES FROM PARIS.

THE village of Herblay, a short distance outside Paris, is energetically continuing its legal struggle with the Parisian municipality. This lawsuit, which has been going on for some time, arose from the fact that in 1891 the town of Paris forcibly concluded the expropriation of a large surface of land, the property of the commune of Herblay, for the purpose of constructing thereon the collector and works necessary to receive a portion of the drainage matter coming from Paris. The inhabitants of the village and neighbourhood protested very strongly at the time against the utilisation of their land for such a purpose; but at length submitted on the condition that a considerable indemnity be paid them by the town of Paris. This indemnity, amounting to about £5,000, has never been paid, and the inhabitants of Herblay are now very indignant at the insult of being poisoned gratuitously and without indemnity, added to the injury of having their lands spoiled. The court of Versailles has just decided the case in favour of Herblay; but the contending parties are once again sent back before the jury of expropriation. The village council expects to now secure an indemnity of several millions of francs. The jury will, however, meet in a few days, and we shall learn the result of the fight between a small and daring village and its capital city.

The Paris municipality is, however, not yet near the end of its troubles occasioned by the drainage question and the new system of *tout à l'egout*. The little town of Bougival, on the banks of the Seine a small distance below Paris, has the intention of bringing up the question of the responsibility of its capital in the courts of law, its claims being the injury and prejudice caused to the town by the disagreeable and unhealthy odours rising from the river Seine, into which a considerable portion of the drainage of Paris is sent, causing the desertion of the many visitors accustomed to pass their summer at Bougival, and a consequent diminution of the business of the inhabitants. Several environing communes have the intention of following the example of the larger town. The cause of the prejudice coming, however, from the Seine itself, the lawsuit would first have to be brought against the State, the proprietor of the river; the State, however, if the case went against it, would in its turn attack the town of Paris. This being so, it is probable that the matter will last for two or three years, when it is hoped that the important drainage work now being actively undertaken by MM. Bechmann and Launay, chief engineers of the town of Paris, will be completed, and as then no drainage will be suffered to enter the river, the law case will be abandoned, for its reason will no longer exist.

The question of supplying Paris with water from the Lake Leman, on the Swiss frontier, a scheme explained in recent notes, appears to be likely to receive serious attention. A credit of funds sufficient for the expenses of the preliminary study of the means of supplying the city with about 250 million gallons of water per day has been voted, and proper investigations regarding the purity and fitness of the water of Lake Leman for drinking purposes will at once be made.

The chief object of the interesting artistic presents recently made to the town of Paris by the Czar of Russia is a magnificent vase, roughly valued at £10,000, and now installed in the Salle des Cariatides of the Hotel de Ville. This vase, about 10ft. high, and weighing about 8 tons, was entirely manufactured at the Imperial stone-cutting works at Peterhof. The upper portion, in the form of an amphora, is entirely of green jasper, the support being of red jasper; the pedestal, of Siberian stone, forms an octagon. On each side of the vase, two small bronze figures represent the French Republic, with Phrygian bonnet, and Russia, with the diadem head covering. The inscription, "Cronstadt - Toulon," 1891-93," separates the French and Russian escutcheons. The sculptured portion is the work of the Russian artist Tchijoff; the *ensemble* of the vase is treated in a soberly, elegant style, being at the same time very effective.

The first premium of £280 in the competition for the reconstruction of the Cour des Comptes has been carried off by M. Moyaux, General Inspector of Civic Buildings, the second of £200 by M. Blavette, and the third of £120 by M. Maridud. The assessor, M. Guadet, Government architect, explaining the reasons of the jury in its choice of the plans and designs submitted by M. Moyaux, said that this scheme appeared the one which held the closest to the programme demanded, the design being as simple as possible, and completely respecting the line of the original monument on Quai d'Orsay. The original façades are maintained, and no modification is proposed, the idea of the premiated architect being simply to restore a monument of undoubted artistic value. It is now hoped that the new building will be completed in time for the Exposition of 1900.

At a recent meeting of the higher committee of the 1900 Exposition, the question was entered into regarding the programme of the competition which is to take place for the construction of the two important palaces to be erected in the Champs Elysées. Much discussion arose as to whether these two buildings should form the object of a single competition, or whether it would be better to arrange a separate competition for each of the buildings. M. Bouvard, chief director of the Exposition, proposed that the most practical manner of settling the question was to invite architects to take their chance of sending in designs for either of the two palaces separately, or for both united in one scheme. In the former case, however, they should include a plan showing their ideas for the position of the building they do not compete for. It seems, however, doubtful if this system of competition will prove satisfactory, and will not give rise to unexpected annoyances and discussions during the selection of the designs. The resignation of the late Ministry has somewhat delayed the necessary ratification of the Exposition scheme, but it is hoped that the matter will very shortly be brought before Parliament and the whole scheme passed, when the programme will at once be issued and three months allowed for the preparation of the plans and designs.

The financial portion of the Exposition is advancing in a very successful manner, for very nearly the double of the proposed funds has already been found. Forty-six financial schemes were submitted to the committee; none of these, however, have been adopted, but several of the ideas presented were borrowed from them as being worthy of study. The funds proposed as necessary for the proper preparation and working of the whole scheme amounted to four millions sterling. Of this amount nearly two and a half millions were to be found and provided by private enterprise; the remaining one and a half millions to be provided half by the State and half by the town of Paris. The system to be followed will be similar to that which proved very successful in 1889, the issue of bonds including in their value a certain number of entrance tickets. Five of the principal banking houses promise to negotiate this issue, and offer a certain guarantee in return for a commission of £200,000 allowed to them for their services and the expenses necessary for the issuing of the bonds to the public. The two and a half millions to be provided by the organising body of the Exposition have, therefore, been divided into 3,250 parts of about £800 each, and offered not only to the above banking houses, but also to the various chambers of commerce, private bankers, and merchants. The idea has been most successful, for it has just been announced that subscribers for nearly 6,000 parts have been found, nearly doubling the first proposed issue of 3,250 parts. The funds necessary for the Exposition are therefore more than assured; the ratification by Parliament is the only thing now wanted. The owners of the bonds will enjoy special advantages, not only the chances which they will have in the numerous lotteries, but they will also profit by the rebate of 25 per cent. on the rents and moneys paid for grants of land and right to erect theatres, concert-hall, &c., in the Exposition grounds, as well as important reductions of the railway tariffs for the carriage of materials or exhibits to the Champ de Mars. The whole scheme of the 1900 Exposition appears, therefore, to be on a fair road; the great drawback to its thorough success, however, is the metropolitan railway, which, it was hoped, would be completed as regards a large portion in time for 1900. This matter is not at all an easy one to decide; the hesitation of the various railway companies, the indecision with regard to which scheme should be adopted, and the heated but lengthy controversy on the subject, make it more than possible that the end of this century will see Paris as denuded of its much wanted metropolitan railway as it is to-day.

M. Charles Garnier, the distinguished architect of the Paris Opera House, who was some time ago strongly opposed to the scheme of the Exposition of 1900 and the proposed modifications to the existing buildings and grounds of the Champs Elysées, has now completely changed his opinion, and writes in to-day's *Figaro* a very interesting but somewhat satirical article, giving his reasons for his change of ideas, and urging the directors of the Exposition scheme to do their utmost to push forward the whole undertaking. The conversion of such a well-known architect will probably bring others in their turn to look with more favouring eyes on the work of the proposed international fête.

The interesting historical Château d'Amboise, belonging to the late Comte de Paris, has been bought by the Duc d'Aumale, who proposes to devote this old dwelling of Royalty into a "maison de retraite" for the veterans of the African army.

The monument erected to the memory of the late well-known writer and dramatist Emile Augier, was unveiled on the 16th inst. by the Minister of Public Instruction. Placed on the square in front of the Odeon Theatre, it consists of a porphyry column surmounted by a bronze bust of the late author. A young girl personifying Comedy draws the attention of a second figure representing the "Aventurière," the heroine of the *chef d'œuvre* of Augier, to the name of the dramatist engraven on the column. On the other side of the column is the figure of a child, holding the whip of satire in one hand and in the other a mask. The little monument is simple in style, but leaves an exceedingly good impression. A touching speech was made by M. Jerome, who also read the speech which had been prepared by the late musician Gounod, who originated the subscription for this monument, and who had hoped to speak the praises of his best and oldest friend at its unveiling, if death had not been premature in claiming him before the opportunity had come.

The directors of the Louvre shops are again opening a competition to all comers for the following subjects: a woven and painted panel of wall-hanging, and a decorative scheme for the electric-lighting of a dining-room. Three prizes of £60, £40, and £20 will be awarded, and several gold and silver medals.

The directors of the daily paper the *Figaro*, who lately organised and decided a competition for the construction of new premises and salle de depâches in the Rue Drouot, evidently intend to provide for themselves a strikingly original building for they have just invited all manufacturers who may feel interested to submit ideas for the decoration, heating, lighting, furnishing, &c., of the proposed new building, with all the latest improvements and materials which the development of modern building industries and decoration might suggest. It is certain that at this moment —in Paris especially—there is a great call for all that is original and decorative for the exterior and interior installation of public establishments, the result being a very effective, but sometimes gaudy, medley of all kinds of decorative and constructional materials produced by the inventive genius of the present age. The transformation of the cafés into brasseries, now quite à la mode, which is taking place in the principal streets of Paris, is an example of this, where the use of enamelled and decorated glass, ceramic ware, stucco, and all kinds of objects in various metals for capitals, electric-light brackets, cornices, &c., including large surfaces of walls and ceilings in glass and enamel mosaic work, is rapidly influencing the architecture of this sort of building, and producing a number of heterogeneous, but sometimes not unpleasing styles, which will certainly later on influence the construction and style of other class of buildings.

The service of Beaux-Arts has at length decided to go on with the work of completing the fine Daru staircase, at the Louvre. The work consists in replacing the old steps by new ones of fine marble, with the addition of an artistic wrought-iron balustrading, and the completion of the interesting mosaic work of the second dome. The new architect of the Louvre Palace is M. Paul Blondel, an old "Grand Prix de Rome."

The report of the committee appointed to inquire into the causes which led to the bursting of the Bouzey reservoir dam, which, it will be remembered, caused so much disaster and loss of life on April 27 last, has been for some little time before the Parliamentary Commission; but has since a few days only been made public. According to this report the real cause of the giving way of the dam was the extra head of water, amounting to about 7ft., which had been allowed to enter the reservoir, and which had not been foreseen in the original calculations made when constructing the dam. This surplus head of water, combined with the numerous fissures which had been neglected or badly repaired, and possibly other hidden fissures caused by variations in the temperature, were sufficient to have allowed the sudden dislocation of the dam at any given moment. It is probable that the fissures themselves might in any case have caused the giving way of a small portion of the embankment; the additional head of water, combined with these, was enough to produce the dislocation of the dam along a large portion of its length. The question of responsibilities seems rather to have been left a matter for further discussion, the committee of inquiry appearing not willing to take upon itself the duty of condemning its comrades of the Ponts and Chaussées.

The Savoyarde, the new great bell of the church of the Sacré Cœur, was baptised with great ceremony yesterday, and given the name of Françoise Marguerite du Sacré Cœur. The bell was clothed with a drapery of magnificent lacework, worth about £3,000, the gift of the Countess de Boigne, the godmother elect. At the close of the ceremony the bell was rung, the sound being, however, very disappointing, and not at all answering to the high praises which had been made of its power of sound and tone. At the present moment the bell is suspended at a height of 20ft. only, on temporary scaffolding; when placed at its destined elevation of a little over 100ft. in the bell-tower, which is at present being constructed to receive it, the opportunity of proving its real strength of sound and tone will be given.

It has been decided not to repair the damage done to the façade of the Montparnasse terminus station by the fortunately rare accident which occurred a few weeks ago, when a runaway passenger train flung itself through the front of the building into the street below. The State has decided to buy the railway line from Paris to Versailles on the left bank of the Seine, and will make the Montparnasse station the terminal point of the line from Bordeaux to Paris. The existing station will be demolished, and replaced by an immense monumental terminus station, with important staircases and carriage inclines leading to the upper level.

ARTHUR VYE PARMINTER.

Paris, Nov. 21.

SANITARY SPECIALITIES.

WE have received a new illustrated catalogue of sanitary specialities manufactured by the well-known firm of Messrs. J. Duckett and Son, Ltd., of Burnley, Lancashire. This firm's excellent automatic slop-water closet is a speciality which has already received deserved attention from sanitary experts and the profession. We have already in these pages drawn our readers' notice to the valuable points of Duckett's patent automatic slop-water closet, having seen it in operation. We can speak of its simplicity of construction, its powerful flush, and its noncorrodible parts. Arrangement A illustrated on p. 8 shows this apparatus applied to an ordinary house-drain, taking the closet and yard and sink discharges. The pivoted tipper, to flush three gallons, placed under the dishstone of yard, flushes the house-drain as well as closets. The yard-gully is dispensed with as a source of nuisance. The apparatus is made of salt-glazed earthenware. The tipper, hinged on brass axles, with rubber buffer, tilts its contents of slop-water when full, which flushes the drain and closet-trap. Another arrangement, B, shows the apparatus applied to the drain when the closets are a long way from the slop-stone sink. In this case the slop water is collected near the closet, the tipper forming a part of the pan, and discharges with great force into the annular basin and trap. The inlet pipes from yard trap to tipper, the siphon trap under closet, and outlet are all shown in plan and section, so that the mode of fixing the apparatus is clearly seen, and directions and levels for fixing are given. Duckett's automatic tippers for flushing are made of all sizes, even for sewers, from 3 to 100 gallons; sections of these are given, with dimensions of chambers, inlets, and outlets. Arrangement "C" shows the same principle applied to multiple closets, by which a succession of pedestal closets can be flushed from a tipper at one end receiving the slop-stone water. The patent "latrines or trough-closet" arrangement is well adapted for schools, factories, &c., where the closets are in long rows. These are flushed from Duckett's patent flushing tank, in which a tipper works. All these arrangements are clearly illustrated by plans and sections drawn to a large scale. Illustrations of the firm's automatic w.c. for mills and workshops, patent pedestals, self-cleansing channel gully which prevents splashing, street gullies, &c., are shown. Wherever slop water can be collected this system of flushing closets and drains has many advantages over clean-water flushing.

◆

BOOKS RECEIVED.

The Engineering Magazine, October (London: George Tucker, Salisbury-court, E.C.), contains an interesting and illustrated article on the "Canadian Lumber Industry," by T. S. Robertson, full of statistical and useful information. Canada's reputation rests mainly on its white pine of the province of Ontario. The vast pine resources of the Ottawa valley can clearly be gathered from the fact that the cut of white pine and Norway pine lumber in this province amounts to about 700,000,000ft. a year. Several excellent photo. blocks illustrate this district—such as a log jam on the Nashwaak River, drawing and piling logs, lumber ready for shipment, loading lumber, shipping, lumber yards, Ottawa, &c. We read, "The question has been raised lately whether dressed lumber, which is exempt from duty, includes flooring and other lumber that is matched and grooved. The Board of Appraisers of the United States has ruled against this rendering, and if sustained it will be a barrier to the establishment of planing-mills in Canada"; but it is thought that free lumber has come to stay. Besides the tall pines of Ontario, the British Columbia red cedar trees are much admired. And the article by G. Phené Spiers on "Architectural Students' Work Abroad" gives some interesting facts regarding the different methods of work pursued by those two great leaders of Gothic—William Burges and Geo. Edmund Street.——*The Law of Building and Engineering Contracts*, by ALFRED A. HUDSON, of the Inner Temple, Barrister-at-Law. Second Edition, in two vols. (London: Waterlow and Sons, Ltd., and Stevens and Haynes).—This edition is a very comprehensive exposition of the law of building, engineering, and ship-building contracts, and of the duties and liabilities of engineers, architects, and others. It is much enlarged. The architect and engineer will find in these two portly volumes an epitome of the law of building contracts, with a list of cases and precedents. The authority of architects and engineers, their powers as general agents in various points, rights of builder, &c., are fully discussed in the second chapter; their duties and liabilities, charges, bills of quantities, tenders, contracts with public bodies, certificates, extras, &c., are treated with considerable fulness. The illustrations, printed in small type after the exposition of law in every case, are very useful, and the table of cases and references are most useful and complete. The classification adopted is perhaps a trifle too elaborate and bewildering. As a textbook of the law of contracts we can safely recommend this work, which we have tested in some points.——*Practical Masonry*, by WILLIAM R. PURCHASE, with lithographic plates (London: Crosby Lockwood and Son), is a practical guide to the art of stone-cutting, intended for students of masonry in the workshop and building. The author, who has been an operative mason, and is building inspector to the town of Hove, treats his subject in a concise and practical manner, each branch being illustrated by lithographic diagrams to a readable scale. After a section on tools and appliances, we have practical expositions of arches and joints, forming plane and winding surfaces, dressing stones, working cornices and shafts, staircases, arches circular on plan, skewbacks, cylindrical vaults, domes, groined vaulting, tracery, and mouldings. The method of developing winding stairs, the quoin and wall ends and working of the winder is explained and illustrated by examples. Several plates illustrate the mode of setting out domes and pendentives, and the section on groined vaulting, a rather puzzling branch of masonry, will be found to explain the various steps of making the mould and working the vault of a quarter of the space intended to be vaulted, the other portions being repeats of the process. The setting out and working of all useful building problems in masonry are clearly described. There are no unnecessary verbiage or geometrical disquisitions which render the ordinary treatises so obscure to beginners, who know little of projection, only so much of it being presumed as is necessary to the cases treated.

◆

OBITUARY.

THE death is announced of Mr. WILLIAM WATHERSTON, builder, late of the firm of Messrs. John Watherston and Sons, Edinburgh. He was a man of great business capacity, and was very successful in speculative building, one of his most conspicuous undertakings being the erection of a network of streets on the Drumsheugh estate at the west end of the city. The deceased took a keen interest in his workmen, and some years ago he gave, as a benefaction to the Merchant Company, a sum of £40,000 for the payment of £12 each to masons unfit for work, and at the present time there are upwards of a hundred recipients on this fund. Mr. Watherston, who died on Friday last at his residence in Rothesay-place, Edinburgh, retired from business four years ago.

◆

CHIPS.

A new church is being built on Lundy Island from designs by Mr. Charles Pinn, senior, of Exeter. It is Decorated Gothic in style, is being built of local granite, with Doulting stone dressings, and will have a tower 70ft. high.

While workmen were engaged in building a four-storied tenement in Garngad-road, Glasgow, on Monday, a steam boiler and crane erected on a high scaffold collapsed owing to the snapping of the jib of the crane, and fell into the street. Hugh M'Cready, who was in charge of the crane, and James Thompson, a lad, were killed, while Hugh Taylor, the foreman of the works, and Hugh Docherty, a workman, received serious injuries.

An exhibition of Spanish art will be held at the New Gallery from next December to April, 1896. The collection will illustrate the arts of Spain from early Mediæval times, including Moorish art of the Peninsula to the present day. The examples will include the following arts:—Painting, sculpture, books, goldsmiths' work, metal-work, pottery, textiles and embroidery, and furniture.

New corporation baths are about to be built in Monson-road, Tunbridge Wells. The façade will be of red bricks with terracotta dressings, and is three stories in height. The swimming-pool will measure 90ft. by 35ft., is to be paved with white glazed tiles, and will be surrounded with three tiers of galleries carried round three sides. There are also suites of private baths, twelve in all. Mr. T. W. Mellor, the borough engineer, has prepared the plans, and the estimated outlay is £7,200.

An organ was opened on Saturday at St. Cross Church, Bangor, an edifice recently built at the cost of Lord Penrhyn.

On Wednesday week Colonel Luard, C.E., Local Government Board inspector, attended at the town hall, Ipswich, to hold an inquiry relative to the borrowing of £6,500 for the purchase of a further portion of Christchurch Park and the erection of shelters and conveniences. Mr. E. Buckham, borough surveyor, explained the plans.

At the annual meeting of the Glasgow Philosophical Society Mr. T. L. Watson was re-elected president of the architectural section.

The parish church of Groombridge was reopened last week after restoration. The works have included the substitution of a tiled roof for one of slates, the interior being divided into panels by oak purlins, and the restoration of the masonry. Mr. Warren was the architect, and the contractors were Messrs. Sumner and Sands, of Groombridge.

At the City Guildhall yesterday (Thursday) afternoon the freedom and livery of the Turners' Company were presented to Mr. J. Wolfe Barry, C.B., in recognition of his work as engineer of the Tower Bridge.

A tilting helmet, of iron studded with copper, has been discovered during some repairs at Tudeley Church. It probably hung over the fine tomb of George Fane, of Badsell, who died in 1571. It will be placed at the disposal of Lord Falmouth, the present representative of the Fanes.

On Saturday Earl Beauchamp laid the foundation-stone of a new church in Frank-street, Highgate, near Birmingham, dedicated to St. Patrick. It is proposed at present to erect a building providing accommodation for about 690 worshippers, at a cost of £3,200, and eventually to add a chancel and two vestries, which will provide accommodation for a total of 720 worshippers. Part of the present temporary church will be converted into a girls' school. The contract for the building has been intrusted to Messrs. Barnsley and Son, of Birmingham, and the architect is Mr. J. L. Pearson, R.A.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—F. Yardley.—Quarryman.—C. M. and Co.—J. E. Wilmott.—F. R.—C. W. J.

FREE GRATIS FOR NOTHING!

To the Editor of the Building News.

To Architects and Builders.—Woking, Surrey.—The committee of the Woking, Horsell, and District Conservative Club Company, Limited, desire to receive Plans for the erection of Club premises on land in Commercial-road, Woking (near the site for the new Municipal Buildings), having 60ft. frontage, and a depth of about 180ft. Plans will be inspected by the *committee only*, and returned. An estimate of the probable cost of such building should accompany the Plans. No Plan or Estimate will necessarily be accepted. The cost of the building is to be about £1,500. No Entertainment Hall with Stage required. Send Plans and Estimates to R. Brettell, Solicitor, Chertsey.

Sir,—The above advertisement is from the *Surrey Advertiser* of Saturday last. Pity it did not appear in the Building News, so that it would give some of your young architectural readers an opportunity of competing, as there are already in Woking, and within a radius of six miles, 36 architects, exclusive of builders, who are prepared to furnish plans and estimates, some free of charge, providing they get the job.—I am, &c.,

Guildford, Nov. 23. A.

TECHNICAL TERMS.

Sir,—May I add an "item" or two to Mr. Gavin Burns's corrections (in a recent Building News) of "English as she is wrote" by the profession?

Sailing, used of a course of bricks, is not derived from any supposed resemblance to the course of a ship moved by wind, but is jerry-builder for *salient*, springing, jutting, or projecting. Some people, having wit enough to see that *sailing* is nonsense, without being aware of its origin, try to improve it by making it *oversailing*; but this leaves us still at sea in the matter. As the correct word is "not understanded of the vulgar," it would be much better to say *projecting*—a word which every one knows.

Baulk, used of large timber, I take to be *bulk* mispronounced, and then spelt accordingly.

Furring has no connection with the coat of any animal; but merely serves to show the inexpressiveness of its original—*firring*, which is intended to mean blocking up with fir, and is apparently used on the *lucus a non lucendo* principle, for the work is usually done with pine, a distinct wood. (Fir is the white wood, the yellow wood is pine, and no trade ignorance or custom can justify confusion of them, any more than of oak with ash, or of beef with red herring.) *Filleting* or *blocking* is the best term to use.

Purlin is an apparent perversion of *perline*—through-line.

Wreathed—used of curved rails and the like—is not due to any supposed resemblance of the bent wood to a garland; but, doubtless, stands for *writhed*—twisted.

Lintol for *lintel*, *soffite* for *soffit*, *rabbit* for *rebate*, *molding* for *moulding*, and even *corked* for *caulked*—are not infrequent errors.—I am, &c.,

Enfield, Nov. 25. W. Simmons.

CHIPS.

New Y.M.C.A. buildings are in course of erection at Kingswood, near Bristol. Mr. Rogers is the contractor.

On Saturday the East and West Molesey sewerage works were formally opened. The scheme has cost £36,000.

The scheme for a light railway from Bideford Quay, through Kennorth to Westward Ho! and thence to Appledore, has taken definite shape. The capital will be from £15,000 to £20,000. Mr. Jervis, M.I.C.E., is the engineer, and Parliamentary powers are being sought.

The Chief Secretary for Ireland has sanctioned the completion of a jubilee road, which is intended to connect Mulcranny with Belmullet in the south-western district of Connemara. The northern section was made a part of the relief works carried out this year, and it is now intended to complete the southern section, which will form a good level road and shorten the distance between the two places by seven miles.

The Lancashire Standing Joint Committee for the County Constabulary have appointed Mr. H. Littler, of Manchester, son of Mr. Henry Littler, architect of many county buildings, as permanent architect for buildings required for the force. The salary is £600 per annum, but there is no pension or retiring allowance. Originally there were 90 applicants.

The school board for Farnham have just completed a new board school at Badshot Lea. It contains places for 150 boys and girls and 118 infants, and has cost £4,060. Mr. H. Paxton Watson was the architect, and Messrs. Kemp and Son were the builders. The new buildings are of red brick and rough cast; the desks and interior woodwork are stained and varnished. The principal apartment is for a mixed school, attached to which are two classrooms. The infants' section contains two rooms. The master's residence is detached.

In Dublin, the Southern Tramways Company have nearly completed an installation of eight miles of double track from Haddington-road, Dublin, through Blackrock and Kingstown to Dalkey. Electrical traction will be employed upon the system.

The Leeds Sanitary Committee were informed on Friday that the Local Government Board had given sanction for the corporation to borrow £63,000 for the purpose of erecting new fever hospitals upon the Manston estate. The accommodation for patients in the existing fever hospitals in that city is inadequate even to meet present requirements, and patients have been unable to obtain admission.

An organ, built by Mr. J. J. Binns, of Bramley, Leeds, has been opened this week at St. Andrew's parish church, Newcastle-on-Tyne.

The annual prize distribution in connection with the Westminster Technical Institute took place on Friday evening at Westminster Town Hall. Mr. Burdett-Coutts, M.P., presided, and stated that the students had gained, in public competition, two silver medals and one bronze medal, six money prizes (amounting to £22), a Queen's prize, 38 first-class and 116 second and third-class certificates, or a total of 164 distinctions, as compared with 133 for the preceding session.

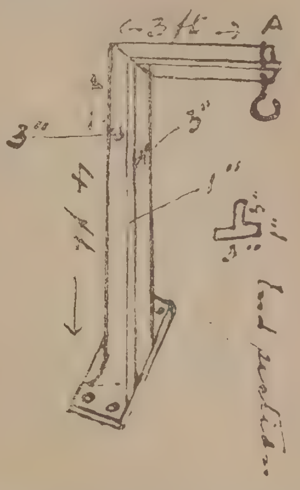
A new building for the secondary department of Niddrie-road School, Portobello, Edinburgh, was formally opened on Friday. The new portion forms one large room, but by means of sliding partitions it can be divided into two rooms. Mr. Robert Wilson, of Edinburgh, was the architect.

Intercommunication.

QUESTIONS.

[11457.]—**Slate Hanging.**—There is a building here (Torquay) which is slate-hung externally, and the slates are hung with fragments of clay-pipe stems. Have any of your readers ever heard of this method of hanging slates before? I might add that the building would come under the head of "antient."—C. Sewell Appleton.

[11458.]—**Malleable Iron.**—Would a malleable casting as sketch bear half-ton on hook A, to be drawn up by pulley blocks, or had I better have wrought-iron, and what difference in the price?—H. J. W.



REPLIES.

[11452.]—**Colour on Parchment.**—It will be found by experience that parchment varies; some skins will take colour very well. Try dusting the skin with finely-powdered alum, wipe with a soft cloth, and use ox-gall (sold in pots) with the colour.—H. L.

[11453.]—**Prices, &c.**—(1) The price of brickwork varies in London from £12 to £16 per rod, according to the quality of bricks used. Details would occupy more space than our Editor will allow. (2) In London and the home counties brickwork is always given in rods, reduced to 1½ brick in thickness; but when sending bills of quantities to the provinces brickwork is given in yards super. of one brick thick. (3) Timber is always given in feet cube, except very small, rough fillets, which are in feet run, and the size stated. (4) Builders naturally object to any departure from established customs, and local methods should be considered.—H. L.

[11454.]—**Skittle Alley.**—I cannot put my hand on notes; hope to answer fully and practically next week.—H. L.

[11456.]—**Extras.**—"J. W. C." can charge 5 per cent. on contract, and extras also 2½ per cent. on omissions; but the latter charge is not made unless the omissions are of considerable amount.—H. L.

St. Robert's Roman Catholic church, Morpeth, built in 1849-50 from plans by the late Mr. T. Gibson, of Newcastle, was reopened on Wednesday week, after it had been for three months in the hands of Messrs. Atkinson Brothers, artists in stained glass and church decorators, New Bridge-street, Newcastle, who have designed and executed very elaborate decorative work in its interior.

A syndicate has been formed to carry out, subject to the approval of Parliament in the ensuing session, various improvements in the James-street area of the parish of St. Mary Abbott's, Kensington. The scheme is to be subject to agreements between the "undertakers" and the vestry, and will provide for the widening of Charles-street and the western end of St. Alban's-road, and the construction of new streets between Kensington-square and St. Alban's-road, and between Kensington-square and Kensington-court. The "undertakers" are to be authorised to hold and build upon, sell, or let any lands, buildings, or property acquired by them under the Act.

St. Peter's Church, Derby, the most ancient church in the town, is about to be repaired and enlarged. Mr. W. H. Lloyd, of Birmingham, architect to the church committee, called attention to the rapid deterioration of the fabric on all sides, and since then experts have advised the removal of the tower because of its dangerous condition. It has, therefore, been determined to demolish the tower and to erect one in a different position. The church is also to be extended. The total cost is estimated at £5,000.

An ordinance has been passed in San Francisco, limiting the height of buildings to 130ft., where they front on streets 100ft. or more in width, and to 100ft. where they front on streets less than 100ft. wide, and requiring that all structures over 80ft. in height shall be of fireproof materials throughout.

Legal.

BREACHES OF COVENANT.

THE question whether a lessor has acquiesced in a breach of covenant in the lease so as to bar his remedy by forfeiture is one that frequently depends upon the facts that can be brought forward in support of that theory. Such acquiescences must, indeed, always be a matter of fact to a great extent; but, all the same, there are certain principles of law applicable, by which in practice we should be guided. In the recent case of "Ashcombe v. Mitchell" (*Times*, Oct. 31) the whole matter was discussed by the Court of Appeal. There the original lease had been granted in 1843 for 99 years. This contained a covenant by the lessee that no goods or other articles should be hung out or exposed for sale or other purposes in front of the shop windows or outside the premises. Such a covenant is frequently inserted for the very purpose of keeping up the quality of shop property, and preventing it from falling in value as far as is possible. It appeared that in 1844 the original lessee granted an underlease to the defendants in this action for 80 years with the same covenant. He in his turn, in 1864, sub-leased the premises to a Mr. Lloyd for 21 years, and omitted to insert this clause. In 1867 this sub-lease was assigned to the other defendant, Field, together with the drapers' business he bought. Now, the plaintiff brought his action against the under-lessee and his sub-lessee, claiming a forfeiture on the ground of a breach of the above covenant, and so to recover possession of the premises.

The defence was that from 1867 down to 1884 this covenant had been broken, and goods had been hung outside the shop. It was said that this had been done with the knowledge, and therefore with the acquiescence, of the plaintiff or his agents; and thus that the law would pronounce from that fact a release of the covenant in question. Mr. Justice Charles, who tried the case, held that as the only evidence before him was that the surveyor of the estate and the receiver of the rents knew of the goods being so exposed for sale, he could not hold that this was in law the knowledge of the lessor, and so he gave judgment for the forfeiture. The Court of Appeal has now confirmed this ruling, on the ground that there was no evidence of acquiescence by the plaintiff, or by any person whose knowledge would be binding upon the plaintiff, and that the covenant had, in fact, been broken for 17 years was not conclusive, and as the defendants had no license to break this covenant, the lessor was entitled to his judgment.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

CONTRACT.—BREACH.—DAMAGES.—WORK.—You have a claim for something. It would be as well to sue for damages for breach of contract, or, in the alternative, for the value of the work you have done.

Q.E.D.—CONTRACTORS.—LOSS OF TIME.—They would probably be held liable if the facts could be proved; but all would depend upon the evidence. You should claim against owner and contractor as liable in the alternative.

PROCRASTINATION. — DEBT. — LIMITATIONS. — The six years would begin to run from date when rent was due—i.e., from final certificate. But new committee could not as individuals be made liable for debts of predecessors. Accept payment of later account without prejudice to earlier claim.

ONE IN DOUBT.—PAVING. — APPORTIONMENT. — There should be a reasonable adjustment, and the question could be raised by an appeal. The Athletic Company are chargeable as adjoining owners. It is a case for a local solicitor.

PUZZLED.—AGREEMENT.—SERVICE.—NOTICE.— Even if the letter is to be taken as an agreement, it seems clear that in his failing to give the security for his fidelity you could terminate at once. Therefore, I consider the week's notice is quite enough.

◆

The font of Canterbury Cathedral has, after a lapse of 108 years, been replaced in its original position in the nave of the cathedral. Presented by Bishop Warner, of Rochester, in 1636, it was, later in the century, pulled down and scattered by the Puritans. Its fragments were, however, recovered by Mr. Somner, who returned them to the Dean and Chapter, and at the restoration of Charles II. it was re-erected in the nave. In 1787 it was removed to what is now known as the baptistery of the cathedral, a space which is henceforward to be devoted to the use of the lay clerks as a vestry.

LEGAL INTELLIGENCE.

ARCHITECT AND CLIENT.—WM. BURROUGH HILL v. JOSEPH KAPHAM.—At the Southampton County-court on Nov. 19, a claim for £20 was heard, made by W. B. Hill, an architect and surveyor, of Southampton, for plans and specifications prepared for the defendant in connection with certain premises in St. Mary-street. There was a further claim of £2 2s. for tracing plans and forwarding the same for application to the urban sanitary authority. The case was heard by his Honour, Judge Leonard, on the 12th February last, but the Judge then held that the action of the plaintiff was premature, and gave judgment to defendant, without prejudice to other action. The plans had been prepared by Mr. Hill at the request of the defendant, who subsequently altered his mind, and now declined to pay for work done. The plans and specifications had involved an enormous amount of work, for which Mr. Hill had received no remuneration. Plaintiff, cross-examined, said that the plans were at first refused by the corporation, but he was willing to alter them to comply with the borough regulations. He never before had a client who refused to meet him. He could not alter the plans without defendant's consent. His Honour said that plaintiff had not carried out the original contract, and he must be non-suited without prejudice.

LONDON BUILDING ACT AND BEERHOUSES.—John Auley, a builder, of Dalston-lane, was summoned to Lambeth Police-court, on Tuesday, by Mr. Ellis Marsland, M.S.A., district surveyor, for failing to comply with a notice served upon him under the terms of the new Building Act of last year.—The defendant has been building the Boyton Arms Beer house, Boyton-road, Camberwell, and was alleged to have committed an irregularity in not making the passages, staircase, and means of approach to that portion of the premises used as a dwelling-house of fire-resisting materials. It appeared that the staircase had been made of wood. For the defence it was said that the public portion of the premises was separated from that set apart for domestic purposes by a fire-resisting wall, fitted with a fireproof door, and it was contended that as the staircase was contained within the dwelling-house, the Act did not require that it should be constructed of fireproof materials. Mr. Hopkins dismissed the summons, subject to the defendant undertaking to put a fireproof door at the bottom of the cellar steps.

◆

CHIPS.

Mr. R. G. Watt, of 77A, Victoria-street, Belfast, has taken into partnership Mr. F. H. Tulloch, who has been assisting him, and they will in future practise together as architects and engineers under the name of Graeme-Watt and Tulloch.

Mr. Onslow Ford, R.A., has been commissioned to execute the statue to be executed at Birmingham as a memorial of the late Rev. Dr. R. W. Dale.

The City and Waterloo Railway, which was commencdd eighteen months ago in the bed of the river south-west of Blackfriars Bridge, has reached as far as Wardrobe-chambers, Queen Victoria-street. It is anticipated that a junction will be effected with the proposed site of the Bank Station, in connection with the Central London Railway, by June next. The engineers are Messrs. W. R. Galbraith and J. H. Greathead, Mr. H. H. Dalrymple Hay being the resident engineer. Messrs. John Mowlem and Co. are the contractors, and are represented on the works by Mr. William Rowell.

The arbitrator (Mr. Robert Vigers, F.S.I.) appointed by the Home Secretary to hear matters in dispute regarding the Lincolnshire County Pauper Lunatic Asylum, at Bracebridge, near Lincoln, between the Kesteven County Council and the Grantham Town Council on the one hand, and the Lindsey and Holland County Councils, the Lincoln Town Council, and the Grimsby Town Council on the other hand, sat at Westminster on Friday.

Two additional free libraries are about to be built in Camberwell, to serve the requirements of the Nunhead and Dulwich districts respectively.

In a fresh appeal issued for subscriptions towards the completion of the Aberdeen University Buildings extension scheme, it is stated that the total subscriptions now amount to £103,462. The expenditure for sites, and the liabilities for buildings and fittings amount to £110,741, thus showing an excess of liabilities over subscriptions of £7,279. The revised statement of the probable cost of the remaining portion of the scheme is £33,000. A further sum of £40,000 is thus still needed for the works. Of this it is hoped Government may contribute £20,000, leaving £20,000, towards which Dr. Mitchell will contribute £6,000, reducing the sum still to be raised to £14,000.

The Wick Harbour Trustees have received a communication from the secretary of the Public Works Loan Board stating that a loan of £13,000 will be granted for further harbour improvement works.

WATER SUPPLY AND SANITARY MATTERS.

ARBROATH WATER SUPPLY. — The Arbroath Burgh Commissioners resolved on Friday to extend the underground water supply of the town by sinking a new well in the lands of Warslap, and connecting it by means of an adit passing through the water-bearing gravel bed, with the wells and pumping station at Nolt Loan. The adit connecting the wells will be about a quarter of a mile long. It was decided to engage the services of Mr. A. M'Culloch, of Messrs. A. and R. M'Culloch, C.E., Edinburgh, and M'Culloch and Jamieson, C.E.'s, Dundee, in advising the board in the carrying out of the work.

BIRMINGHAM WATER SUPPLY.—A meeting of the Birmingham City Council was held on Tuesday, in order to formally authorise the Water Committee to proceed with the promotion of a Bill in Parliament to confer upon them further powers in relation to the execution of the Welsh water scheme. The cost of the extension is estimated at £110,000. The principal matter with which the Bill deals is the provision of land for the deposit of soil, and the construction of a railway from Rubery to Frankley for the conveyance of materials required in the construction of the Frankley reservoir. The resolution giving the committee the necessary authority was carried without dissent.

BOLTON.—An adjourned inquiry into the application of the Bolton Corporation for powers to borrow £75,000 for the purposes of sewage treatment on land near Clifton Junction, was held at the Bolton Town Hall, on Friday, before Mr. R. Walton, C.E., an inspector of the Local Government Board. The Irwell Bank Spinning Company, Messrs. Champion and Co., of Farnworth, and Messrs. Fletcher, of Kersley Paper Mills, objected to the scheme proposed by the corporation on the ground that it would seriously interfere with their supply of water from the river, which in dry weather was now at times so limited as to stop their works for hours together. It was alleged that the corporation were entering upon a scheme which might land them in enormous claims for compensation from various individuals. The corporation, it was said, were prepared to accept the full responsibility with regard to possible claims for compensation. A number of witnesses were called in opposition to the scheme, and the inspector also inquired into an application of the corporation for permission to borrow £5,000 for technical school extensions and improvements.

DOUGLAS, ISLE OF MAN.—A committee of the Manx Legislature, which met at Douglas on Tuesday, practically agreed, as the result of several years' deliberation, and with the unanimous consent of the town commissioners, to a scheme of drainage of the whole town of Douglas, to cost £30,000. The scheme is that of Mr. Stevenson, civil engineer, Westminster.

STRATFORD-ON-AVON.—The successful completion of a work of sinking a new artesian well was commemorated at Stratford-on-Avon on Monday. For many years Messrs. Flower and Son, of the breweries there, had been dependent upon the local water supply for all requirements; but the water was excessively hard, and in dry seasons uncertain in quantity. This induced the firm, about a year ago, to call in experts to advise them as to the possibility of obtaining water from an independent artesian supply. Messrs. H. T. Brown and A. Timmins took the matter in hand, and, acting upon their advice, a 12in. well was made, and lined with special wrought-iron artesian-well tubes, $10\frac{1}{4}$in. bore, manufactured by Messrs. Lloyd, of Birmingham. These tubes were fixed to 311ft. The well was then continued, 10in. bore, to 636ft., the marl having been penetrated at 604ft., and the sandstone reached, and it early showed signs of being charged with water, as after boring 20ft. in it the water rose from 263ft., and began to run over to the surface to waste. The well was then cased with 9in. tubes, and continued 8in. diameter in the sandstone to the full depth of 804ft., when the overflow was 4,000 gallons per hour. The water rose into a high-level cistern at 56ft. above the ground surface. But as this quantity was insufficient, it was decided to put a pump-pendant in the borehole. The pump was $7\frac{1}{2}$in. bore, and fixed 150ft. below the surface. Worked by an 8N.H.P. high-pressure expansion engine, the water was lifted at the rate of 8,000 gallons per hour into the cistern before mentioned. The water has been analysed, and pronounced to be of great purity. The capital outlay has been £2,000.

◆

A new organ has been erected in the parish church of St. Mary, Handsworth, Staffordshire, at a cost of about £1,300. The builders are Messrs. Gray and Dawson, of Pratt-street, London. The great swell and pedal organs are placed in the north transept; the choir organ and console are in the chancel. The action is tubular pneumatic throughout, and the blowing is effected by hydraulic power.

STATUES, MEMORIALS, &c.

Winchester.—The 500th anniversary of the Foundation of Winchester College and of the inauguration of public school education in England will be permanently commemorated in a double form—firstly, by the completion of the unfinished chantry in Winchester Cathedral, in which rests the tomb of William of Wykeham; secondly, by the erection of some memorial buildings at Winchester College. It has been decided to leave untouched every bit of existing work in the founder's chantry; simply to place sculptured figures in the vacant niches of the altar screen. This work is now being carried out by Mr. G. Frampton, A.R.A., under the direction of Mr. J. T. Micklethwaite, F.S.A., of Westminster. The memorial buildings are rapidly rising. They are intended to cultivate and develop various wholesome interests which lie outside the ordinary school curriculum, including a love of natural history, "love of art and architecture," love of archæology, including especially the history of the college and city of Winchester. The architect is Mr. Basil Champneys. Towards the cost about £8,000 has already been subscribed.

CHIPS.

The district council of Llandudno adopted, on Monday, a report by their engineer, Mr. E. Paley Stephenson, recommending that a new 15in. main pipe be laid in four portions in four successive years, the first portion being from Caelum to Ddol Bridge to the summit of Croesau Hill, a distance of 5,444 yards.

At a general meeting of the Institute of Painters in Oil Colours, Piccadilly, held on Wednesday evening, Messrs. George W. Joy, W. Douglas Almond, and A. D. Peppercorn were elected members.

An exhibition of arts and crafts was opened on Tuesday in the Senate Hall of the Royal University of Dublin by the Lord Lieutenant of Ireland.

The second portion of the Coventry Park Estate, belonging to the Liberator Building Society, was sold on Tuesday at Winchester House, and realised £24,655. The first portion realised £69,415 last month. Since then Mr. Douglas Young, of 51, Coleman-street, has sold a portion by private treaty for £3,600, making a total realisation of £97,665. On Tuesday only two lots were unsold.

A receiving order has been granted in the case of Frederick Stephen Short, of Parkstone, Dorset, architect and surveyor.

The Peterhead Harbour trustees were officially informed on Monday that the Board of Trade had refused to sanction the modified suggestions of Sir A. M. Rendal, engineer for the Public Works Loan Commissioners, recommending the spending of £35,000 on the deepening of Port Henry Harbour and the improvement to the entrance to the North Harbour, but that the Board would adopt the original plan by Mr. Shield, engineer for the Harbour of Refuge, which entails an additional expenditure of £8,000. The trustees resolved to accept Mr. Shield's plan, and steps were taken to have a revised application for the loan made without delay.

The new board schools, Colwyn Bay, have been warmed and ventilated by means of Shorland's patent Manchester grates and vertical inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

In the case of George Hall, of Leicester, builder, the discharge from bankruptcy has been suspended for four months and fifteen days, ending March 2, 1896.

Mr. Andrew Wilson, son of Mr. Thomas Wilson, engineer, Coatbridge, and at present assistant gas-engineer in the Carlisle Gasworks, has been appointed gas manager for the city of Perth, at a salary of £300.

The Floods Committee of the Bristol City Council have decided to recommend the adoption of Mr. Yabbicom's scheme for dealing with the floods from the Boiling Wells and Cutler's Mills streams, the estimated cost being about £40,000. The decision comes, however, too late to permit of the promotion of the necessary Bill next session, so that at the earliest no action can be taken until 1897.

Arrangements are being rapidly completed for the formation of a Union Club for Edinburgh, and the buildings now occupied by the Albert Hotel, Hanover-street, in that city, and premises adjoining, have been secured for the purpose. Plans have been prepared by Messrs. Dunn and Findlay, architects, which show that, after the alterations have been carried out, the club will contain the usual accommodation of a high-class town club, including dining-rooms, smoking, reading, and billiard-rooms. Members' bedrooms will also be provided. It is estimated that the alterations will cost about £3,000. The committee of management hope that the premises will be ready for occupation by the beginning of April, 1896.

Our Office Table.

In an address on "The Use of the Supernatural in Art," given at St. George's Hall, Langham-place, on Sunday, Mr. T. Wyke Bayliss, P.R.S.B.A., said Art was like the great Angel in the Apocalypse, with the book in its hand of men's thoughts about men. He dealt with the supernatural in some well-known poems, maintaining that the representation of the celestial was legitimate in art. Among all races the agency of the supernatural was frequent both by painter and poet. The Greek sculpture in the Louvre, representing Eurydice being brought from Hades by Orpheus, led by Hermes, was a type of its use. The god would go back to Olympus and be forgotten, but the memory of the two parting at the mouth of Hades, from the essential humanity of it, would remain. Poetry was not so much a cry in our ears as a momentary stilling of the roar of the world; Art was a lifting of the veil. Art gave us a living sense of immortality. When it attempted to deal with the supernatural as something apart from us, it ceased to touch us, and became no more than a curious exercise of the imagination. He contrasted the way in which Milton and Dante used the supernatural, pointing out that the former has created in his great poem no human interest. The life of man was the central theme of art, and the use of the supernatural was only incidental to it. The difficulty was not to find the supernatural in art; it was to find art without the supernatural. Should they shut their eyes to the supernatural, most of the children's story-books would vanish; so would some of Shakespeare's finest plays. The classics would go, and with them the Greek art would disappear, and give place to that of Madame Tussaud's and the National Gallery, a storehouse of empty frames. Art would then indeed become blind.

The experimental boring beside the Bank of England, which was instituted to ascertain the character of the subsoil, in connection with the proposed Central Railway Station and subways, has now been completed. Made earth was found down to a depth of something over 13ft., then came a layer of gravel, then one of clay, then ballast, and at a depth of about 30ft. that good foundation and excellent material for working through—the London blue clay. Nothing of antiquarian interest was discovered in boring. The series of subways will be 15ft. wide, lined with white glazed tiles, and lighted at all hours of the day and night with electric lamps. Short flights of steps will lead to the level at which the booking-office, the staircases, and the four lifts of the railway are placed. Under the public subway another subway will exist, and into that will be collected all the pipes, mains, and telegraph, telephone, and electric-light wires, thus obviating any further need to break open the roads for repair. The station will resemble an island, which will be accessible from all sides. The Central London Railway will extend westwards beneath Cheapside, Newgate-street, and Oxford-street to Shepherd's Bush, and eastwards to Liverpool-street station. Messrs. Fowler, Baker, and Greathead are the joint engineers.

The time allowed by the Standing Orders of Parliament within which to give public notice of the introduction of private Bills for the ensuing Session expired on Wednesday. The total number of Bills now in course of preparation is 170, precisely the same as the number of Bills actually deposited last Session. Of these Bills 62 relate to railways, including electrical and light railways; 24 relate to gas and water undertakings; 37 are promoted by corporations, district councils, and other public bodies; 11 relate to tramway undertakings, including tramroads; five to piers and harbours; and three to dock companies. The remaining number is of a miscellaneous nature. Of the total number of Bills, 23 affect London and the suburbs, a number considerably below the average. These Bills include five promoted by the London County Council, one by the Corporation of London dealing with the subject of markets, three by the London water companies, and two Bills for the construction of new railways between London and South Wales and London and Watford, by way of Edgware. Other Bills affecting London and its suburbs are the Westminster Improvement Bill, Ealing and South Harrow Railway (Extensions) Bill, London Tramways Bill, Metropolitan Railway Bill, and the Metropolitan District Railway Bill, which proposes to connect the Underground Railway with the projected railway to South Wales. The Chester Corporation seek powers for the construction of a tidal dam and works in or across the river Dee and the dredging of the river near the proposed weir. The Midland Railway Bill contains provision for the construction a harbour in Morecambe Bay, and the making thereat of two breakwaters and a jetty.

In pursuance of the decision arrived at by the Government some months ago, formal notice has been given by the Commissioners of her Majesty's Works and Public Buildings that they will, next session, apply to Parliament for an Act to authorise them to acquire, by compulsory purchase or otherwise, certain lands, houses, and buildings within the area bounded on the north by Charles-street, on the east by Parliament-street, and on the south by Great George-street; also to stop up, remove, alter, or divert all or part of Charles-street, Parliament-street, King-street, Great George-street, Boars' Head-yard, Little Boars' Head-yard, Gardener's-lane, Delahay-street, and Delahay-mews, for the purpose of erecting public offices on the site of the thoroughfares mentioned.

The London County Council received and discussed on Tuesday the report of a special committee on reorganisation. The resignation of Mr. De La Hooke, the clerk, was received, and it was resolved to appoint as his successor a gentleman who should be required to devote all his time to the council, at a salary of £2,000 per annum. The debate was resumed on the adjourned report of the Works Committee, in which the actual cost of 89 completed works was set out as £297,621, whereas the final estimate for the same works was £298,294. The actual cost of 27 works completed and certified since March 31, 1895, was £119,166, whereas the final estimate was £122,561. The actual cost of the 62 works previously certified was £178,454, and the final estimate for the same £175,732. The report was adopted without a division.

The Surrey County Council have received a report from the highway committee stating that, in view of the large and increasing expenditure upon the main roads, and of the fact that some of these roads in respect of traffic could no longer be considered main roads, and in view also that a very large number of applications for assistance to district roads with very strong claims would involve a considerable additional outlay, the question should be deferred until the present outlay upon the main roads could be decreased as well by dismaining as by diminishing the cost thereof. It was their intention to consider more particularly which roads should be dismained, and to continue their investigation into the question of decreasing the present cost of maintenance. The committee further reported that they had employed Mr. A. T. Davis, county surveyor of Salop, to make an inspection of the Surrey main roads, and to report whether improved arrangements might not be made with the district councils, or whether the main roads might not be more efficiently and economically administered by the county council themselves. Mr. Davis's report had been received, and would be fully considered, and the committee had resolved to pay him 125 guineas for his services and report. The action of the committee was approved.

A banquet was given at Saddlers' Hall, on Wednesday night, by the Plumbers' Company, the Master, Sir Philip Magnus, presiding. In proposing "The Houses of Parliament," the Master observed that the Plumbers' Registration Bill was not a compulsory measure. Its object was to prevent unqualified practitioners from falsely stating that they were registered when they had not been registered by the Plumbers' Company. The demand for registration all over the country was very large. There were as many as 3,200 students receiving instruction in the scientific principles underlying the practice of plumbing. Only that week, in a letter from the Department of Public Instruction in Sydney, New South Wales, the superintendent asked whether colonial students who had passed the necessary examinations could obtain registration by the Plumbers' Company. The company regarded the movement as of national importance, and hoped to see the Bill passed next session. Lord Shand and Sir Walter Foster, M.P., replied. The other toasts included "The Municipal and County Authorities in Relation to the Public Health Work of the Plumber," given by Mr. W. H. Bishop, past master, and acknowledged by Sir T. Roe, M.P., and Mr. Beardwood, of Dublin. After dinner a conversazione was held, "that personal conversation among the guests might tend to advance the educational and sanitary objects" of the company. It was stated that the objects of the national registration of plumbers are to elevate, by education and registration, the status of the plumber's craft; to give every competent plumber a diploma, which would be recognised throughout the Empire; and to insure by these means the protection of the public health.

For some time past the corporation of Glasgow have been making various experiments with a view to selecting a better material for paving the streets than the present granite setts, but they have all proved failures. The latest trial was a tar-macadamised paving laid down in Gordon and Buchanan-streets. On Tuesday this was lifted, and the streets relaid with whinstone setts as a temporary expedient till the half-yearly paving season comes round in spring. Mr. White, the master of the works, reported on Tuesday that, next to granite, wood had been proved to be the best material for paving in Glasgow. Wood, however, would never last so long in Glasgow as in London, if the Scottish system of horse-shoeing were to prevail here.

At a recent meeting of the Paris Academy of Sciences, M. F. Osmond presented a memoir on the hardening of extra-hard steel, in which it is stated that there is a gradual increase of hardening with increase of carbon up to about 1·3 per cent., but beyond that percentage the steel becomes softer. A method of examining steel by scratching it with a sharp point and using the microscope is described, and it is stated that hard steels consist of two interpenetrating types, one much harder than the other. The statements may be useful to students, but they require much verification.

A practical test of the invention of Mr. G. R. Steward, C.E., of London, for the total abolition of smoke from chimney-stacks took place on Tuesday at the mills of Messrs. J. and R. Snodgrass, Washington-street, Glasgow. The door, which is the principal feature of the invention, is so constructed that the air, in passing through various passages in it, produces a baffle and an eddy, partially delaying the progress of the smoke towards the flue until its proper admixture with the air has taken place. Two other features included in the patent are only necessary when the draught is slight. During the trial on Tuesday the furnaces were stoked twice, the ordinary door being applied to the first stoking and the patent door to the second. In the first instance 12 minutes elapsed before black smoke ceased to be emitted from the stack, while in the latter case no smoke at all was emitted. Ten minutes after the patent door had been applied it was removed, and the ordinary door shut, with the result that black smoke at once made its appearance from the stack. The test, which was admittedly severe, appeared to be successful. The other advantages claimed for the iuvention—that of a saving in the consumption of coal and the maintenance of steam—could only be ascertained after further and more exhaustive tests.

The report of the committee of the Austrian Society of Engineers and Architects on arch tests, which appears in the *Zeitschrift* of the society, will be welcomed by those interested in the strength of brick and concrete arches. The report gives tests of floor arches with spans of 4ft. 4in., 8ft. 10in., and 13ft. 3·6in., representing several varieties of floor construction; besides the tests of bridges 75ft. span and 1—5 rise, a series of tests to determine the strength and elasticity of materials used in these arches, and a calculation based on the results. The conclusions are worth attention, and we may refer to them on another occasion. With a span of 4ft. 4·3in., thickness 2·93in., rise 4·55in. dead load 91lb. per square foot, a concrete arch cracked in the centre with a load of 307lb. per square foot, and a second crack appeared at 716lb. The brick arch of 5·91in. thickness, 5·71in. rise, and dead load of 70lb. per square foot developed a crushing fracture at 716lb.

The "Wy-ling" patent eraser, which Mr. F. L. Streeten has just brought out, is a convenient and efficient steel instrument, in a case adapted for the pocket, and it is both light and strongly made. It consists of a small curved steel file, which can be used to remove any portions of a drawing or MS. needing erasure. For architects, surveyors, and engineers, the "Wy-ling" will, no doubt, prove a very handy companion, as by its aid ink or colour may be readily removed with but little damage to the surface of the paper, provided the tool is used with a light hand, of course.

A new "tramway motor" has been inspected in Glasgow. It is called the Johnston motor car, and is thus described:—"The motive power is high-pressed super-heated steam, produced by means of special oil fuel which is fed automatically to the generator. The engines are of an extremely strong and simple type, capable of developing up to 30 horse-power if need be. These engines are controlled by one lever, which regulates the forward or backward motion of the car, or stops it at will. The car is fitted with two brakes—one hand-brake, worked by means of a screw; the other, a steam-brake, which, in case of an emergency, acts instantaneously. In addition to these ample safeguards, it was pointed out that, by reversing the engines, the car could be at once stopped, even on the steepest incline. The car was shown in running to be thoroughly under control. There was absolutely no noise and no indication of smoke or steam to be seen."

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Engineers. "Ventilation and Warming," by William T. Sugg. 7.30 p.m.
Royal Institute of British Architects. Business Meeting. 8 p.m.

Tuesday.—Institution of Civil Engineers. 8 p.m.
Glasgow Architectural Association. "Acoustics," by Alex McKee. 8 p.m.

Wednesday.—Society of Arts. "Mural Painting, with the Aid of Metallic Oxides and Soluble Silicates," by Mrs. Anna Lea Merritt and Professor W. C. Roberts Austen, C.B. 8 p.m.
Architectural Association. Discussion Section. "Architectural Drawing," by W. Harold Oakley. 7 p.m.

Friday.—Architectural Association. "Scenic Art," by Professor Herkomer, R.A. 7.30 p.m.

CHIPS.

The works of sewerage at Horfield, near Bristol, which have been carried out from plans by Mr. A. P. I. Cotterell, surveyor to the urban council, have just been completed. The cost has been £13,000, inclusive of purchase of land. The contractors were Messrs. Lloyd and Powell.

A portrait of Bishop Temple is to be painted, by subscription among the clergy of London diocese, to be placed in Fulham Palace with those of his predecessors in the see. The commission has been placed in the hands of Professor Herkomer, and the sum of £900 is asked for.

At Wolstanton, Staffordshire, a new Wesleyan chapel, costing £4,500, and to seat 730, has just been opened.

Col. A. G. Durnford, R.E., held an inquiry on Tuesday, at the offices of the Cowpen Urban District Council, Blyth, Northumberland, relative to an application from that authority for sanction to borrow the sum of £3,383 for works of private street improvement, the provision of public offices, and a town's refuse tip. Mr. R. Grieves, surveyor to the council, explained the plans, and accompanied the inspector on a visit to the sites of the proposed works. There was no opposition.

The parish council of Linslade, Bucks, have awarded the first premium for the competitive designs for the sewerage and water supply of the district to Messrs. R. B. Grantham and Son, Northumberland-avenue, London, and the second premium to Mr. H. B. Nichols, of Birmingham. The rateable value of the district is about £20,000, and the estimates of cost varied from about £3,200 to £9,900.

The North Metropolitan Railway and Canal Company will promote next session a Bill to enable them to make a new street in Ratcliff between Medland-street and Noah's Ark-alley, to construct new locks in Limehouse, and also to both deepen and widen the company's existing canal. The new locks are to be constructed near the bridge by which Salmon's-lane is at present carried over the company's canal. They will extend for 20 yards on either side of the existing bridge, and the bridge itself is to be taken down and reconstructed.

The old building of the University of Virginia at Charlottesville, erected from plans drawn by Thomas Jefferson, and the scene of much of his later work, was destroyed by fire a fortnight ago. The University buildings were situated in a village at some distance from any fire department, and the regular water supply was inadequate for dealing with the flames. Nothing, therefore, could be done but to blow up the adjoining buildings, to prevent the spread of the fire.

Trade News.

WAGES MOVEMENTS.

Weardale Quarrymen.—The Weardale quarry owners have decided to concede the advance of 3¾d. per cent. in wages to the whole of their workmen in and about the quarries, from Nov. 4 to April 4 next. The men at the Raisby Hill Quarries, however, will have the advance from the 11th inst. to the 11th April.

A new Congregational church is about to be built at Barmouth. Messrs. Adams and Evans, of that town, are the contractors.

Colonel J. W. Cameron, who has promised to present a statue of the late Ralph Ward Jackson to the town of West Hartlepool, has placed the commission for the statue with Mr. Onslow Ford, R.A.

The omnibus Bill to be promoted in Parliament next year by the Manchester, Sheffield, and Lincolnshire Railway Company will comprise, amongst many other provisions, powers to construct a short connecting line from Harrow-on-the-Hill, through Kingsbury, to Willesden, and to divert the watercourse known as the Brent Feeder in the parish of Willesden.

The Newton Abbot Board of Guardians adopted, on Friday, plans by Mr. Segar for a new workhouse infirmary, and also accepted the tender of Messrs. Bradford at £1,1000 for steam-power apparatus for their laundry.

FAMBRINI & DANIELS,
Manufacturers of IMPERISHABLE CONCRETE MASONRY for
CORNICES, STRING-COURSES, MODELLED PANELS, AND EVERY STONE-WORK REQUISITE.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2135.

FRIDAY, DECEMBER 6, 1895.

SHOREDITCH BATHS AND (PASSMORE EDWARDS) LIBRARY COMPETITION.

THE result of this competition we have already made known in the selection, under the advice of the assessor, Mr. Rowland Plumbe, F.R I.B.A., of three designs, to which have been awarded the premiums. We have made a brief and hurried view of the designs, and can give our readers an idea of the respective merits of the plans. The Instructions to Competitors were full and explicit, and gave a schedule of accommodation for both the library and museum and the baths and washhouses. The commissioners asked for a design for both these buildings combined; but it is urged, with some reason, that one competitor cannot do equal justice to the two distinct divisions of the scheme. The site selected, which is being cleared, is a good one, and is mainly rectangular, its main and shorter frontage being towards Pitfield-street and the longer sides facing Coronet-street and Bowling Green-walk. The front elevation of both baths and library buildings is to face Pitfield-street, which runs north and south. On the north side is Bowling Green-walk, a passage of about 8ft. wide, very suitable as an emergency egress to the entertainment hall or first-class swimming-bath; while on the other side of site, Coronet-street is wider. The designs show arrangements in which one or other of these sides have been utilised for the baths. It was desired that the baths and washhouses should occupy the large space (coloured red in block plan), and the library and museum occupy the area on the north-west corner, coloured blue. Each building had to be provided with areas for light and air, and the competitors had also to consider the "ancient lights" marked on plan. These have not been provided for in all instances. Competitors were to provide basements, or half-basements if necessary, with ample areas for light. Much has been left to their individual judgment in the location of the various rooms, the levels of the floors, the style of architecture; but the general construction of baths, &c., is particularly described and scheduled. All swimming-baths and washhouses are to be top-lighted along, at least, two-thirds of their length, with lantern lights and upright ventilating sashes; to be faced with cream-coloured glazed bricks, with ornamental bands and coloured dadoes in the first-class slipper and swimming-baths; the entrances and corridors and staircases are to be well ventilated, and lighted direct from the outside along their whole length, and must be fireproof; the principal staircases not less than 6ft. wide, and the buildings are to be in accordance with the requirements of the Building Act and by-laws. One of the main instructions is that the first-class bath is to be used for public meetings, and to be built in accordance with the requirements of the London County Council regulations for that purpose. For warming, low-pressure hot-water or steam pipes and radiators are required, the hot water being supplied from the electric-lighting station. The cost for the baths is not to exceed £30,000, including all fittings and decorations, and the outlay for the library is not to exceed the sum of £9,000, including all fittings, &c.

The design awarded the first premium by the assessor, by Mr. Henry T. Hare, A.R.I.B.A., appears, from the brief view we have been able to take, to fulfil the conditions in all essential points, and the façades of both baths and library have been combined and treated as one. Looking first at the plan, the author has placed his large first-class swimming-bath east and west, the end towards Hoxton-square, with the washhouse block along the north side, abutting on Bowling Green-walk, and the men's first-class slipper-baths along the other side. The second swimming-bath, with the slipper-baths for the same class of men, are at right angles to the first, their ends abutting on Coronet-street. The entrances are well separated for the classes of men and women bathers. We find this design preferable to some others in the economy of working. The women's first-class corridor leads direct from Pitfield-street to the swimming and slipper-baths, and by a turnstile arrangement on other side of pay-office, the second-class slipper-baths which divide the two sexes are also accessible; thus the same entrance and pay-office is available for both classes, and the confusion arising between them in some other plans is obviated. The men's entrance on the other side is similarly planned: their first-class corridor leads through a spacious waiting-hall to the large swimming-bath by a separate doorway, also to the slipper-baths, and their second-class corridor to the second-class large bath and slipper-baths, these corridors being kept distinct after passing the pay-office. The waiting and attendants' rooms in each class are conveniently placed. A long narrow corridor between first-class large baths and slipper-baths leads to club-rooms at the east end. The waiting hall, which is convenient and central between the main doorways of large bath, and the men's first-class corridor is top-lighted. In one respect we question the advisability of placing the washhouse block next the Bowling Green-walk side, as it thus intervenes between the large swimming-bath and this means of exit. More direct and better exits from this bath, when used as an assembly hall, would have been secured by making the north-flank wall of this bath the boundary next the walk, and placing the laundry on the other side. The author shows two extra entrances from the large bath to Bowling Green-walk, and these are placed at the ends of the washhouse and ironing-room.

The library block conforms generally to the conditions. There is a wide and spacious entrance near the corner in Pitfield-street, which is emphasised in the elevation; an inner hall gives access to the borrowers' lobby of lending library, 42ft. 9in. by 37ft. 6in. The boys' room is opposite the entrance, and under control, and the news-room, 69ft. by 25ft. 6in., is along the main front, and lighted by windows, the magazine room being connected with it, forming a return side. The lending library is top-lighted. On the first floor a museum is obtained over part of the news-room, lighted by front windows; a reference library over the lending library, and a book-store near it. The planning of the library is compact, and the departments under supervision. We scarcely like the curved counter as shown, and, if possible, the reference-library should be on the same floor as the lending-library, one counter serving both. We do not know whether the schedule has been complied with in all particulars. The librarian's rooms are on the second floor in front. The external character of the combined buildings is suitable; the style adopted is a Gothicised version of English Renaissance, with gables to the main façade, and a high pyramidal roof and flèche over the library entrance at the north end of block, the Bowling-green side being kept low and plain, with a wide arched entrance to laundry and pay-office. The windows are mullioned, and have transoms. A corbelled turret at the north angle is a bold feature, and forms the stair landing internally. The plans and sections are full, and carefully drawn in detail. An open-timbered roof, with lantern light, is shown over the large bath, which has galleries.

The second design, by Mr. A. Hesseil Tiltman, F.R.I.B.A. (which has been removed by the author), displays the work of a gentleman who is a specialist in the planning and design of baths and washhouses. The men's first-class swimming-bath is placed on the north side of site with direct means of exit to Bowling Green-walk—a much more convenient arrangement for its use as an entertainment, lecture, or assembly-hall than others have adopted. Next to it, and parallel, is the second-class swimming-bath: both have their respective slipper-baths attached, and conveniently placed in connection with a central hall and corridor, while the washhouse is allocated to the south side next Coronet-street—a more suitable position as regards the convenience of entrance. Mr. Tiltman has introduced into his plan a feature which he has made his own, and is excellent wherever space is available—we mean the quadrangle, in order to avoid the inconveniences of long and devious corridors, and of having to make so many separate entrances in a small frontage.

The design which has been awarded the third prize, by Messrs. Groll and Todd, has some features in common with the first premiated. The positions of the swimming-baths are the same: the women's first and second slipper-baths are similarly disposed between the entrances, and the men's on the west side of the second-class large bath. The washhouse also occupies a position on the north side of the large swimming-bath, and faces Bowling Green-walk. Looking at the plan, we discover a masterly arrangement in many of the details, as in the entrances and exits to the first-class swimming-bath. These are spacious and convenient, and arranged in such a way that when the large bath is used for entertainments they will afford ample ingress and egress. The main entrances are in Pitfield-street, and are arranged on each side of the women's first and second-class slipper-baths. One corridor gives direct access to the public hall or large bath, another to the baths for ladies, with their waiting-room in connection with slipper-baths, and the third to the women's second-class baths. The men's entrance is at the south end of front, with corridors divided for first and second-class baths. A convenient club-room is shown between first-class corridor for men and their swimming-bath. The corridors are wide and top-lighted, and at the end of large bath a "swimming corridor" is shown, which can be turned into a useful crush-room when entertainments are given. Three end doorways are shown to this bath, and two emergency exits to Bowling Green-walk; these are at the end of laundry, as in the first prize plan. We may remark that the authors have so placed their entrances and exits all in the main street, except the washhouse, that during public meetings they can be used without interfering with the daily routine of the bath and washing departments. In the details we see the authors introduce the "collapsible" partitions between the dressing-boxes, by which the whole area of bath can be made available for entertainments; and they also show how these partitions can be used as a decorative dado when converted into a public hall. This is a good point. The authors have adopted a style which is used largely in the countries of the Zuider Zee, the North Sea, and Baltic provinces of North Germany and Denmark. The materials are red brick and stone dressings, and alternative plain bands of stone and brick. A clock-tower over entrance vestibule to library emphasises this block, and the librarian's entrance is made to project at end of library block, and is carried up as a turret. The baths elevation is rather lower and subordinate. In the library, with entrance in Pitfield-street, the news-room is made, a gabled block of two stories, with Gothic windows in the flank on the north side, the upper story being the lending-library. The museum is in front over the boys' room. The reference-library is placed in the rear, and is top-lighted, and the magazine-room is lighted by open area which is left between the library and baths at the corner. The side elevations are plain, and of brick. We hope to refer more in detail to these designs, and to notice other plans next week.

THE TWO SIDES OF ARCHITECTURE.

RECENT addresses—even those of a presidential character—delivered before the architectural societies—are too contradictory in their views to give the most sanguine a hope of unity of opinion on vital points. Perhaps it is as well it should be so. An external unity may be preserved at too great a cost, and it is better to hear the opposite sides of a question than to imagine we agree on all points. Besides, a question of importance always presents different aspects to different minds—not that all are right, but that by viewing the subject all round we get a far clearer opinion of it than if we studied only one side. The truth may lie somewhere between. We may put side by side the utterances of the Presidents of the R.I.B.A. and the Birmingham Architectural Association. When the President of the Institute tells us that competition is not the way to secure the best architectural result, he is expressing the opinion of the few successful men who have no longer any need of competing—certainly not of the many who still regard it as the only means (rightly and honestly conducted) of eliciting talent among the younger men of the profession. Of course Mr. Penrose represents the privileged few, not the great majority of the profession; nor can he deny that many of our greatest edifices have been erected by men whose designs were selected by the means he condemns. We do not assert that competition as conducted is perfect—far from it; but it is one of the few doors to preferment open to architects when everything and every appointment is controlled by influence. Other professions, like the law, have their prizes; but architecture is one of those in which the chances of distinction are very few, and those only gained by throwing open the prizes to all comers. If promoters, as it is suggested, were to discuss among themselves and settle who the architect should be for any particular work, the chances are that only those who are known men in any given department would be selected, or someone who has made a name, but has no distinctive ability for the work. We hardly think the recommendation one which will commend itself either to the young or unknown members of the profession, or to promoters who are desirous of obtaining the highest possible talent. Would the selection fall to the ablest man; ablest, that is, not in the sense of having been most successful in obtaining clients, but ablest in the sense of producing the best design? Experience has certainly not shown that a committee's decision on the appointment of architect is better than their decision as to a design. But the notion is a comfortable one that if there were no competitions, a larger amount of patronage would fall to those who had already made a name, or that every set of conditions for competition should be drawn up by somebody who represented (*sic*) the *élite* of the profession. The same with assessors. No doubt it would be in accordance with all that is considered right that professional prestige should be consulted in selecting an assessor, though we cannot but have had our misgivings sometimes about his capability in choosing the design of highest merit. When should the assessor be appointed—before or after the conditions are drawn up? Here is another question about which there are two opinions in the profession. Something may be said for the appointment of an assessor before the conditions are drawn up. He can advise the committee; the conditions can be made under his direction in a manner advantageous to competitors; he would see that no unjust conditions are inserted. On the other side, it is justly contended that if the assessor is known to the competitors at the onset, they will be influenced more or less by his architectural bias, or preference for a particular style or plan, especially if he has the power of nominating the architect. If the suggestions of the Institute as given in their "Kalendar" were fully carried out, competition would be very much restricted. Only a few would be invited to compete, and the assessor would select an architect to carry out the work. Under such a rule very few architects could compete.

The President of the Birmingham Architectural Association, Mr. William Henman, entirely traverses the position taken up by the President of the Institute; he believes competition opens the door for men of genius who have yet to make a name, who have no friends or money to help them. Mr. Henman says if we banish competition, the greater evil of monopoly will arise, as there is a natural tendency to give to people who have. The overburdened and well-to-do practitioner is often, as we know, unable to give the attention to the design he desires, and the work is delegated to an assistant to carry out. The owner or promoter is disappointed, and the deserving and talented members of the profession suffer.

On the question of architectural education we find equal want of unanimity. While representatives of professional societies are clamouring for examination colleges and classes on academic lines, many of the leaders of advanced architectural thought have broken with the professional traditions of modern practice altogether. The provincial societies, especially those allied to the Institute, are committed to the business side of architecture. The President of the Northern Association, in his opening address, refers to the public demand for architects who are men of business chiefly. It is quite natural to find a large centre of provincial professional life taking such a view. The public expect the architect to become responsible for many things which the artistic aspirant regards with repugnance. As Mr. Oswald said, by the inexorable laws of exchange the younger men of this sort are forced to clip the wings of their ambition. Valuations, ancient lights, party-walls, arbitrations, negotiations, and the like are the matters which most nearly concern the provincial practitioner. He must be able to deal with and advise on such questions when they arise, although they are the surveyor's rather than the architect's duties. Yet this essentially business development of the profession, so necessary to the provincial practitioner, is a development at the cost of the artistic. We must not shut our eyes to this fact. We cannot make a man a good architect and at the same time equip him in the qualifications of the surveyor. If our rising architects are to be well-informed, "all-round" practitioners, up-to-date in all the subsidiary branches — of jurisprudence, valuations, sanitation, and electricity—we cannot expect them to be cultured artists. The two attainments are impossible, if not conflicting. The promoters of architectural education will have to face this division and prepare for it, if they desire to prevent a schism. We see now two classes of architects—those who are general practitioners, architects and surveyors, and those who confine themselves solely to architectural and artistic work. This breach will be widened if anything is done to advance a programme which promotes only one side of the architect's work.

On the other side, the arguments used appear equally strong. At the School of Architecture and Applied Arts at Liverpool, the other day, Mr. T. G. Jackson, A.R.A., a redoubtable champion, gave expression to the artistic view. He points out the defects of school training and mere classes. He believes, as other leading architects do, that the system of apprenticeship will do more than technical training schools, however useful the latter may be in supplementing the deficiencies of office training. Mr. Jackson says truly, the young student apprentice "must read for himself and study for himself as well." Again, he says, "No training in schools will ever give him the same insight into the proper conduct of an architect's work; nor will any amount of exercise in working samplers, as they may be called, teach him a tithe of what he learns from work to which responsibility is attached—work that has really to be carried out, work that is intended to endure for generations, and which must therefore be right, sufficient, and practicable under the penalty of failure and retribution." There is a fear expressed that the technical school may be relied upon too much. School and office practice are both required; "either needs to be supplemented in a thousand ways which the student must discover for himself, and will go on discovering to the end of his life." We must all admit that the reason of so many of our buildings being failures is because the modern architect is trained on paper only, and seldom personally superintends them; but the old architect lived and worked on the building. Another champion of the same view, Mr. Lethaby, equally repudiates the modern school system of architectural training, and puts in its place workmanship. Design is to be thought about as the natural outcome of work, instead of work as the outcome of design, which latter is the system followed. These conflicting ideals of professional teaching are instructive. They clearly prove the divergent views existing among the profession. The historical development of style and the official programme are useful and valuable additions to architectural training; but our great masters were ignorant of both—they handed down a traditional teaching which was sufficient for all their wants, and they thought and worked out works of architecture which have been models for all ages. But the modern course of training, how to make a living in architecture easily for the largest number, is responsible for the system which, with all its merits and advantages, has its drawbacks. Systematic and co-ordinate studies have been established not only here and on the Continent, but in the great cities of the West, at Harvard and Cornell Universities, at Princetown, Brooklyn, Chicago; but it will be for another generation to prove what the result will be in architecture. It will have to be shown whether architects can be better taught than in the old-fashioned way by apprenticeship and knowledge of buildings and workmanship.

LIABILITY OF CLIENTS.

ACCORDING to a recent decision by a County Court judge, as reported, if an architect prepares plans and specifications for a building which, by some circumstance, is not carried out, he cannot charge his commission, and the client is exempted from payment. If this ruling were general, a client could put an architect to a great amount of trouble and expense, obtain valuable suggestions and plans, and not be liable. Is this the law? When an employer engages an architect to prepare a design for a building, there is implied an undertaking to remunerate him in a reasonable manner. Were it otherwise, very few architects could recover any remuneration should the work from any cause not be carried out. There is one exception—when his remuneration is made contingent on a certain event taking place; as, for example, there may be a contract between the parties, that the plans are to be approved by the employer, or when the architect agrees to make no charge if the tender should exceed a certain sum. But these exceptional cases arise only when there is a contract or agreement between the owner and architect to such effect.

In the particulars of the case to which we have referred, an architect and surveyor of Southampton sought to recover a claim for £20 from a client for plans and specifications in connection with certain premises. A further sum of £2 2s. was claimed for tracing these plans and submitting them to the urban sanitary authority. At the first hearing of the case the judge held that the action of the plaintiff was premature, and gave judgment to defendant without prejudice to other action. From the facts as reported it seems that the plans were prepared at the defendant's request; but that he subsequently altered his mind, and declined to pay for the work done. A great amount of work was involved in the preparation of the plans and specifications; the plans were at first refused by the corporation, but the plaintiff was willing to alter them to comply with the regulations, if the defendant gave his consent, which he did not. It was ruled by the judge that the plaintiff had not carried out his original contract, and he was nonsuited without prejudice. We are not clear from this report of the case whether there was a contingent employment or not, or on what grounds the employer refused to pay for the work done. The ruling of the judge, as it is given, needs qualification. As misunderstandings are often arising from one or the other of the causes alleged, the question is worth consideration. The plans in this case, as in many others, had to pass the urban sanitary authority. It may be asked whether their approval constituted a condition precedent to payment. The law imposes on the architect an obligation to know the law. If he is called upon to prepare plans for premises in a given street under certain by-laws, there is naturally an implied contract on his part to prepare the plans in compliance with such laws, even if it can be shown that the owner wanted a building which could not be built. This principle appears obvious enough when we reflect on the duties of a professional adviser. The client relies upon his skill and experience to avoid any difficulties in the way of building, and expects him to make his plans accordingly, or to inform his client of the law. Notwithstanding these facts, we cannot expect an architect to make plans that will invariably be passed. Borough surveyors have sometimes the habit of making things a little awkward; of requiring the letter of the law to be strictly followed in one instance but not in another; of asserting their authority in a perfunctory sort of manner. Urban authorities or their officers are seldom satisfied with the first application, and thus it happens that the plans have to be altered occasionally, and resubmitted before they are passed. No client can grumble at these unexpected requirements.

Sometimes an employer alters his mind, and thereupon refuses to pay for the plans. Such people are common enough; they do not clearly know what they want from the first, and this is a point which brings us to the question we started with. Is there a contract? When nothing is said about approval of plans there is a presumption that the architect, like other professional men, can claim remuneration at a reasonable amount. A legal authority says: Where the terms of the contract, oral or written, are not specific as to the payment of the architect, evidence is admissible to rebut the presumed undertaking to pay; but such evidence must be strong and clear. The presumed undertaking to pay is generally relied upon by the architect, unless there are circumstances which are contradictory. If it is agreed between the parties that the employer is to decide whether the architect is to be remunerated or not, the architect is not entitled to claim till the employer has decided that he shall be. In such a case the amount fixed by the employer cannot be questioned by the Court. This is the ruling in "Taylor v. Brewer." But such a contract or understanding seldom exists.

In another case, "Rumsey v. N.E. Railway Co.," it was decided that the employer cannot set up the plea that he never intended to pay the architect anything, unless he can prove any agreement that the latter agreed to work for nothing. Such a principle is sound, for, if the contrary were held, it would be easy for anyone to engage an architect and afterwards set up a similar plea. On the contrary, when plans are submitted or a sketch made on approval, as in the case of probationary drawings, the architect cannot claim, and this ruling has been generally accepted. It was decided in the well-known case of "Moffat v. Dickson" that such drawings come within the nature of proposals or tenders, which there is no obligation to accept.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XIX.—BELGIAN RENAISSANCE.

THOUGH the Renaissance took somewhat the same course in Belgium that it did in France, from the very outset there was wanting

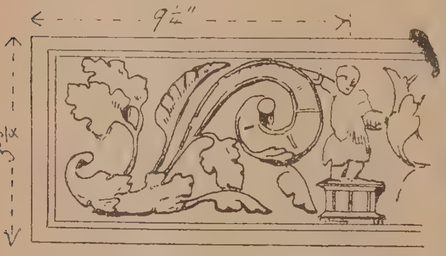
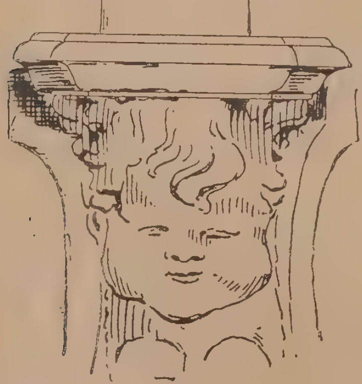
ST. CHARLES, ANTWERP.

the delicacy and the crisp imaginativeness which characterised the French work. It was, for one thing, later in its introduction, and was accepted as complete with scarcely any influence from, or admixture with, the Gothic. Certainly in the Church of St. Gertrude, Louvain, there are Gothic choir-stalls (of which a slight sketch appeared in the Building News for May 31, 1895), which have panels and other rich carvings of Renaissance character—or, rather, of a mixture of the truly Renaissance form of scroll with the natural leaves of the Flamboyant Gothic. Still, the famous doorway to the council-chamber in the Audenarde Hôtel de Ville, in oak, introduced but ten years after the completion of that florid Gothic building, was more characteristically Belgian, in its complete adoption of the new style, and in its similarity to work of the Venetian school, with its carved angle columns and its deeply-moulded and carved panels.

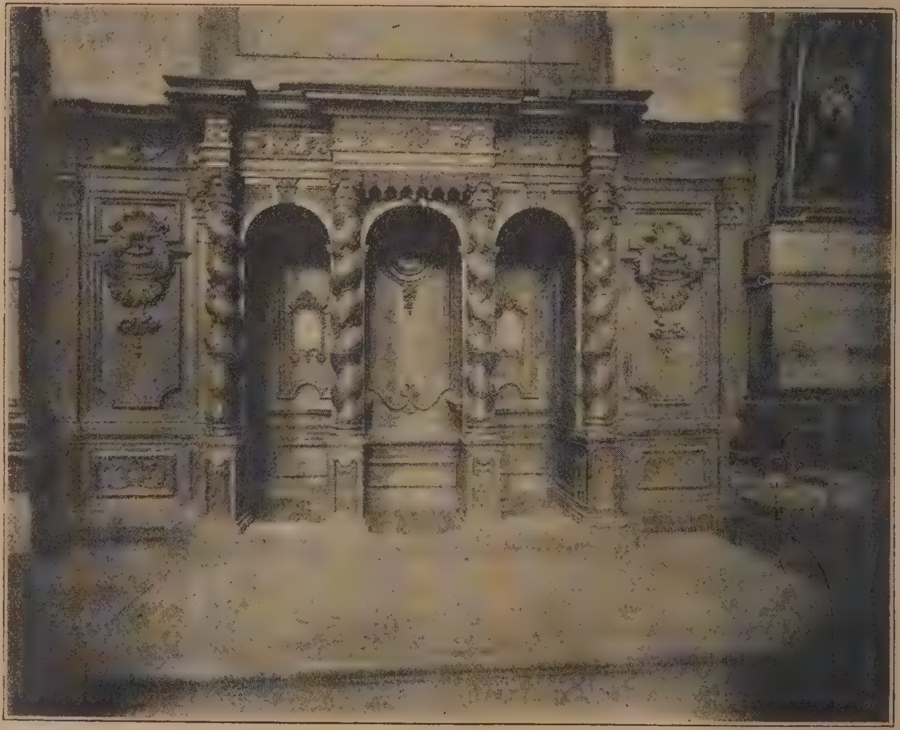


Panel in Choir-Stall, St. Gertrude, Louvain.



Carved Oak Corbel in Confessional, St. Loup, Namur.

Certainly the finest Renaissance church, and possibly also the finest Renaissance building in Belgium, is the Church of St. Loup at Namur, and that also shows inspiration direct from Italy, rather than as filtered through France; and, moreover, exhibits a sturdy originality which is enough of itself almost to mark the Belgian as distinct amongst the Classic derivatives. Erected in the local dark marble, it is a harmonious and well-balanced composition. The Ionic columns, slightly banded, carry small but complete entablatures from which the nave arches spring, and the mouldings of these arches again are in section complete entablatures, and are banded at intervals. Above the arches runs another complete entablature, proportioned to the entire height, and broken round corbels over the columns to form springing for the main arch of the barrel vault, itself intersected by transverse barrels from the clerestory windows. This strongly-emphasised horizontal line of the main cornice may be a trifle too heavy, cutting the building too definitely into two halves; but there can be no question as to the grandeur of the general effect produced by this simple application of the Orders, nor of the beauty of the vaulting, which is ornamented with exceedingly rich cameo carving, the relief in a dull yellow and background of dark grey.



CONFESSIONAL, ST. LOUP, NAMUR.

In the same church is a series of confessionals, all different, carved in oak—the best of much similar work to be found in the country. The orders—Ionic, Corinthian, or Composite—form the basis of each design, the columns or pilasters

INTERIOR OF ST. LOUP, NAMUR (1639).

being raised upon panelled pedestals. In the example illustrated, the columns are twisted and wreathed with natural foliage, and the carving is of the strongly-marked Rococo type referred to in the last instalment of this series; while in others, cherubs' heads are freely introduced.

There is a great deal of Later Renaissance work in Belgium similar to the church of St. Charles at Antwerp—poor, deteriorated stuff, an aggregation of Classic details without thought or harmony or proportion, excellently illustrative of their misapplication. Yet at the same date there were being erected the great chancel screens and altars which are such prominent features in the Belgian cathedrals, in black and white marble, and which, though overpowering in scale, are rarely bad in themselves—one, the screen from Bois-le-Duc, now forming the entrance to the Architectural Court at South Kensington Museum. The example illustrated is the high altar and reredos in Antwerp Cathedral, where its great size, combined with the fewness of its parts, completely dwarfs the rich Gothic choir-stalls, including what is really a lofty bishop's throne.

"BUILDING NEWS" DESIGNING CLUB.

A COUNTRY HOUSE.

THE first subject for the opening competition held this season in connection with our Designing Club has called forth a considerable number of contributors from all parts of the kingdom; but it would be a mistake if we added any assurance as to high-class character of the designs thus received. "A Country House" of moderate size ought to afford a highly attractive and comparatively easy subject for any ordinarily competent designer, and with the more gifted such a problem always may be reckoned upon as giving scope for modesty of taste and skill of invention, not to mention originality of idea. We do not really think that either of the designs sent in on this occasion can be described as an unqualified success, and those which we have placed for the three first positions do not realise what we have described as "A Country House." However, we must take the material received, and make the best choice we find possible, accompanying the same with the above proviso. We place "Owl" first, "Drawde" second, and "Twitty" third.

The following are the instructions issued for the use of competitors, giving the particulars of the accommodation required:—*A Country House*, to cost £3,000. To be built in red brick, and roofs covered with tiles. Stone sparingly used; but carved brick may be introduced for ornamental parts, though not too freely employed. The accommodation to provide three reception-rooms of suitable size, the relative proportions being left to the judgment of each competitor; the hall must be made a central feature in the plan, not be too big, and is not intended for a sitting-room. Seven bedrooms, two of which may be on a second floor and partly in the roof. Offices and bath-room to be provided. The style adopted must be suitable to the material, and a quiet but picturesque treatment is suggested, adapted to the home of a gentleman of moderate means. The entrance front faces the road on the north side; the views from the site are towards the south-west. The height of the ground-floor best rooms to be 12ft., and on the first floor 9ft. 6in. Plans, two elevations, one section, and perspective sketch. The plans may be drawn to scale of 16ft. to the inch; other geometrical drawings to be drawn to scale of 8ft. to the inch. The site is practically a level one.

One of the leading faults shown by the majority of the designs is a failure to realise the needs and habits of a country gentleman, most of the plans being far more adapted to a suburban type of residence, while some resemble too nearly the humdrum Cockney villa quite innocent of artistic character, and cramped as well as pretentious on plan. "Owl" is the best, taking one thing with the other, and, moreover, he has inspired his design with individuality and feeling. One weak point of his ground plan is the awkward consequences resulting from his octagonal hall, and although there would have been no serious objection to such a form being adopted, it must, even by "Owl" himself, be admitted that the entrances from the hall into the staircase and into the lavatory and servants' service corridor are ungainly. A little more thought would have managed the point to which we take exception. The hall would obtain light from the staircase windows but the lighting would be far from perfect. The connecting shutters between the morning-room and the adjacent reception-rooms might be liked by some persons; but they do not enhance the homelike character so essential to the comfort of a morning-room, which, by the way, would be more convenient if located in a little more retired part of the house instead of facing the front door in full view of every chance caller. In this particular "Owl" evinces lack of thought; but we recognise his endeavour to obviate the commonplace, and his design accordingly is somewhat suggestive. Externally, it is not quite clear how the water is to be discharged from the very pronounced oversailing eaves, though a sort of feature is made of the stack-pipes above the main portal. The breadth and simplicity of the façades deserve praise, but we are hardly so sure that a little more grace might not have been added with advantage. This is not to be mistaken, however, as an indication that we advocate the mere introduction of ornamental features, but rather a desire to suggest more refinement in items of detail, and avoidance of uncouth proportions, such as not infrequently result from too marked a striving after quaintness and originality.

"Drawde" does not distinguish himself by good drawing, and, as a matter of fact, his perspective is ungainly and poor. His plan evinces no little study, and has merit accordingly; but we should do its author an injustice if the leading faults were not mentioned. The need of a good solid cross wall is evident, and the building up of the upper partitions over voids above the drawing-room and hall do not serve to insure the best construction, while the chimney-stacks demand a more solid foundation than that shown by the ground plan at the dining-room ingle nook. The back staircase would be quite dark, as the little window in the servery would at best only give a very little light through the borrowed lights shown. The servants' passages also depend upon glazed doors to the adjoining rooms, and the store would be absolutely dark. The elevation is wanting in character, and lacks dignity. The morning-room is a little too far from the hall door as a small apartment to see business visitors in, and in this respect its position off the staircase is an objection. As a sanctum, however, the room is well placed, and a smoking-room or workroom for the boys of the house could be readily contrived under it in a sort of half-basement. "Drawde" must improve if he is to maintain the position which we have assigned to him on this occasion, for the inequality of the remaining competitors' work has largely contributed to his present success in the matter of our placing this design second in the award.

The design reckoned third in merit is by "Twitty," and in plan is the strongest part of his contribution, for the elevations are commonplace. His third sitting-room is more of a study than boudoir, and it is conveniently situate for callers not desired in the dining or drawing-rooms. The fireplace in the dining-room is located between the window and the door opening into the hall—a most uncomfortable arrangement. The mistress's store is inadequate, and the tradesman's door is too close to the larder. These are minor faults not unimportant, and they sample others which we have hardly space to enumerate; but the "hang" of the plan on all three floors is deserving of recognition. "Monster" follows "Twitty" very closely, because his elevations are better, and so are his drawings. In points for planning he fails. The skew-set front door is awkward, and the entrance lobby immediately inside has a w.c. leading to the left, and a lavatory to the right, without a screen of any sort—most publicly objectionable. The hall is wasteful, and the little box for hats at the far end under the stairs is a curious contrivance. The house outside looks like a country rectory, with some rather good bays; but the perspective cannot be said to faithfully comply with the limitations imposed by the elevations. To go over the faults in the plan would take more space than we have room for. Inequality in the employment of space is the main fault, sumptuous in one part, and cramped in another. Still, "Monster" shows indications of better work, if he will but stick to his studies. "Demetrius" has a more exact idea, architecturally, as to the right kind of treatment for a country house externally, but he fails in details, particularly inside, where his notions are wanting in taste, and the same remark applies to the starved-looking bays to the garden front. Thick walls distinguish the plan where solidity is fairly considered; but massive walls need support—as, for example, over the drawing-room. "Tadpole" pins his faith to a Georgian sort of house, which looks homely and comfortable. His plans, however, are neither. The hall is roomy, but the staircase rises in an ungainly fashion, too much in view of the entry. The dining-room door is in the centre of the apartment, and the drawing-room is too much out of the house, with its door awkwardly set in the angle next foot of stairs, with no regard to the pleasurable grace of convenience, not to mention the lordly dignity, such as the peacocks on the terraced lawn shown in the perspective might be thought to imply. "Tadpole's" upper plan is better, though the w.c. on the top of the stairs is too much in evidence to be conveniently private. "Giles" has the charm of a quiet treatment, and his façades are simplicity itself, which in actuality would look at once at home and hospitable. His plan shows a knowledge, too, of the wants of a country gentleman; but the drawings which illustrate the design are meagre to a degree, giving such a lean look to the whole thing, which is much to be regretted. Flash drawing is not likely to mislead us or captivate our choice; but it really is necessary to make the drawings sufficiently attractive to merit selection. The plans are not free from faults either; for example, the kitchen door is directly *vis-à-vis* with that of the drawing-room. "Country Cousin" has a villa-like garden front to his house, and a more imposing façade towards the road, with a courtyard and sundial to match. His perspective is excessively poor for such a competitor. His plan in some respects is clever; but not one room on the ground floor is actually good. The whole thing is too ambitious and strained in order to obtain effect. "Bloggs" has a queer notion about planning, cramping things singularly together, though if less broken in parts and more studied in detail, the general location of his rooms might be advantageous. At present "Bloggs" needs improving. "La Cigale" is neat and painstaking, but we cannot consider his design quite in harmony with the purpose of the building. The arched heads to the ground-floor tall windows ill accord with the long low ones on the first floor. The plan has distinct merits which we have not overlooked. The dining-room is too square, and the chimneypiece is too near the door. "Ivy" sends a design which looks like a convalescent home, with its arched window to the morning-room and verandah over the entrance. "Queen Anne" comes next, with a façade based upon the Dutch method, and a plan which hardly accounts for the demands which staircases make upon space, else how could the bedrooms over the dining-room fireplace otherwise be contrived as shown? "Once More" has a wide flat space for the roof of his main building, and higher pitched gables at the ends. His plan is not really satisfactory, notwithstanding the space it occupies. "Mac" is industrious and painstaking. His plan, too, is ingenious, and more thoroughly worked out than some; but his elevations do not reflect the character which a country gentleman's house seems to demand. "E." is the author of a compact plan, with a circular hall in the middle of the house, where it certainly would be very dark. The arrangement shows thought, and some originality. The same remark hardly applies to the design of the exterior. "Beckington" is more homely, the south front of his house being the better of the two; but his plans are indifferent, and so is his sketch perspective. "Mandalay" shows with every elaboration each floor of his plan in a workmanlike way, which does him credit; but there is no little loss of space in the back hall and landings over. The façades do not please us so well. "Avis" is more compact in his arrangements; but the tower over the drawing-room bay is the sort of thing always best avoided, even in a casino "Leemo" is more modest in his ideas, although he makes a commonplace design. His loss of space in corridors is most objectionable. "Black-beetle" renders his drawings too much like a chessboard, and his plan is not well contrived—thus, for example, the hall fireplace is within a foot or two of the front door. "Cester's" design looks too much like a Board-school. The plan is the better part of the performance. "Red Lion" draws in so unfinished a way that he scarcely does himself justice, and his plan would be improved by study. "Snap Shot" exhibits no little labour in the get-up of his design, and "M" in a circle devotes three whole sheets to the illustration of his, with the most praiseworthy care to the titles and printing. The hall would be dark, in spite of the well-hole and big window on the second floor. "Albyn" draws in his sky so curiously, that in effect the larger gable of the garden front of his design seems to have no roof behind it. The plan is one of the most practical and well-considered schemes sent in; but we had no choice, with these elevations, to place the design otherwise. "Canary" is old-fashioned in his country builder style, and his perspective sketch is too rough to be worthy of more comment. "Cygnette" is neat or nothing. His house is distinguished chiefly by a big bay to the drawing-room, and bedroom over. The plan is economical. "Balbus" makes a symmetrical plan, which obtains little by the arrangement, and we cannot admire his elevations, with which he has been at no little pains. "Kaffir" comes next, with a disconnected, rambling house, gaining nothing on this acconnt. "Dessinateur" is untidy, and very fond of locating his doors as near the angle of the room as he can squeeze them. The consequence is that wall-space is wasted, and the wall-paper gets dreadfully soiled. "Shafston" shows that he ought to do far better work than this, as there is clearly an evidence of good taste about his design, in spite of the ugly section. We seem to remember something like the arrangement of his plan before. "Dunelm" and "Taffy" come next, and then "Tyke" with three sheets, followed by "Rex," "Veller," "Valhalla," "Worcester," "Dono," "Moor," "Peep-bo," "Thrush," "Venus," "Ovolo," and "Ilex."

MURAL DECORATION.

At the Society of Arts on Wednesday night a paper was read on "Mural Painting," of which Mrs. Lea Merritt and Professor Roberts-Austen were joint-authors. Mr. Holman Hunt, who presided, said that, in the attempt to decorate the Houses of Parliament, made 50 years ago, simple fresco was used, and it was asserted that this had been a failure. The causes assigned were the character of the atmosphere of London, the ground that was adopted, damp in the walls, and salt in the sea sand that was used. There had been several attempts to introduce a new system, and one very remarkable attempt was made by Daniel Maclise in the Houses of Parliament, in his two admirable pictures of "The Meeting of Blucher and Wellington after the Battle of Waterloo" and "The Death of Nelson." Although changes had occurred in both these works, in consequence of chemical action upon certain colours, on the whole they had stood very well. But these changes were so serious, that efforts were made to find an improved method of working. Adolphe Keim, of Munich, after many experiments, invented a process for painting on walls which was a development of the silicate process Daniel Maclise used, but eliminated the mistakes in that process. From the time of Maclise it had been regarded as totally distinct from fresco. Mr. Rivington commended it to attention, and invited artists to make experiments on a small scale. The speaker had tried various methods until he was so far satisfied that he had a fixed determination to adopt it some day in a more important work. Mrs. Merritt had tried it more than any other artist.

Professor Roberts-Austen read the paper, in which the details of the process adopted were fully described as carried out by Mrs. Merritt at St. Martin's Church, Wonersh, near Guildford, and it was shown that it was not the ancient one known as *Buon'fresco*, but an improvement of another process, in which a soluble silicate was the vehicle for painting with colours, which were usually metallic oxides.

Remarks were made by Mrs. Merritt, Mr. Batten, Mr. Walker Reed, Mr. Howland, Sir H. Doulton, and the Rev. J. A. Rivington, vicar of the church of Wonersh.

Professor Roberts-Austen, in answering several questions, said, as a chemist, he believed the work would be durable; but he was afraid that in the atmosphere of London the mellowing hand of Time would be seen. It must be remembered that the paintings described were by Mrs. Merritt, and that the work of the artist in the matter must be greater than that of the chemist.

◆

A spire of granite, 140ft. in height, has been added to the Free Church at Holburn, Aberdeen. Messrs. Brown and Watt were the architects, and Messrs. P. Bisset and Sons the builders.

NOTES ON APPROXIMATE ESTIMATES.*

CIVIL BUILDINGS, WORKS, &c.—(*Continued.*)

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
46. Drains, Stoneware. Laid and jointed in cement on concrete bed 6in. thick, and 12in. wider than diameter of drains, including all bends, junctions, gullies, digging and filling in (but exclusive of manholes, &c.), 4in. diameter	—	—	2s. 6d. per foot run
47. Drains. Ditto ditto, 6in. diameter	—	—	3s. 3d. ditto
48. Drains. Ditto ditto, 9in. diameter	—	—	4s. 0d. ditto
49. Drains. Ditto ditto, 12in. diameter	—	—	5s. 0d. ditto
50. Dredging. In mud or sand, average depth about 10ft. below surface of water	—	—	1s. per yard cube, or 9s. per ton
51. Drill-sheds	4d.	£50	—
52. Driven-tube Wells. (See "Wells")	—	—	—
53. Electric-light Installation. For towns, complete with buildings, plant, and mains	—	—	£7 per lamp of 16-candle power
54. Electric-light Installation. For country mansions or houses, complete, including small oil-engine, dynamo, wires, lamps, &c., for 30 lights	—	—	£300 per installation
55. Electric Tramways. (See "Tramways")	—	—	—
56. Elevators, Hydraulic. Direct-acting, low-pressure, for passsengers, fixed complete, including ram and cylinder, gear, guides, hand-rope, passenger-car with safety apparatus, &c., but exclusive of cost of well-hole, water supply, tanks, and pipes. Travel of car, 35ft. For two persons.	—	—	£220 each
57. Elevators. Ditto, ditto, for 4 persons	—	—	£280 each
58. Elevators. Ditto, ditto, for 6 persons	—	—	£360 each
59. Elevators. Ditto, ditto, for 8 persons	—	—	£450 each
60. Enclosures for Lift-wells. (See "Lift Enclosures.")	—	—	—
61. Exchanges and Offices	9d.	—	—
62. Factories. Plain, except machinery, &c.	6d.	—	—
63. Fence, Iron. As for railways. Height 4ft. Comprising No. 7 lines of galvanised cable strands, with strong wrought-iron standards and earth-plates spaced 6ft. apart, and including No. 12 winding pillars and stays to each mile. Fixed complete	—	—	1s. 8d. per yard run, or £146 per mile
64. Fence, Iron, light, for general purposes. Height 3ft. 6in. Comprising No. 5 lines of galvanised iron wire, with angle-iron standards and earth-plates spaced 10ft. apart, and including No. 8 winding pillars and stays to each mile. Fixed complete	—	—	1s. 2d. per yard run, or £100 per mile
65. Fence. Extra only to the preceding for strong wrought-iron field gate, with No. 2 gate-posts, hangings, fastenings, &c. Fixed complete	—	—	£5 each
66. Filters. Complete as for waterworks, with filter-bed 6ft. thick	—	£33	£3 per yard super.
67. Fitments for Houses, &c., as cupboards, dressers, wardrobes, &c., complete	—	—	£5 each
68. Fives-court, 53ft. by 30ft. Front wall 20ft. high	—	—	£500 each
69. Floating Hospital. (See "Hospitals")	—	—	—
70. Floors, Concrete. Ground floor, 4in. concrete, with floated and finished surface, including 6in. of broken brick rubbish underneath, digging, &c.	—	£2 8 0	—
71. Floors, Concrete. Ditto ditto, but surface finished with Staffordshire tiles in cement	—	£5 15 0	—
72. Floors, Concrete. Above ground story, 6in. concrete, with floated and finished surface, including rolled-iron joists, centring, floating concrete soffit with lime, putty, and whiten, two coats	—	£7 10 0	—
73. Floors. Wood. Ground-floor, 1¼in. deal, wrought, ploughed, and tongued, including joists, plates, skirting, 4in. of cement concrete on 6in. of broken brick rubbish, excavations, hearths, &c.	—	£6 3 0	—

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
74. Floors, Wood. Above ground story, 1¼in. deal, wrought, ploughed, and tongued, including joists, plates, skirting, lath and plaster ceiling to under side of floor, plaster cornice not exceeding 12in. girth; whiten 2 coats, &c.	—	£7 7 0	—
75. Forge and Shoeing Shed, complete.	6½d.	—	
76. Free Libraries, public	8d.	—	—
77. Gas-mains. Laid complete, including coating with Dr. A. Smith's process, lead joints, digging, filling, &c., in common ground, clay, or gravel. The trenches to be deep enough to allow top of pipes being 18in. below surface of ground. (See Table)	—	—	—

Analytical Table of Average Cost of Cast-Iron Gas-Mains per Yard Run, laid Complete.

Diameter of main.	Cost of mains, including bends.		Cost of lead for joints.		Cost of laying and jointing mains, including digging, cartage, &c.		Total cost per yard run.	
Inches.	s.	d.	s.	d.	s.	d.	s.	d.
2	1	6	0	1½	0	10½	2	6
3	2	4	0	2	1	0	3	6
4	3	4	0	2½	1	1½	4	8
5	4	6	0	3	1	3	6	0
6	5	8	0	4	1	4	7	4
8	8	2	0	5	1	5	10	0
10	11	3	0	7	1	7	13	5
12	14	3	0	11	1	10	17	0
15	19	9	1	3	2	6	23	6
18	26	3	1	[illegible]	3	6	31	3
24	37	6	1	10	5	2	44	6

	Per foot cube.	Per square of 100ft. super.	Per unit.
78. Gas Supply. Including brackets, pendants, service pipes, stop-cocks, digging, &c., but exclusive of meters and gas-mains	—	—	£2 per light
79. Gates. Entrance. As for public institutions, parks, &c. Comprising No. 2 ornamental stone piers 12ft. high, with concrete foundations, &c., and one pair of ornamental iron gates 16ft. 6in. wide and 10ft. high, fixed complete, with all fittings, &c.	—	—	£160 each
80. Gates. Add to preceding item for each side gate. 6ft. wide, and including stone pier. Complete, with all fittings, &c.	—	—	£80 each
81. Gates. Entrance. As for avenues or villa residences. with No. 2 iron pillars and one pair of gates of a plain character. Gates 10ft. wide by 5ft. high. Complete, with all fittings, &c.	—	—	£26 each
82. Gates. Add to preceding item for each side gate, 4ft. wide, and including iron pillar or gate-post for same. Complete, with all fittings, &c.	—	—	£9 each
83. Grates, including Chimney-piece, for bedrooms, &c.	—	—	£6 each
84. Grates, for living rooms, &c.	—	—	£14 each
85. Gymnasiums	5d.	—	—
86. Hedge, quickset, planted complete	—	—	1s. per foot run
87. Hospitals, General, including administrative buildings, &c.	8d.	—	£380 per bed
88. Hospitals, Infectious, floating, including moorings. Float of iron cylinders with timber decking, wards, and all adminstrative buildings	—	—	£500 per bed
89. Hotels (first class)	1s. 4d.	—	—
90. Hotels (second class)	1s. 0d.	—	—
91. Hotels (third class)	9d.	—	—
92. Houses. (See "Mansions")	—	—	—
93. Infirmaries. (See "Hospitals)	—	—	—
94. Kitcheners, including chimney-piece, complete	—	—	£17 each
95. Laundry and Wash-house, complete	9½d.	—	—
96. Lavatories, as for public institutions, &c., complete with iron brackets, slate top, earthenware basin, brass fittings, waste, &c., but exclusive of water supply, walls, roofs, &c.	—	—	£6 per basin
97. Lavatories, cabinet, as for private houses, complete with marble top, earthenware basin, waste, &c., but exclusive of water supply	—	—	£10 each
98. Libraries, Public (See "Free Libraries")	—	—	|

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
99. Lift Enclosures. For dinner lifts, including proper fir framing, deal matchboarding and doors or shutters to openings	—	—	10s. per foot in height
100. Lift Enclosures. For warehouse lifts, ditto ditto ditto.	—	—	15s. per foot in height
101. Lifts, Hand, Single, Dinner. For hotels, clubs, private houses, &c.; fixed complete, including gear, cage, guides, ropes, &c., but exclusive of inclosure for lift-wells. Travel of cage, 15ft.; size of cage, 1ft. 6in. by 1ft. 6in. by 2ft.; to lift 56lb.	—	—	£20 each
102. Lifts, Hand, Single. Dinner. Ditto ditto ditto. Size of cage, 2ft. 6in. by 2ft. by 2ft. 6in.; to lift ¾cwt.	—	—	£24 each
103. Lifts. Add to preceding items for every additional foot of travel	—	—	4s. per foot of travel
104. Lifts, Hand, Double, Dinner, or Parcel. Fixed complete, including gear, cage, guides, ropes, &c, but exclusive of inclosure for lift-well. Travel of cage, 15ft.; size of cage, 2ft. 6in. by 2ft. by 2ft. 6in.; to lift 56lb.	—	—	£35 each
105. Lifts. Add to the preceding item for every additional foot of travel	—	—	5s. per foot of travel
106. Lifts, Hand. Hospital or Infirmary. Fixed complete, including gear, wrought-iron open cage, with safety apparatus, guides, ropes, &c., but exclusive of inclosure for lift wells. Travel of cage 15ft. Size of cage 7ft. by 4ft. 6in. by 7ft. To lift 7cwt.	—	—	£90 each.
107. Lifts. Add to preceding item for every additional foot of travel	—	—	6s. per foot of travel
108. Lifts, Hand. Luggage or Warehouse. Fixed complete, including gear, cage with safety apparatus, guides, ropes, &c., but exclusive of inclosure for lift-wells. Travel of cage 15ft. Size of cage 4ft. by 3ft. by 5ft. To lift 2cwt.	—	—	£35 each
109. Lifts. Ditto ditto. To lift 5cwt.	—	—	£45 each
110. Lifts. Ditto ditto. Size of cage 5ft. by 4ft. 6in. by 5ft. To lift 10cwt.	—	—	£55 each
111. Lifts. Add to preceding items for every additional foot of travel	—	—	5s. 6d. per ft. of travel
112. Lifts, Hydraulic. (See "Elevators")	—	—	—
113. Lightning Conductors. Fixed complete, including copper tape conductors, lightning-rods, clamps, holdfasts, &c. (All parts above ground to be measured)	—	—	2s. per foot run
114. Lightning Conductors. Add for each shallow earth connection, including copper conductors, broken coke, &c.	—	—	£5 each
115. Lightning Conductors. Add for each deep earth connection, including copper conductor, wooden drum, &c.	—	—	£10 each
116. Locks. For canals	—	—	£3,000 each
117. Maltings. Complete	2½d.	—	—
118. Manholes, Disconnecting. As for house-drains, not exceeding 6ft. deep, including concrete bottom 18in. thick, one-brick sides, disconnecting trap, glazed channels, iron manhole cover with stone curb, fresh-air inlet, complete, including digging, &c.	—	—	£12 each
119. Manholes, Inspection. As for house-drains, not exceeding 6ft. deep, including concrete bottom, one-brick sides, glazed earthenware channels, iron manhole cover with stone curb, and all digging, &c.	—	—	£8 each
120. Manholes. Add to the two last items for every additional foot in depth	—	—	12s. 6d. per foot in depth
121. Mansions or Houses. (First-class.) Main building	1s. 3d.	£110 (Average height of rooms 17ft.)	—
122. Mansions or Houses. (Ditto ditto), servants' offices	8d.	£42 (Average height of rooms 11ft.)	—
123. Mansions or Houses. (Second-class.) Main building	10d.	£55 (Average height of rooms 12ft.)	—
124. Mansions or Houses. (Ditto ditto), servants' offices	6½d.	£30 (Average height of rooms 10ft. 6in.)	—

BOOKS RECEIVED.

Our Homes, by R. BARRY PARKER, architect (Buxton), is a reprint of the articles and illustrations which have appeared in the BUILDING NEWS as a portfolio, now to be had of Messrs. B. T. Batsford, of High Holborn. The articles have been revised, and may be read with profit and interest by all who desire to make our cottages home-like and artistic, and to lift the average dwelling out of the speculative builders' groove. Mr. Parker is justified in saying "that the farmhouse kitchen has an artistic value beyond that of the average drawing-room," because there is truth and honesty about it; he also declaims justly against the over-decoration and the ordinary room, against manufactured ornament, over-furnishing, and the like, all of which are abominations to the real artist, and his sketches or studies of interiors are helpful in showing how the home may be made honest and artistic. We quite agree with the remark that the accessories and things necessary in a room should be made visible and decorative; that things like latches and locks, instead of being let into the doors, should be made decorative. And again, the smallest dwelling or cottage is made to mimic a large house—only the rooms are reduced. Why not do with fewer rooms that one can turn in, and make the hall a room for the family, as it once was? But we have said enough to indicate the scope of the author's remarks on these and other details. The author's ideas are sound, and are worth attention, but some of the sketches hardly do them full credit.——*The Essex Review*, edited by EDWARD A. FITCH, F.L.S. (Chelmsford: Edmund Durrant and Co.), contains, as the chief features of the current quarterly issue, an illustrated article by Fred Chancellor, F.R I.B.A., on the quaint parish church of Navestock, with its picturesque 13th-century tower and spire, entirely constructed of oak timbering; also an account of "The Cistercian Abbey of Stratford Langhorne," by J. A. Sparvel Bayley, and a continuation of George Rickwood's "M.P.'s for Colchester." The notes and queries publish a good deal of information of interest in the county.——*Modern Farm Buildings*, by A. DUDLEY CLARKE, F.S.I., (second edition, revised; London: B. T. Batsford, 94, High Holborn) is a second edition of Mr. Dudley Clarke's useful work on farm buildings, which we noticed a few years ago. In this brief notice we can only remind our readers of the practical and comprehensive character of the treatise, which deals with the arrangement of homesteads; these are illustrated by a "text plan" of buildings for an arable farm which received the silver medal at Kilburn, the "Surveyors' Institution Design" for buildings for a 400-acre farm. Dairy farms, remodelling old homesteads, food department, cowhouses, feeding stalls and boxes, open stackyards, covered yards, stables, piggeries, dairies, &c., are each described in detail, and illustrated by details. The plans are well selected, and drawn to a good scale, and the detail plans of stalls and feeding passages, stables, open and covered yards, and the sections of buildings, roofs, mangers, &c., are useful. As an elementary work on modern farm buildings, Mr. Clarke's book will be particularly welcome to all architectural students, and to all in charge of landed estates, and it is now one of the textbooks recommended by the Surveyors' Institution to all students preparing for their examinations.——*How to Write the History of a Parish*, by J. CHARLES COX, LL.D., F.S.A. (fourth edition; London: Bemrose and Sons, Limited), is a very useful little volume for local historians, giving them valuable hints relating to manorial and ecclesiastical facts. A very useful feature of the book of Dr. Cox is the list of names of the best handbooks for reference, so valuable to the topographer. The author's work, "Notes on the Churches of Derbyshire," is a sufficient proof of his experience and ability. We have in this handbook brief hints where to look for specific information as to records, manuscripts, printed books, &c. General indexes for a series of volumes save time and labour, and we have a list of these given, as the volumes of the *Archæologia*, *Archæological Journal*, and of various other societies. *Notes and Queries*, *The Reliquary*, *The Antiquary*, *Gentleman's Magazine* (edited by Mr. G. L. Gomme) are mentioned as worthy of search. Of course, the Public Record Office in Fetter-lane is one great source of information as to all national documents; next we have the British Museum, Lambeth Library, the College of Arms, Guildhall and Bodleian Libraries, &c. The chapters on Prehistoric Remains, Roman-British Period, Anglo-Saxon Remains, Civil or Domestic Architecture, Church History, &c., are well worth perusal, as they are full of useful data and suggestions. Every prospective local topographer and historian will find Dr. Cox's book invaluable as a guide to the bibliography, records, and remains of any locality.

◆

BUILDERS' BENEVOLENT INSTITUTION.

THE election of three pensioners on the funds of this charity took place on the 28th ult., at the offices of the Institution, 35, Southampton-row, Bloomsbury-square. Mr. J. Mowlem Burt, J.P., D.L. (President), occupied the chair, and amongst other friends of the Institution there were present Mr. J. T. Bolding, Mr. T. Stirling, Mr. T. Stirling, jun., Mr. T. F. Rider, Mr. J. Howard Colls, Mr. C. Bussell, and Mr. F. Foxley. There were three vacancies for pensions—viz., for two men and one woman, there being three male and five female applicants.

At the close of the poll, the scrutineers, Messrs. T. Stirling and T. F. Rider, announced the result, which was as follows:—William Langridge, aged 76, builder, 18, Dorville-road, Hammersmith (first application), 1,817 votes; Thomas Warne, aged 68, builder, 114, Brecknock-road, N. (first application), 1,216 votes; Arthur Fuller Smith, aged 65, builder, 53, Mayfield-road, Dalston (first application), 109 votes; Mary Ann Healing, 20, Curtain-road, aged 65, widow of Samuel T. Healing, builder (sixth application), 850 votes; Maria Elizabeth Powell, 281, Albany-road, Camberwell, aged 62, widow of G. T. Powell, late a pensioner of the Institution (third application), 2,702 votes; Mary Ann Bowley, Tyler's Cottages, Ball's Pond, aged 68, widow of J. Bowley, late a pensioner of the Institution (second application), 763 votes; Eliza Ellis, 46, James-street, Oxford-street, aged 76, widow of E. G. Ellis, builder (second application), 1,428 votes; and Ellen Batchelder, Camden-road, Carshalton, aged 62, widow of Charles Batchelder, builder (second application), 723 votes. The successful candidates were, therefore, William Langridge, Thomas Warne, and Maria Elizabeth Powell.

Votes of thanks were passed to the chairman and the scrutineers, and the proceedings terminated.

◆

A new Baptist chapel and Sunday-schools are about to be built in Manchester-road, Bury, Lancs. Mr. Harry Whitaker, Scotland-road, Nelson, is the contractor.

The Archbishop of York consecrated on Nov. 28 the new church of St. John at South Bank, near Middlesbrough. The church replaces an iron structure which has been in use for over 20 years, and accommodates 700 adults. The cost has been about £4,300, exclusive of an intended lantern. The church occupies a prominent position at the corner of Normanby-road, and is in the Early Gothic style. The architect is Mr. J. M. Bottomley, of Middlesbrough and Leeds.

A memorial chapel has been added to the north side of the chancel of St. Andrew's parish church, Boreham, near Chelmsford, over the private tomb of the Tyrell family. It is Decorated in style, in keeping with the church, and is built of rubble, with moulded stone dressings.

At St. Mark's Church, Reigate, new fittings were dedicated on Friday last. They include a credence table and sedilia, both of 14th-century character, and carved in Bath stone, a chancel screen of Staffordshire alabaster, filled with sculptured figures of Castellino marble, and a pulpit of English oak and teak. All these works have been carried out by Messrs. Harry Hems and Sons, of Exeter, from designs by Mr. C R Baker-King, F R I.B A, of Spring-gardens, S.W.

The chapel of Our Lady in St. Osmond's R C. Church, Salisbury, has been beautified by the erection of a reredos and of a canopy over the statue of the Madonna. The screen in front consists of old oak work supposed to have belonged to a church in the neighbourhood some 300 years ago. The canopy above has been carved in oak by Mr. W. M. Batt. The pinnacles and crockets are gilded, and the ground work is blue, to correspond with the other portions of the altar, which is now rendered complete.

After a long discussion, the town council of Reigate passed a resolution at their last meeting approving the desirability of providing municipal buildings for carrying on the work of the corporation, and authorising a committee to suggest sites for the same. During the meeting it was asserted that there was no other corporation in the kingdom without a municipal home.

OBITUARY.

WE regret to announce the death of Mr. CHARLES THOMAS LUCAS, the senior partner in the eminent firms of Messrs. Lucas Brothers and Messrs. Lucas and Aird, railway and general contractors, of Great George-street, Westminster, and Belvedere-road, Lambeth. Mr. Lucas, who was in his 76th year, had long been ill, and died on Wednesday last at his country residence, Warnham Court, near Horsham. We gave his portrait in our issue for March 28th, 1890. The funeral will take place at Warnham to-morrow (Saturday) at 1 p.m.

MR THOMAS CUNDY, F.R.I.B.A., who recently died at Chichester-terrace, Brighton, was born in London in 1821. Both his father and his grandfather were prominent members of the same profession After being at Eton and subsequently a pupil in the office of the late Mr. Thomas Cubitt, he was associated with his father in various architectural works in the Metropolis and elsewhere. On the retirement of the latter from active work, Mr. Thomas Cundy devoted himself in great measure to church architecture, designing the church and schools of St. Barnabas, Pimlico, for the Rev. W. Bennett; St. Paul's, Wilton-place; St. Gabriel's, Warwick-square; St. Mark's, Hamilton-place; Holy Trinity, Blomfield-road; St. Michael's, Chester-square; and other churches and schools in the country. For many years surveyor to the London estates of the Duke of Westminster, he designed the improvements on the Grosvenor estate, carried out between 1863 and 1868, and introduced a Continental type of building, including, among other features, the Mansard roof.

THE death took place on Monday night, from heart-disease, of ex-Bailie JOHN YOUNG, architect and engineer, of Perth. Deceased, who was in his 70th year, up to last November had served six years at the council board of Perth. He received his training as a civil engineer and architect under his father, and his name in recent years was associated with several large undertakings in the county and elsewhere. Mr. Young acted as engineer in the construction of the Crieff and Comrie Railway. He was a member of the Dundee Institute of Architecture.

◆

CHIPS.

The peal of six bells in the parish church of Stisted, near Braintree, has been rehung and refitted by Messrs. H. Bowell and Son, of Ipswich.

The collection of oil-paintings in the City Art Gallery, adjoining the Guildhall, has been enriched this week by the addition of a portrait, by G. Patten, R A., of Sir Edward Banks, the builder of London Bridge. The picture has been presented by the City Chamberlain.

A new Primitive Methodist chapel, with lecture-hall, numerous vestries, and caretaker's house, was opened at Lancaster on Wednesday week. The buildings are entirely faced with stone, and the chapel will seat between 600 and 700 people. The cost of the whole has been £2,600. Mr. J. D. Mould, of Manchester, was the architect.

The congregation of Lady Glenorchy's, Edinburgh, have resolved to introduce an organ into the church, and an order for an instrument has been forwarded to Messrs. Forster and Andrews, organ-builders, Hull.

Wages at Johannesburg seem to be at high-water mark. Bricklayers recently struck successfully for 22s. 6d. a day.

The monumental bronze group, by M. Bartholdi, the well-known sculptor, representing Washington and Lafayette, was unveiled on the Place des Etats Unis, at Paris, on Sunday. The figure of Washington is barely 10ft. high, whilst that of Lafayette is some inches shorter. The French and American flags, composing the background, rise to the height of about 14ft. The extreme length of the group is 9ft., and the height of the pedestal nearly 12ft. The total height of the monument is about 25ft. Lafayette, who is in the act of descending a slight slope, is represented as warmly pressing Washington's hand.

The Duke of Westminster opened, on Saturday, a new Institute and Workmen's Club, which he has just presented at a cost of several thousand pounds to the parish of Handbridge, one of the most populous working-class districts of Chester.

At Chard, Somerset, on Thursday in last week, a new Wesleyan chapel, built from designs by Mr. F. W. Curwen, of London, was formally opened. It is Gothic in style, has a front to Fore-street, and is seated for 300 persons. Mr. C. Turner, of Honiton, was the contractor, and the cost has been nearly £4,000.

VENETIAN CARICATURES IN ALABASTER.—LADIES' GALLERY, MERCHANT TAYLORS' HALL.—"BUILDING NEWS" DESIGNING CLUB: DESIGNS FOR A COUNTRY HOUSE.—LITTLE MISSENDEN ABBEY, BUCKS.—PROPOSED HOTEL, NEWCASTLE, CO. DOWN.—"LOGGIA" AT THE METROPOLITAN CLUB-HOUSE, WASHINGTON.

Our Illustrations.

VENETIAN CARICATURES IN ALABASTER.

These spirited carvings in alabaster are of Venetian origin, and belong to the splendid collection of Sir Charles Robinson, to whom we are indebted for their loan. They were shown at the New Gallery in the Venetian Exhibition held last spring. These caricatures came from Brescia, in the old Venetian territory, and the sixteen medallions represent, writes Sir Charles Robinson, "'Le Arte de Venezia,' or 'Le Arte gue Vanno per Via,' as I have seen it phrased in an old engraved collection of similar figures published at Bologna, also about the middle of the last century. There seems to have been a fashion for representing the trades and common occupations of the people in the Italian cities in the last century. We also find 'The Cries of London,' about the same time, in sets of engravings. I think these caricatures are quite admirable in their way, and it is a pity there is no clue to their author."

CITY GUILDS.—NO. XIV: HALL OF THE MERCHANT TAYLORS' COMPANY.

In some respects, as is well known, the Ancient Guilds of the City of London are very rich in their possessions of plate and works of art, and among these treasures few things can compare in interest with the historic funereal palls which belong to the Vintners, the Fishmongers, the Goldsmiths, and the Merchant Taylors. The last-named guild is fortunate in owning two of these ancient hearse-cloths, which were used in olden days at the burial obsequies of a brother of the mysteries. Both are of Italian fabric, and are carefully protected by permanently glazed air-tight cases, thus rendering them as far as possible safe from injury; but, at the same time, owing to their fixed position below the skylight in the gallery over the hall, it is impossible to take good detailed photographs of the palls, inasmuch as the plate glass in front of the needlework acts as a looking-glass, and reflects objects in front so much as to obliterate the pall within. This is the reason why our present illustration, showing one of these beautiful hearse-cloths, represents it from the side as part of the general interior of the ladies' gallery, and even in this view the flutings of the pilaster to the right of the fireplace are seen distinctly reflected in the glass in front of the pall. This pall dates from c. 1490 to 1512. In the centre of the border is depicted the baptism of Our Lord, with St. John the Baptist kneeling as he performs the act of baptism, while an angel holds the Saviour's robe. On either side is an Agnus Dei surrounded by rays, with the Baptist holding The Lamb and a scroll, *Ecce Agnus Dei;* then angels bearing the head of the Baptist in a dish, with another scroll, on which is written "Caput iohis Baptist i disco." An open pair of shears is represented at each end of the design. On the shorter borders, one exhibits the Baptist's entombment, his headless body being placed in the sarcophagus by three men in rich dresses, and the other the decollation; and in the centre is the body, with the executioner exhibiting the head, and Salome holding the charger to receive it. The costume of the figures is of the period above given. Salome is dressed in a long gown, over which is a jacket trimmed with ermine. The hearse-cloth to the right is of somewhat later date, 1520-30. The centre is cloth-of-gold velvet: the pattern is in purple and gold, and the outer parts of the field are entirely covered with gold and silver embroidery, while the borders have subjects connected with the life of St. John the Baptist, the patron saint of the Company. Both these specimens of embroidery are of very fine workmanship, and were probably executed in England. The apartment shown in Mr. Sandell's plate is the Ladies' Gallery at the end of the hall, which is seen through the arched opening to the right of the picture. A portrait of William Pitt hangs over the fireplace, but the sheen on the picture prevented its proper representation in the photograph. This illustration completes our series from the Merchant Taylors' buildings, of which description and plan, with details, appeared in our issues for Oct. 25 and Nov. 1, and another view of the Hall on Nov. 22.

"BUILDING NEWS" DESIGNING CLUB: A COUNTRY HOUSE.

(See description on p. 809.)

LITTLE MISSENDEN ABBEY.

Not much remains of the original buildings at Little Missenden Abbey. The house had been altered and enlarged from time to time before it became the residence of the late Mr. Chas. E. Seth-Smith, C.B. Extensive alterations were recently carried out by him from the sketches of Mr. W. Howard Seth-Smith, and the work has been completed since his death. Mr. George Cook, of Great Missenden, has been employed as builder.

NEW HOTEL, NEWCASTLE, CO. DOWN.

This hotel, of which we give one of the premiated plans, was designed for the Belfast and County Down Railway Company, to be erected near their terminus at Newcastle, in Ireland. The position of the hotel was so placed that there would be a charming view overlooking the sea, and slight wings were thrown out to give the front some protection from the winds. Golf club-rooms were attached to the hotel, and fitted up with the most modern fitments, and were so placed as to be near to the golf club grounds. The hotel proper contained large lounge-hall, dining and drawing-rooms, billiard-rooms, rooms *en suite,* and 150 bedrooms. Electric semaphores were attached over each bedroom door, to save servants' time, whilst in the thickness of the bedroom walls next corridors boxes were formed for boots and hot water. A sea-water tank in basement, to fill at every tide with force-pumps up to tanks, was provided for baths. All corridors and every other floor was provided to be fireproof. The materials up to first floor intended to be used was blue granite, rough-faced, but with boasted edges. The projecting portions, as shown on elevations, V-jointed, sufficient to break and emphasise such parts. Above the first floor in the main block the work was in red Belfast bricks, with Irish limestone bands. This design, which was premiated, is by Mr. F. H. Tulloch, A.R.I.B.A., of Belfast, and Mr. Lionel Littlewood, F.S.I., of 49, Doughty-street, Bedford-row, W.C.

"THE LOGGIA," METROPOLITAN CLUB, WASHINGTON.

We give with our illustrations this week a sketch of an apartment from this American club-house, called "The Loggia," which, by reference to the plan shown in the corner of view, will be readily seen is a kind of adjunct to the reading and smoking-rooms. Though not a loggia strictly speaking, it is nevertheless a saloon adapted for use in sultry weather—with three large windows on either side, from which abundance of air and light can be obtained. Its size, too, admits of greater freedom than the more restricted spaces which the reading and smoking-rooms afford. For use in cold weather there is a capacious stone chimneypiece, which is carried up to the ceiling. The walls are finished inside with glazed bricks. Mr. W. A. Potter is the architect of the building, and we are indebted to the *American Architect* for the particulars from which our drawing was made.

CHIPS.

Various improvements are about to be made to the S.W. railway station at Eastleigh, including a high-level footbridge, 167ft. in length, and 14ft. 6in. wide. Messrs. Longley and Co., of Crawley, Sussex, are the contractors for the brickwork.

In the gallery of Zion Baptist Chapel, Slaithwaite, a new organ has been erected by Messrs. James Conachar and Sons, of Bath-street, Huddersfield, and on Wednesday week it was used for the first time.

At the Manchester Consistory Court held on Friday, a faculty was granted for removing the western gallery from St. Paul's Church, Paddington, Lancashire, in accordance with plans by Mr. J. Swasbrick.

Mr. Thomas Goodwillie, late road surveyor under the Wigtownshire County Council, has been elected to a like position at St. Andrew's.

The large five-light Perpendicular west window in Hatfield Peveril parish church has been filled with stained glass. The subjects are the Annunciation, the Visit to Elizabeth, the Song of the Shepherds, the Infant Saviour, the Worship of the Magi, and the Presentation in the Temple. Mr. C. E. Kempe was the artist.

The new seaside resort at East Runton, midway between Cromer and Sherringham is about to be sewered, from plans by Mr. R. M. Parkinson, of Peterborough. The contract has been taken at about £1,000, by Messrs. Bardell Brothers, of King's Lynn.

The Plans and Works Committee of Edinburgh Town Council considered, on Friday, the question of the vacancy in the firemastership of the city, created by the resignation of Mr. Wilkins, and also the relative matter of a retiring pension to that officer. It was resolved to recommend the council to grant Mr. Wilkins a retiring pension of £150 per annum. It was further recommended that the town-clerk should be instructed to advertise for applicants for the post, offering a salary of £300 with free house. Mr. Wilkins' salary was £400 with free house.

A strike of builders' labourers, which has lasted for eight weeks at Felixstowe, has been settled, the men having agreed to recommence work at 4½d. per hour.

At the Sussex Assizes at Lewes, on Thursday in last week, Wm. Meats (47), contractor, formerly of Clacton-on-Sea, where he undertook a contract for widening the pier, but had to file his petition in bankruptcy, pleaded guilty to obtaining credit from various wholesale houses to the amount of £230 without disclosing that he was an undischarged bankrupt. He was sentenced to six months' hard labonr.

According to the plans of Mr. Adrian Collins, consulting engineer, Old Broad-street, a complete installation of electric light is about to be fitted up at the convalescent home of the Middlesex Hospital. The contract price exceeds £3,000.

An adjudication in bankruptcy has been made in the case of Joseph Gay and Arthur Gooseman, trading as Gay and Gooseman, of Great Grimsby, builders and contractors.

A marble bust of Mr. Gladstone, executed by Mr. J. Adams Acton, was unveiled on Friday at the Liberal Club at Leeds.

The foundation-stone of New Town-road board schools being built by the Skirbeck (Boston) School Board was laid on Friday. The new schools will provide accommodation for 393 scholars, and the amount of the building contract is £2,881. Mr. R. H. Bucknell, of Boston, is the architect, and Mr. S. Sherwin, of Boston, is the contractor.

At Lamarsh, on the borders of Essex and Suffolk, the memory of the Rev. C. B. Teesdale, for 42 years rector of the parish, has been commemorated by a stained-glass window, placed in the east end of the round-towered parish church. The subject the Crucifixion, and the artists were Messrs. Britten and Gilson, of Southwark.

About two years ago the Government purchased from the corporation of Manchester a vacant piece of ground in Deansgate, Hardman-street, in that city, for the purpose of erecting new offices. The building has been completed, and has been occupied this week, the business connected with the Excise, stamps, and taxes departments being transferred there from Mount-street, Albert-square. The building is faced with Huddersfield stone, the plinth and columns being of Aberdeen granite. The architect is Mr. Henry Tanner, of H.M. Office of Works; Messrs. Robert Neill and Sons, of Manchester, are the contractors, and Mr. Searchfield is the clerk of works.

The Loggia at the Metropolitan Club House Washington. W A Potter Architect

Building Intelligence.

Birmingham.—At Quinton, near Birmingham, new premises are now completed for Mr. Griffiths, boot and shoe merchant. This building consists of large store-rooms, covered with matchboarding on walls and ceilings, and approached by large sliding doors. To this building a large and commodious residence is attached. The builder was Mr. Plaister, of Harborne. In the same locality a residence with painter's shop and store-rooms attached has been completed. This building is Gothic in style, with moulded brickwork, stonework, and woodwork. A short distance from the above building a new residence, blacksmith's shop, and laundry have been erected for Mr. Downing. This building is also Gothic in style. These two buildings have been erected by Mr. E. Airey; and the architect for the whole was Mr. J. Statham Davis, of Sparkbrook, Birmingham.

Bootle.—The Day Industrial School, which has been provided by the Bootle School Board, was opened on Monday. It is situated at the corner of Marsh-lane and Irlam-road, a large block of buildings originally erected as a convent, and subsequently made into artisans' dwellings, having been converted into the new school. The carrying out of the entire scheme will cost £11,500. The conversion of the old building has been carried out from the plans of Messrs. Sinnott, Sinnott, and Powell, architects, Liverpool and Manchester. Accommodation is provided for 300 children, the boys' department being in the southern portion of the building, while the girls are to be located at the north end. The building contains a plunge bath, arrangements for cooking, separate bathrooms and lavatories for boys and girls, a lofty schoolroom with classrooms adjacent, a drill-room, work-rooms, and a spacious playground.

Cumwhinton.—A new school which has been erected at a cost of £2,745 by the Wetheral School Board was opened last week. The buildings are faced with Cumwhinton stone, with dressings of red Howrigg stone. The roofs are of open timber work in pitch pine, and the wood finishings of the rooms are in yellow pine. The mixed schoolroom is 46ft. by 21ft. 6in. and 16ft. high to the tie-beam of roof, and the room accommodates 96 children. Ventilation is secured by air inlets through the walls, and air-pump extractors at the ridge, controlled by closing valves. The desks are of pitch pine in four graduated heights. The infants' room is 26ft. by 16½ft. and contains a gallery and seats for 46 children. Cloakrooms with lavatories have been provided. The playgrounds, which are each a quarter of an acre in extent, contain gymnastic apparatus. The buildings are fitted with hot-water pipes. A masters' house, built in corresponding style to the school, adjoins. The work has been carried out under the direction of and according to the plans selected in competition of Messrs. Johnstone Brothers, Lowther-street, Carlisle, the style of architecture being Classical Renaissance. The contractors for the school were:—Builders' work, Mr. James Beaty; joiner work and furniture, Mr. Joseph Hindson; plumber work, Mr. W. Forster; slater, Mr. C. J. Nanson; plaster and cement work, Messrs. S. Ferguson and Sons; painter work, Messrs. W. and G. Laidlow, all of Carlisle; heating apparatus, Messrs. Seward and Co., Lancaster. Mr. Robert Ormiston, Carlisle, acted as clerk of the works.

Edinburgh.—For several years important additions have been in progress at St. Mary's Roman Catholic Cathedral, Broughton-street, with the view of improving the internal appearance and of providing additional accommodation. Archbishop Smith sanctioned the first part of the scheme—viz., the addition of the space occupied by vestries, lobby, and gallery stairs, and the erection of the handsome porch in front. These were finished a few years since. Owing to the limited area of the site, difficulty was experienced in arranging for the extensions. The work now completed has been the erection of a new chancel with aisles and a side chapel, and vestries on the site of the former clergy-house at the west end of the cathedral, together with the erection of a baptistery at the south side of the Broughton-street front of the building. A new house for the accommodation of the clergy was acquired at No. 61, York-place, and a passage was built connecting it with the vestries of the cathedral, and passing under Chapel-lane. The sanctuary and high altar have always been situated at the west end of the church, and in connection with the alterations the west gable has been taken down and rebuilt. The new chancel is 50ft. in length by 26ft. in width, with a height to the ceiling of 40ft., the aisles being about 10ft. wide. The new vestries and side chapel are situated between the north aisle and Chapel-lane. The additions have been designed in the Gothic style of a somewhat Late period, so as to harmonise with the existing building. The work has been carried out from the designs of Messrs. Buchanan and Bennett, 24, George-street.—The city authorities have been granted a warrant in Edinburgh Dean of Guild Court to remove a portion of the inclosure wall at the north-east corner of the Observatory ground on the Calton Hill, and build on the site another Observatory building. The new structure, which is destined for the accommodation of the large telescope now at Murrayfield, will be octagonal in shape, and Classical in character, in keeping with the existing buildings. It is to be 35ft. in diameter internally, with a pier for the telescope, and the height to the crown of the dome will be 42ft. The structure will be of stone, with pilasters at the angles. Sir Howard Grubb, Dublin, is making for it a rotating roof of steel, covered with ¼in. thick papier-mache, which will be surmounted by an ornamental finial. It is proposed to introduce an electric motor to revolve the dome. The cost of the new Observatory, the plans for which have been prepared by Mr. Thomas Morham, City Superintendent of Works, is estimated at about £2,200.

Leeds.—A new Sunday school, which has just been built in connection with Richmond-hill Wesleyan Chapel, was opened on Saturday. Mr. G. Danby was the architect. The school, like the house, is of brick, with stone facings. A square tower at its north angle is a conspicuous feature. The school premises consist of a central hall, 64ft. by 35ft., seating 450 persons, with a recessed platform at one end. The cost of the building, including boundary walls, has been £2,900. The works were carried out by Mr. C. Myers (brick and stone work), Mr. T. Harrod (wood work), Mr. T. Barrand (plumbing), Mr. Pennington (plastering), Messrs. Pickles Bros. (slating), and Messrs. Holmes and Co. (heating).

Newcastle-on-Tyne.—The new police station in Scotswood-road was opened on Monday. The buildings have been erected from the designs and under the superintendence of the architects, Messrs. Marshall and Dick, 4, Northumberland-street, Newcastle, their plans having been selected from designs submitted in open competition. The main building is three stories in height, the principal front, facing the Cruddas Park, being flanked with gables rising above the roof of the central portion. The red brick facing is relieved by stone dressings, a deep frieze of stone above the second-floor windows running the full length of the main elevation. The accommodation provides for the housing of 30 single constables, six of whom are auxiliary firemen. An inspector will also reside on the premises, a house distinct in itself being arranged for him, and communicating with the main building only through his office. The ground floor of the main building is occupied by the charge room, parade room, inspector's and sergeant's offices, surgeon's room, six cells, stores, &c. On the first floor are the reading, recreation, and mess rooms, kitchen, boot and drying rooms, one large dormitory, two rooms for the messman, and large lavatory, bathrooms, &c., for the use of the constables. The top floor is occupied by the dormitories and bath and lavatory accommodation. A new feature is introduced by the dividing of the dormitories by partitions about seven feet high, so that each occupant has practically a room to himself, with bed, table, chair, and window. The basement contains the heating apparatus for warming the cells, and a coal store is provided in the yard. The contractor has been Mr. Alex. Bruce, of Newcastle, and Mr. Charles Dixon acted as clerk of works.

Peterborough.—At the annual meeting of the Cathedral Restoration Committee, the report of the executive committee was submitted, in which it was stated that in their last annual report the committee appealed for £4,000 for works certified by the architect (Mr. J. L. Pearson, R.A.), to be urgently required for the safety of the fabric. The response to this appeal had enabled the committee to enter into a contract with Mr. John Thompson, of Peterborough, for the necessary repair to the south gable and the south end of the eastern aisle of the south transept, for the sum of £694. The repair of the eastern and western faces of this transept, the extensive repair of the masonry of the north transept, and the underpinning and repairs to the north-east angle of the eastern chapel could not be proceeded with for want of funds. A sum of £3,000 was still needed for these works. With regard to the west front the committee submitted the substance of Mr. Pearson's report as to the work necessary to secure its safety, the repairs necessitated by the late storm to the spires, pinnacles, and other portions of the west front, which should be undertaken at once, amounting to £850. The cost of the work necessary for the preservation of the west front might roughly be estimated from £6,000 to £8,000. The committee reported that £1,947 10s. 6d. had been given or promised to the work. A contract had been entered into with Mr. J. Thompson for the erection of the necessary scaffolding to the west front for the sum of £385. The committee acknowledged with thanks the gifts of stalls from the Rev. W. H. Cooper and Mr. T. A. Argles. These, with the one given last year by the Rev. Thompson Yates, were now in course of construction, and only one stall remained to be provided to complete the required number. In concluding the report, the committee appealed for £12,000 for the following purposes:—To repair the damage done by the late storm, to secure the safety to the west front, and to execute the repair still needed in the transepts and eastern chapel. Towards the sum £2,644 4s. 11d. had already been promised, and of this amount £1,974 10s. 6d. had been specially devoted to the west front.

CHIPS.

The Archbishop of York consecrated, on Thursday in last week, the Church of St. John the Evangelist at South Bank, Middlesbrough.

A subscription bust of the late Professor Minto, executed by Mr. Joseph Whitehead, of London, has been placed in the library of King's College, Aberdeen.

Ansford parish church, near Castle Carey, Somerset, has this week been enriched by the addition of a stained-glass window in the south aisle. The window is divided into two compartments. In the right is a figure of Bishop Ken, while the left-hand one is occupied by St. Andrew. The figures are surmounted by canopies of the Perpendicular period. The window is the work of Mr. F. Drake, of the Cathedral-yard, Exeter.

St. Chad's Mission Church, which has been erected on the New-road, Rubery, on the Lickey Hills, was dedicated on Saturday. The church is a wooden structure, consisting of nave only, with campanile tower at the west end, and an annexe, which can be separated from the main body by a screen, and used as a Sunday-school. The nave affords sitting accommodation for 200, with provision for 100 more by removal of the screen from the annexe. The style is 15th century Gothic. Mr. Jeffrey Hopkins, of Worcester, is the architect, and Mr. Stanley Broom the builder. The cost, including fittings, has been about £700.

The lessee of the Theatre Royal at Leeds proposes to build a new theatre of varieties near the Bridge in that city. Mr. Frank Matcham, of London, has been appointed as architect, and the estimated outlay is between £70,000 and £100,000.

A bronze lectern was used on Sunday for the first time in the service at St. Cuthbert's Church, Edinburgh. The lectern is the gift of Mr. Alexander Ballantyne, in memory of his wife, who died in 1890. Designed and executed by Mr. D. W. Stevenson, R.S.A., the reading-desk is carried on a pillar of Renaissance design in harmony with the style of the church. The chief feature of the lectern is the figure of an angel with folded wings, which stands below and in front of the desk. The arms are carried upwards over the head, and in the hands, held horizontally, are sprays of palm-leaves and a scroll. The hands just touch the highest part of the reading-desk. The chiton is used as drapery, and the head is crowned with a wreath of olive.

St. James's new Presbyterian church, Alnwick, was opened on Sunday. It occupies the site of an old church, and is designed in the Perpendicular style. At the angle next the road is a tower, carried up to the height of 75ft. with angle turret, traceried belfry windows, and battlemented parapet. The accommodation of the church, including choir, is about 700. The building has been erected from designs from Mr. W. Lister Newcombe, F.R I.B.A., architect, of Newcastle, and the cost has been £4,000.

The Home Secretary has appointed Mr. Alfred A. Hudson a member of the Tribunal of Appeal under the London Building Act, 1894, in succession to the late Mr. Daniel Cubitt Nichols, M.S.A.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—The fourth general meeting of the current session was held on Friday evening last at the Exchange Buildings, New-street, Birmingham, the headquarters of the association, Mr. William Henman in the chair. Mr. C. Nicol was elected a member. Mr. Appelbee then read his paper, entitled the "Conduct of Architectural Competitions." Mr. Appelbee, in the course of his paper, said that, in his view, many competitors of late had not received the consideration they were entitled to, as competitions cost them, as a body, much more than the successful man would receive in commission for erecting the building. In order that a competition may be satisfactory to everyone concerned, it will be necessary, in his opinion:—(1) For the accommodation required to be very definitely scheduled. (2) That no unnecessary restrictions should be made as to where that accommodation should be placed. (3) If any restrictions have to be inserted, such as limit to cost or frontage lines, they should be most strictly adhered to in making the award. (4) And, most important of all, that the means adopted for making the selection shall be such that both promoters and competitors shall be convinced of its justice; and, therefore, willing to abide by it, and that the promoters shall see that it is not to their interest to go contrary to it. To obtain this end, a committee or jury was suggested, and its constitution and advantages over the single assessor discussed. (5) For the remuneration offered both for the competition drawings and services rendered of the buildings erected to be such as architects usually receive. And, lastly, to obtain more publicity towards the close, with a view to preventing bogus competitions, and illustrated these points by some recent examples.

Edinburgh Architectural Association.—The opening meeting of the session of this association was held on Thursday night in last week at the National Galleries on the Mound. Dr. Rowan, the president, in the chair. The President, in his inaugural address, devoted some attention to the question of the education of artists. He directed attention to the possible influence upon their Association of the action of the Royal Institute of British Architects in London in dividing up the whole kingdom into architectural provinces or districts, in which the present societies, to be allied to the central body, would be the respective centres. There was, he pointed out, an essential difference between their Association and others, in respect that while the latter existed almost exclusively for the benefit of architects, the Edinburgh Association existed for the benefit of architecture and the allied arts. For that reason, he considered that their own constitution was preferable, and that the larger the number of lay members they could induce to join them and to take an active part in the management of their affairs, the greater would be their strength and influence. Besides, he thought they knew their own business better than a body 400 miles away. But there was something more serious awaiting their consideration in the Bill now before Parliament of the Society of Architects in London, providing for the compulsory registration of architects. This brought him to the burning question of education and compulsory examination. Those who advocated the scheme said that the ranks were crowded with incompetent and badly-educated men, and that, consequently, the good men and their art suffered in prestige and public estimation, that the public should be protected from this incompetent class, and that the only way to do so was to insist on special education, tested by compulsory examination before one was allowed to begin business. But there were several points of great importance to be kept in view, one of which was that the possession of the creative and artistic power necessary to make an architect could not be discovered by compulsory examination, and another of which was that about 90 per cent. of the building executed in this country was done without the intervention of an architect. So far, therefore, as protecting the public against those who designed and erected buildings was required, it appeared to him that those who erected 90 per cent. of the buildings were the proper subjects on whom to impose a qualifying examination, because at present the public had little or no control in the planning or designing of what they are compelled to buy and to live in. If the business of an architect were to become a closed one—which was no doubt the object in view—its last state would be no better than the present one. The solution of the question seemed to him to lie in the increasingly high standard of education for all classes, and the greater elaboration of the Building and Police Acts and their stringent application by competent officials, alike to the architect, the builder, and the public. No amount of legislation could in the present state of matters protect the public from the effects of bad art. Indeed, by far the greater part of the public did not want good art. They wanted what pleased them, and plenty of it, for their money. Art and those who followed it could only flourish in absolute freedom. In conclusion, the President urged the claims of the Edinburgh School of Applied Art, and directed attention to the good and useful work it was doing. Professor Baldwin Brown afterwards explained a series of limelight views of "The Frescoes by Michael Angelo in the Sistine Chapel at Rome." In lucid fashion he explained not only the general features of the decorative scheme of the frescoes, but, treating their subjects in detail, pointed out their great interest and value as works. On the motion of Sir Henry Littlejohn Professor Baldwin Brown and the President were cordially thanked.

Northern Architectural Association.—At an adjourned meeting of the Association held on Nov. 27 in the Art Gallery Meeting Room, Newcastle, Mr. C. S. Errington, A.R.I.B.A., completed his paper on "Mediæval Mouldings, Features, and Ornament." The paper was illustrated by nearly 200 lantern slides, many of which had been prepared specially for the occasion. Mr. Errington traced the development of arches, jambs, and piers, from the Norman era, comparing the noble example at Durham with contemporaneous work at Ely, Norwich, Peterborough, Gloucester, and Winchester Cathedrals. The Transitional period was illustrated by reference to Fountains, Kirstall, and Selby Abbeys, and the Durham Galilee; while the Lancet period was demonstrated by descriptions of the work at Rievaulx, Whitby, and Fountains Abbeys, Lanercost Priory, and Wells Cathedral. The Decorated period was described and illustrated by numerous examples; and Mr. Errington concluded with a brief reference to the work of the Perpendicular era, which closed in the middle of the 16th century. The lantern was manipulated by Mr. Parker Brewis. A cordial vote of thanks was given to Mr. Errington for his paper.

Society of Antiquaries of Scotland.—The annual meeting of the society was held on Saturday, Dr. James Macdonald, vice-president, in the chair. The office-bearers for the ensuing year were elected as follows:—President, the Marquis of Lothian. Vice-presidents, Mr. Reginald Macleod, Queen's Remembrancer; Mr. James Macdonald, LL.D.; and Mr. J. Balfour Paul, Lyon King of Arms. Councillors, Sir George Reid, LL.D., P.R.S.A., and Mr. J. R. Findlay, representing the board of trustees; the Hon. Hew Dalrymple, Mr. Alexander J. S. Brook, Mr. John Taylor Brown, the Hon. John Abercromby, Mr. Charles J. Guthrie, Mr. Thomas Ross, and Mr. Gilbert Goudie; secretaries, Dr. D. Christison and Dr. Munro; secretaries for foreign correspondence, Sir Arthur Mitchell and Mr. Thomas Graves Law; treasurer, Mr. James Henry Cunningham. During the year twenty-two members, it was reported, had been lost by death, and twenty-seven new members added.

◆

At the Wolverhampton county sessions on Tuesday, William Mee, president of the Operative Carpenters' Society, was granted transfer of a license for a public-house of which he has recently become tenant. Mr. Mee is a Justice of the Peace for the borough, being one of a batch of workingmen magistrates appointed by the late Goverment; but he holds that as the house of which he has been granted a license is outside the borough boundaries, his occupation of it will not interfere with his magisterial duties.

At Tuesday's meeting of the London County Council, a recommendation by the Parks and Open Spaces Committee for the erection of a palmhouse in Battersea Park at a cost of £2,000 was opposed by Mr. Beachcroft, who moved a hostile amendment, which, after some discussion, was carried by 70 to 42 votes.—A Bill prepared by the Parliamentary Committee for the construction of a tramway over Vauxhall Bridge, as reconstructed, was approved. The link of tramway will connect lines on either side of the bridge, which will shortly fall into the hands of the council.

COMPETITIONS.

Aberdeen.—In the competition for the reconstruction of the municipal buildings the town council have appointed Mr. Young, F.R.I.B.A., of London and Glasgow, as assessor at a fee of one hundred guineas and expenses.

Siddons Memorial.—The committee who have undertaken to erect a memorial to Mrs. Sarah Siddons over her grave in Paddington Old Churchyard met on Friday, and, adopting the recommendation of Sir F. Leighton, selected from the models sent in by twenty-one competitors that of a statue designed by Mr. William Brindley, of Westminster Bridge-road. The work is to be executed by M. Chevalier, a French sculptor. The statue will be life-size, and carried out in white marble, the pedestal being of Portland stone. It will represent the distinguished actress in a sitting position, attired in Grecian dress, with a small coronet on the head, from which a veil falls over the shoulders. The cost will be £450.

CHIPS.

The death occurred at Paris, on Sunday, at the age of 72, of M. Charles Comte, the historical painter, who for the last 20 years has not exhibited his works, but has lived in strict retirement, mostly at Fontainebleau.

The London County Council are having the grounds of Lincoln's Inn-fields thoroughly drained, the arrangements in that respect having been previously of the most primitive and inadequate character, and the various paths are being levelled and gravelled. Later on the flower-beds will be overhauled, and in many instances replanted.

The Town Council of Southampton decided at the last meeting to construct a new main sewer from Simnel-street to the town quay, at an estimated cost of £4,000.

A reredos of Caen stone and marble has just been erected in the church of St. Mary, Shotesham, near Norwich. The structure is in the Late Decorated period of architecture, the central portion being carved in high relief with a representation of the Last Supper, after the style of Leonardo da Vinci. An elaborate canopy of pierced tracery and carved pinnacles rises above this, and the side wings form a series of panels with surface tracery in the same style. The work was executed by Messrs. Jones and Willis, of Birmingham, London, and Liverpool.

Mr. J. W. Taylor, F.R.I.B.A., of Newcastle-upon-Tyne, has, through the instructions of the Peoples' Palace Co., Limited, rearranged and reconstructed that building. The quantities were taken out by Mr. George Bell, quantity surveyor, 60, Collingwood-street, Newcastle, and the whole of the work is intrusted to Mr. Alexander Pringle, of Gateshead.

A meeting of the newly-formed Bury and District Master Builders' Association was held at the Grey Mare Hotel, Bury, Lancs, on Thursday evening in last week. Mr. R. Smith presided, and there was a large attendance of the various trades. A preliminary committee was formed for the purpose of drafting rules, and Mr. J. H. Thompson, of Messrs. Thompson and Brierley, was appointed secretary pro tem. of the local association.

Mr. William Johnson, the missionary who, with his wife, was murdered at the Friends' Mission Station at Arivonimamo, last week, was formerly an architect in practice in London, having previously acted as assistant to Mr. Edward Birchall, F.R.I.B.A., of Leeds. In 1871, Mr. Johnson went out to Madagascar, and a year later he married Miss Sewell. For some years he acted as head-master of the Friends' Foreign Mission High School at Antananarivo. He carried out the enlargement of the school buildings, and, besides drawing the plans for the London Missionary Society's High School for Girls, built a hospital which cost between £5,000 and £6,000.

Sir John Gilbert has presented to the Blackburn Corporation fourteen water-colour sketches, with a hope that they will prove of service to the art students of Blackburn, of whom he is pleased to hear so good an account. The drawings are stated to be fine examples of Sir John's earlier work, and of special value to students.

Mr. James Runnalls, of Penzance, an ex-councillor, and one who, as tenant of the Penlee Quarries, had become a large exporter of granite and macadam, died on Friday. Of a speculative turn of mind, and shrewd, and industrious, he turned his attention to the Penlee Quarries, granite from which was to have formed the proposed breakwater for Mount's Bay. Instead of that, in the form of macadam, a huge hole at the base of the hill, which leads to Paul Churchtown, has gone, under his management, to make and maintain thousands of miles of road. He leaves a widow, a son, Mr. James Runnalls, who has long superintended the business, and a daughter.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. F. Woolney.—E. C. B.—W. N. and Co.—Antipodian.—E. S. (Cork).

Correspondence.

PROPOSED NATIONAL AND PROVINCIAL UNION OF BRITISH ARCHITECTS.

To the Editor of the Building News.

> " . . . We hear the fearful tempest sing,
> Yet seek no shelter to avoid the storm;
> We see the wind sit sore upon our sails,
> And yet we strike not, but securely perish."
> —Shakespeare.

Sir,—It would, perhaps, be too much to expect that that which has been neglected for so long should suddenly and spontaneously burst forth, and, presto! become an accomplished fact; that architects as a body should practically recognise the imperative necessity of showing a bold, united front to the enemy, whose name may well be called Legion, and which your correspondent, "One in a Mob," not without reason, despairs of ever seeing vanquished. And yet it is difficult to imagine that, as matters now stand, any thoughtful architect with any love for the well-being of his profession can hold back, and elect to go on still in the old ruts propelled by the obsolete machinery of half a century ago, and content himself to read the times with the aid of a farthing dip, when, with a little exertion, he might enjoy the luxury and brilliancy of the electric light. Is his profound love for antiquity—his deep reverence for Mediævalism—answerable for this?

A friend lately remarked to me: "I think less of architects now than ever I did, and they deserve all they get, and more, if they will not be at the trouble to protect themselves." What could I reply to this home-thrust? I could but acquiesce with the best possible grace at command. Yet I confess it makes one's blood boil to think of it, that even outsiders can express righteous indignation, while we apparently are content to sit in our arm—but not easy—chairs, outwardly indifferent as to how the wind blows.

Referring to your excellent leader of this week as to putting down the sham architect, may I ask who is responsible for his presence amongst us? The great bulk of the evils under which the profession labours and groans has been born of the apathy and indifference of architects themselves, and this example is no exception. Let us look the matter straight in the face and honestly acknowledge, it is we, and we only, that have erred and gone astray. The pseudo-architect is but representative of one of the weeds which have been allowed to grow and seed year after year in our unkempt garden, and whilst almost to a fault looking after our patrons and individual interests, we have, alas, entirely neglected our collective obligations in their most essential points. Don't let us try and escape conviction by throwing the blame on the pseudo-architect—"Lay not this flattering unction to your soul"—nay, every tittle of responsibility rightfully belongs to, and must in justice rest upon, the shoulders of the legitimatist himself. It is useless for the cause to blame the effect. In this case prevention is our only remedy; the question simply resolves itself into whether we elect to suffer another year's harvest of seedlings after this sort or not? And this is but a modicum of the rank undergrowth which is choking, blighting, and retarding the healthy growth of the legitimate tree. Again quoting from your leader "The essential weakness of the profession is its disintegrated state. There seems to be a mutual repulsion between its members, and nothing but gross ill-treatment from outsiders can bring them together." Thank you, Mr. Editor; you have certainly here hit the right nail on the head; grant that it may be driven home and "clinched on the underside." We had heard a great deal lately about the unity of the Empire, let us have a little about the unity of the profession. Let us away with, and for ever, this paltry, contemptible individual nursing of our pet selves, or our particular hobbies, this individual, suicidal exclusiveness, and despicable jealousies; this demon of selfishness, battening, as it does, on our very life-strings, and proving a fatal obstacle in our way to cherish and support all that we are in honour bound to defend and uphold. "Seek not thine own, but another's wealth." And, undoubtedly, imperative and vital as the necessity is for reform to architects themselves, and however great the relief it will afford them, yet it will be as nothing to the benefits likely to accrue to the public at large. And architects, in simple justice, owe it to the public as well as themselves, that a large measure of reform should be introduced, and that speedily. Architects should at least be placed equally upon an honourable footing and equality with the medical and legal professions, and depend upon it this can only be brought to pass by unity in strength and purpose; and which was very ably put forth by your correspondent "W. F. S." last week.

In reference to my letter which you kindly inserted in your issue of the 15th ult., wherein I advocated the uniting of all members of the profession into one solid and united body, and briefly —I am afraid in a somewhat crude manner—suggested one way in which this might be done. May I be permitted to thank those members of the Institute, Association, and others, who have responded to my invitation, to send me their names, and also for valuable information and data. I may state that the forwarding of names implies no further responsibility or liability, as the matter at present is simply in an honorary stage, and it need not cost the sender one penny, as a post-card will meet all requirements. The sending of names is only meant as an individual expression of conviction that the time has arrived when something must be done to protect and raise the status of the profession. In other words, that the time has now arrived when it is imperative that a forward movement be originated by the entire body of architects, and so voiced with such a force as to be irresistable. And who would not participate in such a consummation so devoutly to be wished?

May I ask that those who intend, but have not as yet sent in their names, would do so, and thus facilitate my being able to convey over the responsibility into more efficient, responsible, and fitting hands than mine can profess to be. And also, as everyone must agree, that the movement, to be successful, must, in the first place, be numerically strong. A committee could then be formed, representative of the Institute, Associations, &c., together with representatives of what we may term the *bonâ fide* unattached members of the profession, who will consult as to the forming of a union as above, or whether any other amalgamation or federation and general enlistment would be more desirable; whatever the result, it would then be submitted for approval to the general body. Such an inquiry, at least, could not but have a healthy influence in raising interest, and, let us hope, also a little enthusiasm. And, *sub rosâ*, there is no reason why the President of the Institute should not allow himself to be nominated for and elected chairman, and the presidents of the several associations and societies vice-chairmen; and would not this constitute a true "union of hearts"? Again thanking you in anticipation.—I am, &c.,

Durham, Nov. 30. George Ord.

P.S.—Referring to your correspondent "A.'s" letter of this week, I may inform him, that exactly to the week, 23 years ago, November, 1872, a letter of mine appeared in the Building News, illustrative of a very similar competition case, and every volume since then has kept on repeating the same old story. I am afraid he will not be able to derive much comfort and consolation from this fact; but, nevertheless, it conveys an important lesson, "he that runs may read."

G. O.

TECHNICAL TERMS.

Sir,—Referring to the letter of Mr. W. Simmons, he has probably noticed that workmen sometimes say "purline" for "purlin."

Is not *soffite* the proper word—not "soffit"? A well-known architect and linguist once told me that it was an old French word, meaning the under-side.

I have heard many arguments as to the word "facia," or "fascia."—I am, &c. H. L.

CHIPS.

The West Hartlepool School Board have decided to erect a school in Brougham-terrace, at a cost of £16,522, to accommodate 1,375 children, or nearly £13 per head.

Mr. G. W. Willcocks, M.Inst.C.E., an inspector to the Local Government Board, conducted on Friday an inquiry in the Huddersfield Town Hall, with regard to the application of the corporation for permission to borrow £50,000 for electric lighting purposes. The town clerk explained that the corporation had previously obtained power to borrow £50,000 for electric lighting; but under the order then made their operations were confined to a prescribed area, which did not include several outlying districts within the borough. The present electric works, sufficient for the requirements of the prescribed area, had exhausted the borrowing powers. Mr. A. B. Mountain, electrical engineer, produced plans of the present works, and gave detailed estimates of the cost of the proposed extensions.

The city council of York resolved on Monday to retain the services of Professor Kennedy, F.R.S., as electrical engineer to the corporation, (1) the professor to submit a comprehensive scheme for the lighting of the city, with estimates of costs, annual expenses, and probable income, for a fee of 100 guineas and out-of-pocket expenses; and (2) the professor to accept the appointment of engineer to the corporation electric lighting undertaking, and to prepare detailed plans and specifications, and to supervise the execution of the work, for a commission of 5 per cent., and the fee of 100 guineas to merge in the same commission.

The markets committee of the Leeds Corporation paid a visit to the Kirkgate Market on Monday, and decided upon a scheme for the partial reconstruction of those premises. Instructions were given to the city engineer (Mr. T. Hewson) to prepare plans for a new frontage to Vicar-lane and Kirkgate, for the covering in of the present blocks of fruit and provision buildings, and for the construction of a road from Vicar-lane through the present covered portion to the lower end of the market.

The foundation-stone of a new Roman Catholic church, Park-road, Peterborough, was laid on Tuesday week by the Bishop of Northampton. The complete church of which the first section is now in hand, will consist of nave, north and south aisles, north and south transepts, chancel, and north and south porches, &c. The church will be built of Stamford stone in the Decorated style. Apart from land, the portion at present being erected will cost about £4,000. At the west end a presbytery is being built. It, too, is of stone, and runs at right angles to the church, which it joins. Mr. Leonard Stokes, of London, is the architect, and Mr. Hammond, of Peterborough, is the builder.

A four-manual organ, built by Messrs. Wordsworth and Co., has been placed in the parish church of Epping. It is said to be the largest instrument in an Essex church.

Intercommunication.

QUESTIONS.

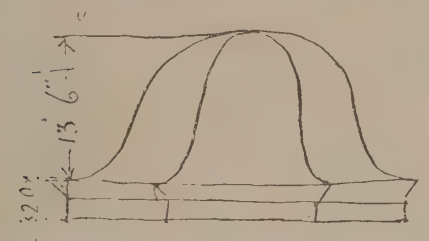
[11459.]—**"Building News."**—I should be glad if anyone would inform me if there are any portfolios made for a volume (half-year), the price, and where I can get them? It seems to me it will be better and cheaper than having them bound up in the usual way. Should be pleased to have any suggestions.—Student.

[11460.]—**Dormitories.**—What amount of cubical air-space should be allowed in planning dormitories for children and for adults? Does the Education Department make any definite regulation upon this point in schools over which they have control?—C. H. Channon.

[11461.]—**Whitewash.**—What is the best method of cleaning an accumulation of successive coats of whitewash from old carved stonework without injury to the surface and tooling?—Doubtful.

[11462.]—**Hot-Water Heating.**—Will some reader kindly give me name of a good inexpensive book which fully explains heating by hot water, and what size and amount of pipes, &c., are required to heat given areas?—Student.

[11463.]—**Wind-Pressure.**—Will any reader kindly give me the method of measuring wind-pressure on an ogee roof thus: octagonal on plan, and 30ft. diameter?—Architect.



REPLIES.

[11454.]—**Skittle Alley.**—The room should be about 40ft. long and 18ft. wide; the table (about 5ft. 3in. square, set diagonally 2ft. from the end) should be of 2in. oak, bedded in clay and concrete 2ft. thick. The channel from the first skittle should be 21ft., and 2ft. 9in. wide, 2½in. below floor with curb. The well next player should be 4in. deep, and the space for player from well to wall 10ft.; remainder of room boarded or cemented.—H. Lovegrove.

CHIPS.

The Town Council of Bodmin have decided to invite competitive designs for the Passmore Edwards Free Library to be built in that town.

The managers of the British schools at Truro have instructed Mr. Silvanus Trevail, M.S.A., of that city, to prepare plans for two schools to accommodate 450 children, and to cost about £2,500.

The Château d'Amboise, bought by the Duc d'Aumale at the sale of the property which formerly belonged to the Comte de Paris, is to be transformed into an asylum for the old servants of the Orleans family.

The directors of the London, Brighton, and South Coast Railway Company have appointed Mr. Charles L. Morgan, assistant engineer of the Great Eastern Railway, to be chief resident engineer of this company, in succession to Mr. Frederick Dale Banister, who retires on the 1st of February next.

The premises of Messrs. M'Gaws and Co., woodmoulders, 77, 79, and 81, York-road, Lambeth, were destroyed by fire on Friday night. The workshops of two floors, covering 60ft. by 30ft., were burnt out, a block of timber stores 30ft. square was destroyed, and other buildings were greatly damaged by fire.

The Leeds Corporation have instructed the city engineer (Mr. Thomas Hewson) to get out tenders as early as possible for the erection of five new blocks of hospital buildings upon the Manston estate. These will include premises for the treatment of smallpox, scarlet fever, and typhoid fever patients, a small sanatorium, a disinfectant station, and a caretaker's house. This is but part of a scheme, for carrying out which the Leeds Corporation have asked the sanction of the Local Government Board to borrow £63,000.

The reopening of St. Anne's Roman Catholic Cathedral in Leeds took place on Sunday. The interior has undergone at the hands of painters and decorators a complete transformation from its dingy hue to a lightness of tone, while the sanctuary has been ornamented, the panelling gilded and chased, and the walls adorned with representations of the implements of the Passion, after an ancient marble monument at Ravenna. The work has been done under the direction of Mr. J. F. Bentley, of London. The painting has been executed by Mr. N. Hitch, of London. The installation of the electric light, which has just been completed, was carried out by Mr. Edmondson, of Kirkstall-road, Leeds. The expenditure on the decoration and lighting amounts to £700.

Legal.

REGISTERED DESIGNS.

Under the present law a "new or original design not previously published in the United Kingdom" can be registered, and so protected against infringement. This is, of course, a very important matter, for there are many things for which a valid patent could not be obtained, but which, nevertheless, might be made copyright by registration under the Act, and so secured from legal imitation at all events. In a recent case between rival lamp-makers (*Times*, 20 Nov.), which went to the Court of Appeal, the article in question was an oil-stove. The plaintiffs were the proprietors of a registered design for an oil-stove which they sell as the Cathedral stove. This design simply consists of a traceried window applied to the sides of an hexagonal case of metal in which is placed an oil-lamp for heating purposes. The defendants also sold oil-stoves of the same shape, with a church window similarly applied. The plaintiff's design was registered in accordance with the Patents, Designs, and Trade Marks Act, 1883, and the action was brought for an injunction and damages for the infringement.

At the trial Mr. Justice Kekewich held that there had been no infringement, and so he dismissed the action. Upon plaintiff's appeal this decision was reversed, and an injunction and an inquiry as to damages were granted. The Lord Chancellor pointed out that the eye was the true test in all these cases, and that the question of infringement be decided by placing the designs side by side, and asking whether they are the same, or whether the one is an obvious imitation of the other. But to this simple rule he added that, as a design to be registered must be "new or original," it was necessary to take into account the state of knowledge at the time of the registration, and in what respects the design was new or original when considering whether any variations that appear in the alleged infringement were substantial or immaterial. It seems probable that this protection by registration of designs might be more often enforced by action than is done if proof of infringement is so easy, and the design can be so readily shown to be "new or original," as appear to have occurred in this case.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Perplexed.—Partnership.—Premium.—The value of a share in a partnership depends upon so many conditions, that it is quite impossible to lay down any rule. For a new business, about two years' purchase would probably be reasonable.

Doric.—Additions.—Building-Line.—The question seems to come to this: Which is the building-line? If the new houses are taken, you would be right; if the old frontages are followed, these would be wrong. It seems to me that the Council are acting unreasonably, and probably the Court would interfere.

H. H.—Contract.—Defects.—Foundation.—If you can prove that the defect was in the made ground upon which you built, and not in your work or materials, you would not legally be liable.

J. C.—Contract.—Extras.—Architect.—By the clause quoted, these extras would be claimable, I should say, provided you obtain the architect's certificate as to their value, in accordance with the contract.

Mr. G. W. Willocks, M.I.C.E., held an inquiry at Wakefield, on Friday, as to an application to the Local Government Board by the City Council for permission to borrow £25,000 for providing electric lighting. There was not the slightest opposition. Mr. Robert Hammond, electrical engineer, London, has been consulted by the City Council, and is to superintend the erection of the intended works. The site of the proposed works is Calder Vale, and they are to be carried on in connection or combination with the proposed sewage works. The estimated cost of the plant is £15,280.

On Wednesday evening last the managers of subcontractors and all the foremen engaged on the new building (about 40 in all) were entertained at dinner by the Council of the Institution of Civil Engineers at the Ship Hotel, Charing Cross, on the occasion of the commencement of the session 1895-96. A capital musical programme was provided, in which Messrs. Court, Cook, Clark, Tyler, and West took part. Owing to the unavoidable absence of Mr. Charles Barry (the architect), the chair was taken by Mr. R. Stephen Ayling, with Mr. H. Hadfield, clerk of works, in the vice-chair.

LEGAL INTELLIGENCE.

A Redhill Arbitration Case.—At the Surveyors' Institution, Great George-street, Westminster, Mr. Henry Currey, F.S.A., F.R.I.B.A., has sat as arbitrator in the claim for £19,900 for compensation which had been made by Mr. G. B. Rennie, C.C., from the London, Brighton, and South Coast Railway Company, who have obtained Parliamentary powers to purchase, among other properties, the Hooley Estate, near Redhill, for the purpose of constructing their new line between Croydon and Redhill. The estate comprises 14½ acres. The claimant purchased the property in 1874 and 1885 for £8,600, and had since spent considerable sums on improvements, including an additional £830 for further land. Mr. Robert Vigers, F.S.I., said land in the neighbourhood of Redhill was in great demand for building purposes. He valued the property at £19,500. It would fetch £600 a year at 20 years' purchase. Mr. E. Tewson, F.S.I. (Messrs. Debenham, Tewson, Farmer, and Bridgewater), 80, Cheapside, E.C., placed the cost of reinstatement at £19,000. Mr. F. T. Galsworthy, F.S.I. (Messrs. Chinnock, Galsworthy, and Chinnock, 11, Waterloo-place, S.W.), believed the price should be £15,635. Quite recently he had sold land at Redhill at the rate of £800 an acre. Mr. A. Garrard, F.S.I. (Messrs. V. Buckland and Garrard, 8, Frederick's-place, Old Jewry, E.C.), valued the property at £16,903; but these figures did not include the fixtures of the house, the sand which was being removed, or the land which would be left after its removal. Sir John Whittaker Ellis, Bart., F.S.I. (Messrs. Farebrother, Ellis, Clark, and Co., 29, Fleet-street, E.C.), called on behalf of the company, gave as his opinion that the property would not fetch more than £4,000 or £5,000, owing to its peculiar position. His valuation totalled £8,220. His figures were based upon 20 years' rateable value. Mr. Daniel Watney, 33, Poultry, E.C., believed that if the Hooley Estate was put in the market it would not fetch £6,000. Mr. Bousfield (Messrs. E. Fox and Bousfield, 99, Gresham-street), placed the full market value of the property at £7,500 in round figures. Mr. Moon (Messrs. Fuller, Moon, and Fuller, of Croydon, Guildford, and Epsom) valued the estate at £6,930. The decision of the arbitrator will be made public in due course.

Breach of Electric-Lighting Agreement.—In the Queen's Bench Division, on Friday, before the Lord Chief Justice and a special jury, the hearing was concluded of an action brought by the Fareham Electric Light Company, Limited, against the Fareham Urban District Council to recover damages for an alleged breach of an agreement whereby the defendants undertook to buy from the plaintiffs their electric-lighting installation at Fareham, at a price to be fixed by arbitrators, and which was subsequently fixed at £4,866 3s. The defendant board had declined to carry out the agreement, and during the hearing of the case it was stated that this was due to a change in the composition of the board, by which a majority was returned in favour of gas-lighting instead of electricity. The jury found for the plaintiffs, with £3,800 damages, and judgment was entered accordingly, execution being stayed till Jan. 15.

In re G. H. Ilett, Warsop.—The first meeting of the creditors of George Henry Ilett, builder, of Warsop, near Mansfield, was held on Nov. 27 at Nottingham. The statement of affairs showed gross liabilities £171 1s., all of which was expected to rank for dividend. His assets debtor estimated at £33 18s., leaving a deficiency of £137 3s. He only commenced business in May last, his capital being £50.

Curious Sequel to a Joiners' Strike.—The hearing of the action brought against Mr. Græme Hunter by the Chorley Master Joiners' Association for breach of contract was concluded at the Chorley County Court on Friday. Mr. Hunter entered into a contract in June last to supply the master joiners with thirty men to take the places of men who were on strike. The sum of £30 was paid to him for that purpose, but he failed to carry out his contract, which was ultimately rescinded by the Masters' Committee, damages being claimed. After hearing witnesses, his Honour Judge Coventry withdrew any imputation of bad faith against Mr. Hunter, which there had seemed grounds for making at the previous hearing. It appeared rather, he said, to have been Mr. Hunter's misfortune that through pressure of work he was unable to carry out his contract. A verdict by agreement was taken, the defendant to pay £20 and costs on the higher scale.

Railway Arbitration at Leicester.—Mr. Thomas Fenwick, C.E., sitting as umpire in the arbitration inquiry of "Gouty v. the Manchester, Sheffield, and Lincolnshire Railway Company," at the Surveyors' Institution, gave an important decision on Wednesday. The claimants, a firm of dyers in Leicester—sought to obtain from the railway company the value of the whole of their works, submitting that the company could not take a portion of the property without material injury to the whole, they having scheduled the property as excluded from the benefit of section 92 of the Lands Clauses Act. Mr. Littler, Q C., for the company, contended that the claimants should accept a new entrance to their works under one of the railway arches, but this contention was resisted by Mr. Bidder, Q C., for the claimants, and cases were cited to show that the company had an indefeasible right to the occupation of the arches for all time and under all conditions. The company relied upon the practice of letting their arches all over the country, but it was pointed out that serious injury had been done to some railways by fires which had taken place in these arches, and that in some cases companies had actually gone to Parliament for power to retake arches which they had let under conditions similar to those now proposed. The umpire, after a two days' hearing of this preliminary point, gave, on Wednesday, the following decision:—"First, if the land taken by the company under their notice to treat prevents all access to claimants' works through or under the viaduct, the company must purchase the entire property; second, if the company have power to give the access offered by their counsel through the archway which has been constructed from the street to the claimants' yard, I hold that there is not such material detriment to the property as to entitle the claimants to claim that the company must purchase the whole; third, believing that there is nothing to prevent the roadway offered by the company from being accepted by the claimants as a means of access, I propose to hear the parties on that basis as to the compensation to be paid by the company for the land they take and for the damage sustained by the claimants in consequence thereof." A case will be stated for the hearing and settlement of the legal questions involved, but meanwhile the arbitration proceeds, in order to find the amount of compensation to be given in view of alternative legal decisions.

Defective Drains.—Mr. F. Funkenstein, builder, of Upper North-street, Poplar, was recently summoned at the Thames Police-court for causing a water-closet and drain to be so repaired as to become a nuisance and dangerous to health. James S. Dunn, sanitary inspector to the Poplar Board of Works, said on the 12th September he inspected 54 and 56, Arcadia-street, and found the drains defective. On the 30th September he again went to the premises, and found the drains defective. On the 30th October the drain had been covered in. He tested it, and found it defective. At both houses the joint between the closet trap and the pipe was defective. The repairs still left the drain a nuisance and injurious to health. Mr. O. C. Hills, architect, said on Tuesday last he saw the ground opened. A new trap, pan, and pipe had been put in, but there was a defect where the old and new pipes joined. Cross-examined: He advertised for tenders for the work, and the defendant's tender was accepted. He tendered upon a specification which was furnished him by the witness. The only defect, so far as the specification went, was in the fixing. Dr. Alexander, medical health officer, corroborated Mr. Dunn's evidence. The defendant's answer to the summons was that he came within the saving clause of the section—viz., that he had so repaired the water-closets as not to render himself liable. Mr. Dickinson, at an adjourned hearing of the case, fined defendant, for No. 54, £7 and six guineas costs, and for No. 56, where defendant seemed to have taken steps to remedy the defective workmanship, £1 and 2s. costs.

* * *

The burgh commissioners of Dumfries have decided to construct a new main sewer, which shall intercept the whole drainage of the town and discharge it into the Nith at a point a little below Kingholm Cottage. The commissioners of the burgh of Maxwelltown contemplate at the same time carrying out a main drain down the opposite side of the river to near the same point. The estimated cost of the Dumfries scheme is £5,074.

Mr. H. Tulloch, M.I.C.E., held, at the instance of the Local Government Board, an inquiry at Middlesbrough, on Friday, into an application from the Tees Port Sanitary Authority for sanction to borrow £1,000 for the completion of a retaining wall for the protection of Tees Floating Hospital. Mr. Tulloch also held another inquiry into the proposed loan of £100,000 for the erection of an asylum to make provision for the pauper lunatics from the Middlesbrough Union. The asylum is now in course of erection at Grove Hill.

A crematorium and chapel, in the Western Necropolis of Glasgow, near Maryhill, were opened on Friday. The building is on two levels, the chapel on the higher and the incinerating chamber and attendants' room on the lower. Cruciform in shape, the chapel has a front elevation of 14ft. by 36ft. high, with buttressed doorway surmounted by three lancet windows. The catafalque occupies a central position in the chapel. The total cost of the crematorium and chapel and their equipment has been about £3,000.

WATER SUPPLY AND SANITARY MATTERS.

Halifax.—Mr. Arnold Taylor, formerly an inspector to the Local Government Board, visited Halifax a few weeks ago, at the request of the corporation, with the view of expressing an opinion upon a system for the treatment of the sewage of the town. In his report, he advises the corporation not to put any company or patentee in possession of their sewage outfall works. With regard to the system of the "Oxygen Sewage Purification Company," Mr. Taylor is of opinion, after seeing it in operation at Salterhebble on the 11th of October, that it will not purify the sewage of the borough as to comply with the provisions of the Rivers Pollution Prevention Acts.

CHIPS.

A building to be known as the Union Chambers is being erected at Aberdeen, on the site so long occupied by the Song School, from designs by Messrs. William Henderson and Son. The alterations and additions will cost about £6,000, and the purchase-money paid for the old premises amounted to another £12,000.

At the meeting of the British Archæological Association, held on Wednesday night, the Rev. J. Cave Browne, M.A., read a paper on "Purbeck and its Marbles."

At the last meeting of the City Council of Exeter, Councillor Linscott said it was his very painful duty to report that the Bucknill Memorial, on Northernhay, which the council took over last July from the subscribers, was in a very dangerous state. The base was evidently not supported on a sufficient foundation, and, in sinking, the memorial had broken the corner of one of the granite slabs. The matter was referred to the city surveyor and town clerk to investigate and report upon it.

The city council of Liverpool accepted, on Wednesday, a donation by Mr. John Duncan, on behalf of the executors under his father's will, of a copy in marble of the Warwick Vase and a marble bust of Canning by William Spence.

The Manchester, Sheffield, and Lincolnshire Railway Company have decided to carry out certain dock extensions at Grimsby, with a view to increase the accommodation for the fishing industry. The proposed works are estimated to involve an expenditure of £150,000.

The Boston Town Council, sitting as the Harbour Trust, on Monday decided to deepen the river from the dock to the sea—a distance of 3½ miles—to a uniform depth of 2ft. below the dock sill, with a minimum width of 80ft. It is estimated that the cost will be £5,000. Fifteen months are allowed in which to execute the work.

The Archbishop of York reopened on Tuesday, after restoration, the parish church of All Saints, Barlby, near Selby, and during the service dedicated the new chancel, which was part of the work of restoration.

The orphanage and imbecile asylum at Baldovan, N.B., is about to be enlarged under the direction of Mr. Alexander Hutcheson. The chief contractors are Messrs. Robertson and Macpherson for masonry, and Mr. Alexander Young, of Lochee, for joinery.

On Thursday in last week a new church was consecrated in the parish of Christ Church, Woking, by the Bishop of Winchester. The building is dedicated to St. Paul, and will take the place of an iron room where services have hitherto been held. The church was designed by Mr. Purday, partner of the late Mr. Ewan Christian, and is built of red brick, to accommodate about 300 worshippers at present; but at some future date aisles will be thrown out. The church, including site and furniture, has cost about £3,120.

The pavilion on the Warwickshire County Cricket Ground is being enlarged at a cost of £1,500. Mr. Baker, of Broad-street Corner, Birmingham, is the architect, and Mr. Bishop, of King's Heath, is the builder.

In the Chancery Division, on Tuesday, before Mr. Justice Stirling, an application was made by the plaintiff in the case of "Graydon v. Bassett" to restrain the defendant from constructing a gigantic wheel at Blackpool, on the ground of alleged infringement of the plaintiff's patent at Earl's Court. The defendant submitted that his wheel was a scheme of his own, and that there was no interference with the plaintiff's patent. The motion stood over for a week, with a view to an arrangement if possible.

The Vice-Chairman of the London School Board opened, on Friday, the new buildings recently erected in connection with the Yerbury-road Board School, Upper Holloway. He said that the school had been enlarged at a cost of £5,280. By the extension accommodation had been provided for 1,590 children. The new portion of the school included a laundry and a manual training school.

Our Office Table.

The negotiations between the Carpenters' and other City Companies and the Architectural Association have been satisfactorily completed, Professor Banister Fletcher having represented the Companies, and Messrs. F. T. W. Goldsmith and Owen Fleming the Association. The result is that the Trades Technical Schools in Great Titchfield-street are definitely opened to students of the Association, who are admitted by the Carpenters' Company on the same terms as craftsmen actually working at their trades. Instruction is given in carpentry, joinery, masonry, brickwork, lead-work, plaster-work, and wood-carving, and a smith's forge is about to be opened. The instructors are craftsmen who have skill in their various crafts. In future, any authorised member of the Association will be able, at an expense of a few shillings a term, to obtain an actual knowledge of materials in a way that has been hitherto closed to him. There will be no expense for materials and tools, these being found by the Company.

During the past five years the Gresham Committee have had in view a scheme for decorating the panels around the ambulatory of the Royal Exchange. Mr. Deputy Snowden inaugurated the movement in 1890 by offering to fill in the first panel at his own expense, and Sir Frederic Leighton, P.R.A., simultaneously promised to paint and present another. These gifts were accepted by the committee, who called in Sir Frederic Leighton, Mr. Calderon, R.A., and Mr. Poynter, R.A., to assist them in arranging a plan for filling in the remaining 22 panels, and in selecting the artists and the subjects of the frescoes. The two first panels, at the west end of the Exchange, were unveiled last June—the one painted by Mr. Macbeth, A.R.A., and depicting the opening of the Royal Exchange by the Queen in 1844, and the other by the President of the Royal Academy, entitled "The Phœnicians trading with the Britons." The corporation, acting through the Gresham Committee, have now commissioned Mr. Seymour Lucas, A.R.A., to fill in a panel with a representation of "William the Conqueror Granting a Charter to the Citizens." Mr. Carl Meyer, of New-court, has promised a panel representing "The Offer of the Crown to King Richard III. in Baynard's Castle," to be painted by Mr. Sigismund Goetze; and Sir Samuel Montagu, M.P., has offered a panel portraying "Charles I. Demanding the Five Members at Guildhall," by Mr. Solomon J. Solomon. The Mercers' Company will contribute a panel representing "The Opening of the Royal Exchange by Queen Elizabeth"; but they have not yet selected the artist. The subjects of the remaining 18 panels have also been selected by the committee and their art advisers.

At the adjourned inquiry into the proposed demolition of the Trinity Almshouses in Mile End-road, held before Mr. G. S. Murray on behalf of the Charity Commissioners at the close of last week, Mr. Jarvis, the surveyor, stated that the almshouses were badly planned, and that the basements were very damp; he did not consider the houses were fit for occupation. In answer to Mr. Hopkinson, he said he had never mentioned these points before in any of his reports. The Right Hon. G. J. Shaw Lefevre, M.P., Mr. J. MacVicar Anderson, F.R.I.B.A., and Mr. F. C. Penrose, P.R.I.B.A., gave evidence against the demolition, the latter witness remarking that the buildings were a unique example of Sir Christopher Wren's period, and were, in all probability, the work of that famous architect. They were also of great value to students as a chaste model. Mr. C. R. Ashbee championed this view of the case, and was supported by Mr. Spencer Charrington, M.P., and Mr. Kerwin. Mr. Armstrong, solicitor to the Trinity Corporation, said that of late the almshouses had been found to be a white elephant, and a hindrance to the extension of their charities. He suggested that the buildings should not be pulled down, but purchased for the purposes of a school of architecture. The case as regarded the Mile End almshouses then closed.

The vestry of Camberwell have unanimously adopted a report by a committee, consisting of Lady Burne-Jones, Mr. T. Wyke-Bayliss, and Mr. Paxton, recommending that the commissioners of public libraries and museums for Camberwell undertake the management and maintenance of the South London Fine Art Gallery in Peckham-road. This institution has hitherto been maintained at a cost of £600 a year by voluntary contributions. The principal room, it will be remembered, was erected from the designs of Messrs. Ernest George and Peto at the sole cost of Mr. J. Passmore Edwards, and was opened by the Prince of Wales Oct. 9th, 1893, in which week illustrations were given in our pages.

THE Commissioners appointed by the Board of Trade to inquire into the condition of the navigation of the Lower Thames resumed on Tuesday their sittings, which were adjourned in January last to admit of a complete survey being made of the area of the river from the Nore to the East and West India Docks. Mr. J. Wolfe Barry, C.B., the chairman, stated that the survey had been executed partly at the instance of the Admiralty by Commander Pirie, and partly on the instruction of the Commissioners and the Lower Thames Conservancy by Captain Jarrad, and that the navigation channels had been found to be considerably better than they were supposed to be according to the chart of 1883. Captain Jarrad gave evidence confirmatory of this statement, and said that the shoals were all diminishing, the depth of the navigable channels increasing, and, owing to the action of the ebb tide, there was a tendency in the channel still further to improve. After some further evidence had been given the chairman announced that the commission did not propose to sit further in public at present, or to enter into the financial part of the subject. They had first to make up their minds whether they were going to recommend any works, and, if so, what works. The inquiry was then adjourned *sine die*.

MR. G. W. WEBB, F.R.I.B.A., the chairman of the Survey Committee of the Corporation of Reading, has made an interesting find of plate belonging to the Corporation, which had been lost sight of for several generations. While searching the basements of the Municipal buildings his curiosity was aroused by the sight of a wooden chest with iron mountings in one of the recesses of the vaults. Mr. Webb opened the chest, and found therein some pewter circular plates and dishes, black with age. There are three sizes, the largest being 2ft. in diameter, and the others (dinner plates) in two sizes. On the large dishes the Borough arms are cut on the front, and on some of the others the words "Corporation of Reading" run round nearly half the edges, and on others the Borough arms are stamped. The plate-marks on the back are exceedingly good, the maker's name, "Ebly," and "made in London," being quite clear. The stamps also include a stag (part of the crest of Berkshire), the rose and crown, Britannia and the lion (the latter being not unlike the silver stamp). There are altogether three or four dozen plates, all very thick and heavy, and their probable date is 1710. About nine dozen quaint pewter spoons were also found, with "C of R" ("Corporation of Reading") on them, and 19½ dozen old Sheffield plate large spoons, inscribed with the Borough arms. The plates and spoons most probably figured at municipal banquets in the last century, but certainly have not been used by the Corporation for 70 years. The chest was stowed away when the Corporation offices were removed from Watlington-street to Blagrave-street.

LORD KELVIN, Mr. W. H. Preece, and Major Cardew, the committee of experts appointed by the Board of Trade, have presented their report on the questions referred to them as a result of the recent conference on the proposed new electric lighting regulations, presided over by Sir Courtenay Boyle, the Permanent Secretary of the Department. The principal matter on which the committee were asked to advise was as to the definition which should be officially laid down to constitute "low pressure." As presented to the conference, the revised regulation of the Board of Trade proposed that a pressure which could not at any time exceed 300 volts, if continuous, or the equivalent of 150 volts, if alternating, should be deemed a low-pressure supply; but the Institution of Electrical Engineers urged that 600 volts should be accepted as the low-pressure limit. Dr. Hopkinson stated that, with the five-wire system, electricity was already being supplied in Manchester at a low pressure of 400 and 450 volts, without any serious consequence. The Electrical Committee of the London Chamber of Commerce advised that the low-pressure limit should be raised to 500 volts, and other experts considered that in view of the advance made in electrical science, it was no longer necessary to draw any distinction between alternating and continuous currents.

THE chief feature of the winter exhibition of pictures at the Corporation Art Gallery, Bradford, opened on Monday, is a series of eighty-five works in oil and water colours by Byron Cooper, illustrating "Tennyson Land," including landscapes in Lincolnshire, the western corner of the Isle of Wight, Surrey, and north Cornwall. Other landscapes are contributed by J. Buxton Knight and Anderson Hague, seascapes by C. Napier Hemy, and examples of *genre* by W. A. Howgate, of Leeds.

◆

The Admiralty have appointed Mr. Whateley Eliot, who was recently engaged on the construction of the Manchester Ship Canal, to be superintending civil engineer for the important dock extension scheme at Devonport provided for in the Naval Works Act. A large body of workmen has been engaged for several months in making preparations for the actual operations, which will be commenced shortly. The scheme, which will cost over £2,000,000, will occupy about ten years. The Admiralty intend to provide three additional large docks, besides one of smaller size, and two great basins, the whole covering an area of nearly 44 acres.

At the opening meeting of the session of the Edinburgh and East of Scotland Branch of the National Association for the Registration of Plumbers, held on Friday night in the Philosophical Institution, Edinburgh, Provost Shanks, Barrhead, lectured on "Modern Sanitary Appliances." Sir Henry Littlejohn presided. The lecturer dealt in detail with some of the later developments of sanitary science affecting private houses and public institutions. Bath-rooms should not be the dark, cold dungeons they were in many houses in Glasgow and Edinburgh, but should be well-lighted and comfortable apartments. He hoped the time was not far distant when landlords would have to provide, even in workmen's houses, suitable places for washing.

Messrs. A. Waterhouse and Son, FF.R.I.B.A., London, the architects of the new buildings for the Prudential Assurance Company in St. Andrew-square, Edinburgh, and Albert-square, Dundee, have placed the contracts for the fireproof construction (under Mr. Boyd Wilson's patent), including the whole of the structural steel and iron work of the buildings, with Messrs. Arrol's Bridge and Roof Company, Limited, Germiston Works, Glasgow.

Mr. Christopher Oakley, the arbitrator appointed by the Board of Trade, resumed in London, on Friday, the consideration of the claim made against the Manchester Corporation by the trustees of the late Peter Todd, for the loss of water from their estate at Wheelton, through the construction of the Thirlmere aqueduct. Mr. Boyd Dawkins, professor of geology, and an expert in questions of underground water, was further examined on behalf of the corporation as to the geological formation of the strata through which the aqueduct passes.

The plans for the new asylum for Lancashire, at Winwick, prepared by Messrs. Crisp and Oatley and Mr. H. S. Skinner, of Bristol, whose design was selected in competition in July, 1894, have now been approved by the Lunacy Commissioners. A Local Government Board inquiry will be held shortly into an application by the Lancashire County Council to borrow £250,000 for the buildings.

William Thomas Singleton, described as an architect and surveyor, and James Frederick Livesay, a baker, were, at Liverpool Assizes on Monday, charged with having conspired together to defraud a number of Liverpool solicitors by obtaining money under false pretences. The *modus operandi* of the prisoners was of a simple character, and the same in each case. They called on the solicitors, represented that they had purchased properties near Manchester or Stalybridge, produced spurious documents to bear out their story, and, engaging the solicitors to act for them in the transactions, obtained advances ranging from £15 to £60. The jury found both prisoners guilty, and Mr. Justice Collins sentenced them each to twelve months' imprisonment with hard labour.

At the recent election in the State of New York the people voted in favour of the proposition to expend nine millions of dollars towards the improvement of the Erie and other canals. This canal connects the waters of the great lakes with the Hudson River at Albany, and so on to the Atlantic Ocean.

Mr. George Barstow, of Pontefract, a practical builder, and formerly for many years a member of the corporation, died suddenly on Friday. Mr. Barstow was seized with an apoplectic fit in the Market-place, and was carried into the Conservative Club, and died in a few minutes.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. "The Working of the Agricultural Holdings Act, 1883," by F. Punchard, F.S.I. 8 p.m.

Society of Engineers. Annual Meeting. 7 30 p m.

Liverpool Architectural Society. "Some Thoughts on Old Furniture," by Guy Dawber, A.R.I.B.A.

TUESDAY.—Institution of Civil Engineers. Discussion on "The Physical Properties of Iron and Steel." 8 p.m.

Sheffield Society of Architects and Surveyors. "Norman Architecture," by Dr. H. C. Sorby, F.R.S.

WEDNESDAY.—Society of Arts. "Water Purification by Means of Iron," by F. A. Anderson. 8 p m.

Northern Architectural Association. "Adam, and his Style of Architecture," by Percy Fitzgerald, M.A., F.S.A., of London. 7.30 p.m.

◆

CHIPS.

At the parish church of Hatfield Broad Oak, a stained-glass window has been erected in memory of Sir William Wiseman, ninth baronet. It is of three lights, and the subject is Christ stilling the tempest. Messrs. Hardman, of Birmingham, carried out the work.

The construction of the southern extension of the Liverpool Overhead Railway is proceeding at a satisfactory pace. Two-thirds of the entire length are all but completed, and the extension will be opened within a period of six months. The terminus is in Park-road.

Works of street improvement are being carried out for the urban district council of Scunthorpe, at a cost of £1,300. Mr. Robertson is the surveyor, and the material has been supplied by the Croft Granite Company.

Mr. Edwin Farber, surveyor and architect, of Hightown, Crewe, died on Wednesday week. He was for many years a prominent member of the Crewe Alexandra Cricket Club, holding the position of treasurer down to the time of his death.

Tenders are being invited for boring a tunnel about 800 yards long, 8ft. high, 7ft. wide, through slate rock from Delabole Slate Quarries to the seashore, so as to unwater the quarries and make them profitable.

The new goods station erected by the North-Eastern Railway Company in Prior-street, Gateshead, was informally opened on Monday. The cost of the station, including the land, has been about £50,000. The contractors were Messrs. Blackett, of Bishop Auckland.

A new altar and super-altar, of oak, with grey Cornish granite slate, have been placed in Mawnan Church, Cornwall. Both have been executed by Messrs. Harry Hems and Sons, of Exeter.

Mr. Arthur Grimwood, of the firm of Grimwood and Sons, builders, Sudbury, was recently elected town councillor of the borough, and a few days later was made an alderman. To celebrate the double event, he invited the workmen and many friends, to the number of 400, to a public dinner at the Drill Hall on Tuesday evening in last week, and on the following day Ald. Grimwood entertained 300 ladies at tea in the same hall.

A scheme of water supply for St. Austell has just been carried out for the urban district council of that town. The work has been undertaken from plans by Mr. J. Samble, surveyor to the council, and the water is obtained from Carne Stent. The reservoir is placed at Trenance, and has a capacity of 800,000 gallons. It was built by Messrs. Delbridge and Son, of Camborne, and the pipes have been laid by Messrs. R Francis and Son. The total outlay has been £5,200.

The London local authorities are being urged by the Amalgamated Society of House Decorators and Painters to give out as much painting work as possible during the winter months.

Mr. John Thorman, engineer to the West Ham Gas Company, died on Thursday in last week, after a few hours' illness, aged 48 years.

The parish church of St. John, Chadderton, near Manchester, is about to be reseated in pitch-pine, when the present lights will be replaced with new windows of cathedral glass, and the organ and heating apparatus will be enlarged.

The works at Truro Railway Station, for which Mr. Arthur Carkeek, of Redruth, has secured the contract, include the erection of the first three arches of the granite bridge which is to span St. George's-road in the place of the present wooden viaduct, and also alterations and additions to the goods shed, the cattle pens, and the horse and carriage landings. In the station itself, the up-platform will be widened, and new refreshment and waiting rooms will be erected thereon. The present roof will be removed, and the remodelled station will be covered over the buildings and platforms only.

Trade News.

WAGES MOVEMENTS.

North Wales Slate Quarries.—Lord Penrhyn's agent, Mr. E. A. Young, announced on Monday to the men employed at the Penrhyn Slate Quarries that their wages would be advanced 5 per cent. on and after the 24th of December. The advance affects about 3,000 men and boys, and is promised to all classes alike.

CHIPS.

The dedication of the new east window in the parish church of Ashbourn took place on Wednesday week. The window is Perpendicular in style, and has been designed by Mr. C. E. Kempe.

At a cost of upwards of £5,500, new malting-cellars are about to be constructed for Russell's brewery at Gravesend, according to the designs of Messrs. Arthur Kinder and Son, architects and engineers, Suffolk House, Laurence Pountney-hill, Cannon-street.

A reredos of Caen stone and marble has just been erected in the church of St. Mary, Shotesham, near Norwich. The structure is in the Late Decorated style, the central portion being carved in high relief with a representation of the Last Supper, after the style of Leonardo-da-Vinci. A canopy of pierced tracery and carved pinnacles rises above this, and the side wings form a series of panels with surface tracery in the same style. The work has been executed by Messrs. Jones and Willis, of Birmingham, London, and Liverpool.

The extensive additions to the county asylum, Prestwich, near Manchester, are being warmed and ventilated throughout by means of Shorland's patent open fireplace Manchester stoves, the large number previously supplied having proved very satisfactory.

The contract for the new technical and art schools at Leicester, which are to be built from the design of Messrs. Everard and Peck, has been let to Messrs. T. and H. Herbert, builders, of Leicester. The ground and first floors and all the corridors are to be fireproof on the "Mark Fawcett" system.

On Friday, Mr. W. J. B. Clerke, M.I.C.E., held an inquiry at Tunbridge Wells, on behalf of the Local Government Board, into proposed loans by the Corporation of £23,200 for the purchase of lands for the purpose of municipal buildings, technical institute, public library, museum, and street improvements; and £7,200 for the erection of public baths. No opposition was offered to the proposals.

The parish church of St. Hilda, Hinderwell, is being restored, at a cost of over £1,000, from plans by Mr. R. Lofthouse, the diocesan surveyor. The works include reseating, new roof, floor, and windows.

The statement of affairs of Messrs. Guy and Gosseman, builders, of Grimsby, shows liabilities £4,982 11s. 9d., and assets £1,750 2s. 6d., leaving a deficiency of £3,232 9s. 3d. The Official Receiver states that Guy offered 7s. 6d. in the pound on the joint estate; but Gosseman would not agree to this.

M. Alexandre Dumas has bequeathed his portrait by Meissonier to the Louvre.

The return at the Estate Market, Tokenhouse-yard, for 1895, will show a considerable advance on the preceding two or three years. The excellent aggregate of £127,080 was returned last week as the proceeds of the six days' sales.

Steps are being taken to invite the Prince of Wales and the Secretary of State for the Colonies to visit Toronto in August, 1897, when the British Association will meet there, to open the new municipal buildings, which by then will have been completed, at a cost of £500,000.

Red Trias —Deep Red Distemper for Outside Walls. Impervious —Randall and James, Kentish Town; 2, Crown-court, Cheapside, E.C.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.

Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

W. H. LASCELLES and Co.,
121, Bunhill Row, London, E.C.
TELEPHONE No. 270.
HIGH-CLASS JOINERY.
LASCELLES' CONCRETE.
Conservatories & Greenhouses.
WOODEN BUILDINGS.
BANK, OFFICE, & SHOP FITTINGS.
CHURCH BENCHES & PULPITS.
ESTIMATES GIVEN ON APPLICATION.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

***** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.**

Blaby.—For glass-houses, Blaby, Leicestershire. Messrs. Goddard and Co., 6, Market-street, Leicester, architects:—

Sendall and Co., Cambridge ...	£229	0	0
Tucker, D., Tottenham	199	15	0
Hardy, Bruin, and Co., Leicester*...	186	1	3

* Accepted.

Bromyard.—For alterations and additions to The Firs, Bromyard, for Mr. E. Sampson. Mr. F. R. Kempson, of Hereford and Cardiff, architect:—

Newbold, A., Bromyard (accepted).

Hot-water works:—

Mann and Son, Worcester (accepted).

VOL. LXIX.—No. 2136.

FRIDAY, DECEMBER 13, 1895.

VILLAGE BY-LAWS.

THERE are many points of view from which building matters may be considered. Amongst them are stability, safety from fire, healthiness, and relative position. How far it is wise or necessary to legislate about them was the subject dealt with by Dr. Longstaff, the chairman of the Building Act Committee of the London County Council, in his very fair and reasonable address at the Architectural Association two or three weeks ago. Dr. Longstaff is neither a builder nor an architect. His opinions are those of an educated member of the public with special knowledge of the matters he is talking about, and he seems to agree with a considerable section of our profession in thinking that building, just now, is rather over than under regulated. If this is the case even in London, where the crowding together of houses makes rules and by-laws a necessary evil, it happens much more where the population is comparatively scattered; for the one idea of suburban authorities has been to make the London Building Act a basis for their rules, and instead of relaxing them, to add in many needless ways to their severity.

Take first the case of stability. It is very rare for cottages to fall, except by gradual decay, and still rarer for anybody to be hurt when they do fall. The same thing is true of larger structures in country places. It is in our towns, where Acts and regulations abound, with district surveyors, and local surveyors, and borough surveyors to make them obeyed, that we read of buildings collapsing, and terraces falling, and people being crushed to death. In part, it is that very solidity of building which such Acts and regulations enforce, that makes these calamities possible. Acts and regulations can compel thick walls to be put up; but, as Dr. Langstaff says, they cannot, in practice, compel them to be built soundly. Now a thick wall built unsoundly is a great deal more dangerous than a thin one. The thin one, especially if it is held together by timbers, will last a long time, and weather a great many storms, even after it has bulged here and sunk there; and when it does come down, its fall is comparatively a trifle. But to pile up a thick mass of brickwork, with mortar that never sets properly, to a height of 40ft. or 50ft. is a very different thing. There is no cohesion in a wall of this sort; it has not got the timbers and wooden ties which old village walls have. It is, in reality, only so many thousand bricks set on each other with little or nothing to hold them together, and when it comes down it does come suddenly, and with terrible force.

Of course, what the framers of Acts and by-laws intend is, that the walls should be properly bonded and built with good mortar. If they were, no doubt thick walls would be both stronger and warmer than thin ones. But even then there is another side to the question. A thick overcoat is stronger and warmer than a thin one. And if it is for reasons of health and durability that thick walls are to be compulsory, it is hard to see why thick overcoats should not be so, too. No builder, under the fashionable regulations, is allowed to put up a house with less than a certain thickness of brickwork. In consistency, therefore, no tailor should be allowed to make an overcoat with less than a certain thickness of cloth. The public health is concerned in the one case as much as in the other. But even our sanitarians do not go as far as this. They see that if it were a choice between thick overcoats or none, the result, to a large part of the population, would be none. They can understand that thick cloth makes a coat dearer, but they do not realise as plainly that thick walls make a house dearer. Yet the fact is certain; and it is equally certain that dearness in building means dearness in rent. But people fail to notice this, because high rents do not force the poorer classes to do without houses altogether. They only force them to do with the smallest houses possible. If cottages might be built cheaply, the working man, and the man who does not "work," but who merely stoops over his account-books for 9 or 10 or 11 hours a day, might have rooms big enough to sit in and sleep in with safety. As it is, he and his family are crowded together in about half the space they properly require. The mania for thick walls affords him warmth, but denies him air. Then, if he or his children have any tendency to consumption, they are placed in the precise conditions to favour it; and the good sanitarian wonders, after all he has done for the public health, that consumption, unhappily, is still so prevalent.

Sanitarianism has done, and is doing, good. Unfortunately, however, it has reached the stage which most good causes arrive at sooner or later: the stage in which they give up thinking, and set up, on the strength of past performances, for being infallible. "But," the sanitarian will say, "the last thing we want to do is to keep people without air. We make a great point of ventilation, and in particular we provide in every room that a certain area of window must be capable of opening." Yes, we reply, you may provide the means of ventilation, but in what way can you compel people to use them? It is a good thing to insist on windows that can be opened, but what power have you of making tenants open them? Those who live in crowded rooms acquire a distaste for fresh air. Every surveyor who has had to prepare schedules of dilapidations in the slums knows this. Some thirty years ago, for instance, there were scores of houses near Shoreditch let out to families in single rooms. These houses were old, but originally well built: they belonged to a great City Company. Some single rooms were occupied day and night by a family of six, some by eight or nine; in one were found seven persons, old and young, and eight Maltese terriers, which they kept for sale. Every room had a sash window, and a large one; but, even in the height of summer, no window was ever found to be open, and the smell, unconquerable by tobacco and cigars, still comes across the years as nauseous as ever. Probably there are not many places so bad as that now. But where there are small rooms, and few of them, the tendency still is to shut out the air. Legislation can provide windows, but it cannot force them to be opened, and the more the tenants ought to do it the less they do. To give people room enough is the only certain way of giving them air enough.

The fact is, that London Building Acts are a very unsuitable model for village by-laws. Not only in the matter of walls, but in a great many other matters, the difference of conditions ought to produce a total difference in rules. We agree with Dr. Longstaff that meddlesome interference with building, as with other businesses, is an evil in itself. It is a thing to be kept at a *minimum:* a thing to be resorted to only in cases where we are really driven to it, as we are, to some extent, in towns. The wise course, even there—and much more in country places—is not to see how much interference the patient British public will put up with, but, on the contrary, what is the very smallest amount that will be of any use. If rules are adopted, it should be not because they have them in London or Birmingham or Manchester, but because some definite evil, going on or likely to go on in the actual village, cannot be dealt with in any other way. By-laws, to be practical, should grow up bit by bit; each bit devised for some solid reason, and meant to produce some definite working result. But this plan does not suit the theorist. He wants his set of "Model By-laws" cut and dried—invented, like foreign constitutions, by a clever man at a distance, and as certain to suit all localities as Puffaway's pills are to cure all diseases. Here the local theorist gets the warm support of the would-be local surveyor. The more by-laws there are, the more need there will be for a surveyor to see them carried out, and the better worth having his post will be. His salary will swell the rates, or his fees will make building dearer; but the accession of dignity to the village will be worth all the outlay. It will then be able to talk of "our surveyor," and will feel that it is one step nearer to a civilisation like that of Wapping, or Whitechapel, or Bethnal Green.

Suppose some increasing village—far off as yet from being turned into a town—were to startle the world by showing that it had a soul of its own. Suppose its council were to say: "Our village is not part of London, and we do not want it to be. Half of us live here just because it is not: just to get away from all the triteness and wearisomeness and formality that London Building Acts lead to. Shall we be foolish enough to bring them here after coming all this way to get rid of them? Not at all. Let us see what we can do for health and safety on lines of our own. Let us benefit the parish at large by keeping down the rates, and do all we can for the poorer householders by not running up building expenses, and, consequently, rents." What, broadly speaking, would such a council do?

One great opportunity before them would be to try what can be done for health by letting building remain cheap. Thick walls are not everything. Millions of people live and thrive without them, and even in military hospitals it has been found long since that it is better to have no walls than no air. However poor a man is, in the country he ought, at least, to have room. When freehold land is being sold at 60s. an acre, there is no excuse in the cost of village sites for cramping and crowding. Where it is done, it is too often imported by-laws that lead to the doing of it. Our self-reliant council would encourage the spending of a little more on roofs and floors, even if this meant a little less on bricks and mortar. It would not set up the cry of "Fire!" and insist on guarding against it by brick walls, unless there was some real danger. For one person who dies by fire in villages, hundreds die because rents are dear, and they cannot afford sufficient room to live in. The council would deal with the real evil, not with the imaginary one. There is a pressing need of saving people from being burned to death in seven-story houses, but not in two-story cottages. To have the latter built under the same rules that safety requires for the former is a mere mimicking of London, which does good to nobody except the local surveyor, who by this craft has his wealth. The council would recognise this, and would not insist on brick walls for detached and semi-detached cottages. As regards them, they would just leave matters as they are for the present. If any special evil proved after a little while to need repression, they would make a special by-law to repress it; but they would not start by enforcing, in semi-rural places, all the "shalts" and "shalt-nots" that are wanted where the inhabitants are a hundred thousand to the square mile. When, or if, the village houses begin to be built in rows—an undesirable practice as regards light and air, which the encouragement of semi-detached ones would greatly prevent—it might be wise to insist on bricks, stone, or concrete for the wall material, not wholly excluding wood framing, but not allowing it to run through or across the party-walls. Barns, sheds, and buildings of the warehouse class, if detached and at a reasonable distance from other premises, might be built as they now are. Even councils and boards cannot regulate everything. If they insist on fireproof sheds, they will still have to stop short of fireproof haystacks.

On the other hand, it is easy and useful to provide for a certain amount of spare ground to each new domestic building, and especially to prevent the building of houses and cottages back to back. But rules should be as few and simple as possible, and those directed to these ends should be so framed as not to result in rigid formality of line. This may be natural in the crowded part of a city, but it is simply hateful in a place which is resorted to only as an escape from cities. Plenty of light and air, but no formal frontage lines, are the conditions which make a beautiful village, and a village wholesome for body and mind. Sensible men without education have always seen this, and have made our old villages what they are; people of cultured taste see it still. But the village boy, who gets a little, and only a little, education, fails to see it. He wants something grander, more regular, more like the town; something with straight streets and even frontages, with all the footpaths paved, and all the houses alike and equidistant, as if they had been dibbled in by a string, like so many cabbages. We may call this the Board-school boy's ideal; an ideal which he will outgrow if ever he gets much above the standard he finally passed in,—but which he will cling to more and more through life if he remains a melancholy example of arrested development.

SHOREDITCH BATHS AND (PASSMORE EDWARDS) LIBRARY COMPETITION.

It is hardly possible for one architect to produce the best plan for each of the distinct buildings required; but it was this principle of adjudication which the assessor and the commissioners seem to have thought necessary. If their idea was to make a façade that was homogeneous and uniform, and that, therefore, the architect who sent in the most satisfactory united façade ought to be selected, one need only say such an opinion is contrary to a correct architectural conception. Every building, if possible, should tell its own tale, so that people wanting to find out the public baths should not mistake which are the baths and which the library. We might have both departments combined in one elevation, but so distinguished in character and detail that each could be distinguished. But it appears the commissioners were desirous of awarding the first premium to the author of a joint design, the consequence of which is that they have not been able to secure the best skill or plan for both the baths and the library. It would have been wiser to have divided the premiums for the two schemes, and have obtained the plans of experts for each building separately.

The question has again arisen whether the commissioners or their assessor have fairly complied with the London County Council requirements as to the first-class swimming-bath, and we hear that Mr. Tiltman and other competitors are taking steps to inquire on what grounds the decision has been arrived at, so far as the utilisation of the large swimming-bath for entertainments is concerned. A clause in the conditions distinctly affirms that "none of the designs for baths will be considered accepted until the L.C.C. have approved of the first-class bath as a public building for entertainments," and it is for the commissioners to show, if they can, that their selection of a design is in accordance with these regulations. Till the plans have been submitted to that body, and their license provisionally obtained, no definite decision can be arrived at.

Last week we had only the opportunity to describe the general arrangements of two of the selected designs, and therefore our comments in respect of them must be accepted with this explanation. We had not the advantage of comparing them with others, and therefore could not judge of their relative merit in the competition. We have to add to our general remarks on the selected design that a closer examination of the plan has revealed some points of weakness. The inadequate means of exit and staircase communication from the large hall or bath will make it difficult to be used, especially as a public hall. The stairs at the end do not communicate directly with the street, are insufficient for the use of a large assembly, and would not pass the requirements of the London County Council. Two staircases, at least, are necessary. The two north-side emergency exits to Bowling Green-walk are scarcely sufficient for the egress of a large crowd, and the entrances to hall at the west end on ground level would be better if they were more central, and not confined to the corner of hall, as they are now, by the women's first-class slipper-baths, which might have been better placed elsewhere. If these doorways have to be closed by iron doors, easy egress would be impossible. The doorways to large hall or bath are certainly small. Another point to which exception may be taken is the position of the club-room at end of corridor on the south side of large bath. They would have been better in a more central position. The library arrangement is, on the whole, better, with the exception of the space for the public to which we have referred, and the position of book-store on first floor and the access to it. The news-room and lending-library are in good relative positions, both on the ground floor, a point which has been overlooked in many other good designs. Book borrowers constitute a large class of those who attend libraries, and it is undesirable that they should have to ascend a flight of stairs where proximity to the entrance is necessary. The basement windows in front, close to Pitfield-street, are objectionably close, and liable to be broken. We publish the chief plan and elevation this week.

As we said last week, Mr. A. Hessell Tiltman's design had been withdrawn by that gentleman, and one could give only a very brief notice of it. Having since had the opportunity of inspecting the plans and details, we have no hesitation in expressing our opinion that the design is a very able one, complying more fully with the actual requirements than any which have been selected, while the author has brought his own expert skill and judgment to bear upon the problem. Mr. Tiltman has complied with the first condition in planning his large bath in the matter of entrances and exits, whereas the plan selected, whatever its merits, fails to do so, and on this ground he resents the commissioners' decision. The license of the L.C.C. for the use of first-class swimming baths for assemblies and entertainments cannot be given unless certain structural requirements are carried out. But there are other features of the plan which have apparently been overlooked by the assessor. The quadrangle introduced in this plan, though it may be thought by a few to be inapplicable here, is really the only practicable means of economising the labour and cost and reducing the length of corridors. As a master of administration and structural detail, the author knows every item in the working arrangement of these establishments, and several advantages of the quadrangle accrue; privacy to the regular bathers is secured; the street *gamins* and objectionable loafers cannot intrude within the actual precincts, for at the street entrance to the quadrangle a porter is stationed; no man or woman who enters can make a mistake; there is no long corridor to bewilder one, but only one short corridor to his or her bath; the ticket-office is central, and serves for both sexes; the administration is simplified, and labour is reduced. These advantages are made evident on examining the exceeding simplicity and concentration of this plan of entrances and corridors, and the grouping together of the subordinate offices. A waiting-room for women is immediately in front of the ticket-office, where they can obtain their tickets and proceed to their baths, by which all confusion is avoided. A spacious hall opening direct from the quadrangle gives access. Near the large bath, and adjoining lobby, is a spacious gallery staircase, which serves both as entrance and exit. There are three exits from large bath or hall into Bowling Green-walk, besides two staircases, one at each opposite angle, so that they divide the gallery equally. It may be mentioned, that two staircase exits at one end cannot divide the people in the gallery equally, and may lead to panic. We notice, also, that provision is made for a tea-and-coffee room next the outer gates, a matron's store, and the arrangement of women's slipper-baths is so managed that one woman attendant can see to the slipper-baths on first floor; the waiting-room is arranged between the slippers. The board-room is over part of commissioners' offices, and we notice that the club-rooms are convenient to the entrances and baths. At the east end of large swimming-bath we notice a swimmers' corridor, which forms also a performers' entrance and a retiring- or club-room, which corridor can be used for boy swimmers. In the fittings of washhouses, baths, and engineering details, the author has introduced a number of special features which a long study and experience have found to be of value. The washhouse is next Coronet-street, and the planning is well-studied in its detail. The main elevation is broadly and characteristically treated, the two portions being made outcomes of their respective plans. A gable and cupola at the side are features in the library front, and the building is intended to be carried out in red brick. We shall give the block plan and perspective of this design next week.

In the third placed design (Messrs. Groll and Todd) we notice several good points, especially the engineering arrangements in the basement, the provision for the connection of electric-light supply from central station, also the isolation of large bath or hall, which does not touch any of the adjacent buildings, the authors allowing the full distance of 21ft. from the end of bath to library. Gallery stair exits are shown at both ends of large hall, and an entertainment crush-room is shown at west end of hall; corridors are fully of the required width to meet the regulations. The first-class slipper-baths for men are on the first floor, and are "hung up like a vessel in a dry dock." The large-scale detail of elevations are well drawn. On the other hand, we see the lending-library is on the first floor, which is undesirable, and the borrowers' space looks rather small. The book-store is on the second floor, over lending-library, and is accessible by a spiral iron stair open to all the floors at one end. The elevations have been conceived in a Renaissance style, and the details are well drawn, and distinctly of North German character.

A strong plan, especially for its baths arrangement, is No. 31, by Messrs. Spalding and Cross. The large bath or hall, 121ft. by 59ft., can be used separately for entertainments, and is placed with its longer axis north and south, its end abutting on Coronet-street, where there are two public entrances and two gallery entrances direct from street. In addition to these are the two main corridor entrances from Pitfield-street for men and women, which corridors lead into large rectangular round-cornered halls, useful as crush-rooms, which give access to the large hall. A staircase to gallery and board-room is provided between these. Then there is a separate staircase to gallery at north-east corner of hall and a men's second-class exit from hall to Bowling Green-walk. The front ticket-office and corridors on each side of the men's first-class slipper-baths and the general planning of the entrances and exits are well arranged. The second-class bath is placed next to the Bowling Green-walk, with its slipper-bath between it and the end of large bath. The male swimmer can enter by his corridor in Pitfield-street and go straight to the first-class swimming-bath, or turn to the left by a short corridor from the same hall and enter the second-class bath. The women's first and second slippers are at the south end of large bath. The laundry is in rear, cut off by a suggested men's second-class exit from hall into Bowling Green-walk. The library plan shows a main entrance from Pitfield-street, with boys' room and lending-library on south side and the news-room on the north side of entrance. The position of librarian's room and porter insure supervision of this floor. Ample space for borrowers is shown in the lending-library. Above is the museum at the north corner over the newsroom, and the librarian's house is in front, with reference-library over the lending-library. The board-room and official department is above the main entrance, and disposed round the slipper-bath skylight. On the second floor is the book-store to reference-library, which has a gallery round it, and the librarian's rooms are in front. The basement plan shows the engineering arrangements and drainage. Brick and stone are used; the style selected is a sort of Renaissance. There is a want of unity and coherence between the two blocks; the library front having an ornamental gabled treatment over the main entrance. The section shows an elliptical roof, with lantern-light over the large bath.

The design numbered "2," by Mr. F. J. Smith, has also many strong points. The large swimming-bath has been planned with reference to its use as an assembly-hall, and is placed next the Bowling Green-walk. It has three emergency exits, and main entrance at the west end, through corridor from Pitfield-street. There is a vestibule to the hall, also a direct entrance from the side walk at the west end of the bath. There are four exits from gallery—two at each end. The second-class bath is next to the large one, and parallel to it; the men's first slipper-baths adjoins the second-class swimming-bath; the women's second-class are placed next entrance, between the corridors and the men's, at the back of the old houses. The washhouse and laundry adjoin, with entrance from Coronet-street. The library is also well arranged in the general location of the departments, and these appear to be under control. There is a good hall and vestibule from Pitfield-street, and the lending-library and public space are convenient in size. On the east boundary there are two areas for light and air over the ground floor; the stair-landing gives access to the magazine-room and museum in front, both on the north side, and a reference-library, with librarian's room, on the other side. These are well lighted from the front and north side. The reference-library has a good gallery, and the librarian's house is on the second-floor. A spacious book store is provided in the basement below the lending library. One merit of this design is the separation of baths and library buildings. These are treated also separately in the elevation, the former being kept low and plain. The façade is broken by bay windows, the library building being set back with bay windows to reading-rooms. A well-drawn ink perspective accompanies this set of plans, which are neatly finished, and show all the fittings of baths and library. The corridor to women's baths is narrow. No. 7 has a well-thought-out plan; the large bath, or hall, has two hall and gallery entrances from Coronet-street end, and the author has taken care to consult the separate use of the hall, and its means of ingress and egress for swimming and entertainments. The second-class large bath is placed parallel, and next to Bowling Green-walk, at right angles to the first. Spacious corridors, and hall through waiting-rooms are shown. There is a central entrance-hall and stairs. We do not like the position of ticket-office where shown, between the corridors. The second-class men's slipper-baths are between the large baths and men's first-class on first floor at side of large bath, and the women's on the other side. In the library plan there is a good borrowers' space behind entrance hall, with magazine-room in front on the right-hand side of entrance. The museum occupies the corner above. The elevations are in a commonplace Classic style, a distinct treatment for each building, though in one. The basement plan, showing inspection corridors round baths and engineering details, is prepared with some practical knowledge. No. 8 (Messrs. Gibson and Russell) has the two large baths, as in the last, at right angles, the larger one its end towards Coronet-street, with three exits and stairs to gallery; the second-class bath is placed along the north side. There is a good entrance-hall and corridors for men and women, the latter to the right of public staircase. Between the corridors are the second-class men's slipper-baths, and the first-class for men on the first floor, and the women's are next to large bath at south end. The laundry and ironing-room are in the rear, with entrance from Bowling Green-walk. The library is faulty, the lending department is on first floor, and reading-room at corner of site. The museum is over the entrance. On the floor above is the reference-library and book-store—not very convenient, and the librarian's house is in front, and occupies the upper story as well. The details show study; the elevation is of suitable Free Renaissance character, and a separate treatment of buildings is shown in it.

A few other designs call for brief notice. No. 1, in its external perspective and elevation is of imposing Classic design, with massive corner towers; the large bath is in the centre, with the washhouse on north side, and the smaller swimming-bath at right angles, with end abutting in Coronet-street. The front entrances have large elliptical-shaped inner halls and waiting-rooms for the two sexes. The entrances and exits to large hall are inadequate; the men's first-class slipper-baths are on first floor over washhouse, and those for ladies over entrance-hall, approached by stairs from it. No. 10. In this plan the large hall is also north and south, with end "escape corridors" to Coronet-street; the other swimming-bath is next Bowling Green-walk, and washhouse in rear. The library is not satisfactory in arrangement. No. 18 has a large bath, or hall, with three exits on north side; but the corridors are devious. The second-class swimming-bath is detached, with end to Coronet-street. The entrance to large bath is cramped. A clever ink perspective artistically treated is sent. No. 34 is also a well-drawn and artistic elevation of English Renaissance. The large hall is on north side, with entrance and exits from Bowling Green-walk; the second-class swimming-bath is alongside Coronet-street, with washhouse between; this is an unsatisfactory arrangement. The library is better than the bath planning. No. 28 has the large bath north and south, with exits in Coronet-street, and the other bath is parallel to north side, with workhouse in the rear. The entrances are not satisfactory, and the elevation is heavy and ill-balanced, and of ambitious character.

No. 24 (Messrs. Hall, Cooper, and Davis) shows the large bath with its end to Coronet-street, with two exits and three entrances on the western side approached from the Pitfield-street entrance. These entrances to large hall are in a cross corridor, which forms a kind of hall, and the corridors giving access to it are ample and direct. The slipper-baths for men are between the entrance corridors from the street, and the second for women are placed between the large bath and the small swimming-bath, which latter is placed along the north side. The planning is generally good, and the washhouse is placed on the east side. The library plan is is even better, and the authors have complied with the condition as to windows in the wall between library and baths by providing a passage-like area for light and lighting the lending-library from it. The plan sacrifices space, but is one way of satisfying a condition that, to say the least, could not be easily complied with. Some of the plans have shown windows above the roofs of baths.

Other plans of more or less merit we can only glance at. No. 35 (Messrs. Chas. Bell and Cheers) has some good points in the bath planning. Nos. 5, 6, 9, 13, 14, 19 have carefully drawn plans; but they have all some defect, either in the baths or library. A few of them have artistically-drawn perspectives. Had the conditions been less particular and rigid, allowing more option on the part of competitors, better results might have been obtained.

* * *

INACCURATE QUANTITIES.

No one can expect the quantity-taker to be infallible. We may affirm, indeed, that very few bills of quantities are not without defects of omission or excess. The architect or surveyor may do his best to insure accuracy; but accidental circumstances will arise, which he cannot foresee, and throw out his calculation of material or labour. Is he to be made liable? The Courts have held pretty clearly that a builder cannot recover for inaccurate quantities against a quantity surveyor unless there is some contract between the surveyor and the builder by which the former agreed to render services for reward; and such a ruling is quite justifiable, for if the surveyor is to be made the victim of every disappointed builder who finds an omission, his life would be a sorry one, and he would be constantly at the mercy of the unscrupulous under-bidder or speculator. When the quantity surveyor has been employed by the architect for the building owner, for the usual purpose of getting in tenders and of obtaining a careful estimate of the cost, for the joint advantage of both parties to the contract, it is unfair to expect that extreme accuracy which some builders imagine they should obtain. In the recently-tried case of "Priestley *v.* Stone" the principle was affirmed that the surveyor should not be made liable for inaccuracies arising by custom. The quantities are prepared for a given purpose—to enable the builder to give a tender upon a certain statement of materials and labour, and are not guaranteed by either employer or his architect. The builder takes the whole risk of the accuracy of the quantities. If there is any omission or excess, the contract provides means for adjustment. Sometimes the architect is sued for supplying inaccurate quantities. The custom is frequent in certain localities. We do not think the practice unassailable. It may be unobjectionable in small works; but if the builder pays, the architect is placed in a much less independent position, should differences arise between the builder and himself. The case of "Scrivener *v.* Pask" is important. Where a builder entered into a contract according to plan and specification upon an erroneous statement of quantities which were taken out by the architect, it was held that the builders had no claim for more than the contract price in respect of extras beyond what he supposed would be necessary, inasmuch. as the architect had not acted as agent of the employer in taking the quantities out, nor was the latter responsible for mistakes. To avoid any disagreement we think the rule laid down at the Conference of architects and surveyors on this question is a good one—namely, that when an architect supplies quantities, he should do so with the concurrence of the employer, and that the architect should be paid by the latter, rather than by the builder. For it would seem, from one decision, "Bolt v. Thomas," that where an architect takes out quantities, and is paid by the builder, he may be made liable, unless he can show an employment by the building owner express or implied. An architect was sued for supplying inaccurate quantities by a builder. The former advertised in the usual way that plans were to be seen and quantities obtained, and the builder obtained a copy of these quantities, which were to be paid for by the successful competitor, and upon the quantities furnished the builder made his tender, which was accepted. The latter also stated that the architect had told him that he, the architect, was responsible for the quantities. In summing up, the Judge said that, as the architect had stipulated that the plaintiff should pay him for the quantities, and having been paid for, he was liable to compensate him if the bill was not reasonably accurate. But where the architect takes out the quantities of the work for the owner with his knowledge, then the builder cannot sue the architect for inaccuracy or negligence. In one case ("Young v. Blake") the architects were ruled to occupy a quasi-judicial position, and could not be sued for negligence. The builders alleged that they employed the architects for reward, and that the latter warranted the accuracy of the quantities; but the judge held that there was no warranty of accuracy by the architects. These are instances of the judgment of the Court cited in legal handbooks, and they serve to indicate the principle that when an architect takes out quantities for his client, and with his concurrence in the usual manner, the law protects him from any charge of inaccuracy made by the builder; but when a builder employs the architect directly, there is an implied contract that the quantities are to be accurate; hence the importance of these documents being made a part of the contract. Quantity surveyors never guarantee the accuracy of their bills, but generally introduce a clause to the effect that, should any error be found, the architect is to have the power to measure the work. An agreement between owner and surveyor as to payment for the quantities. with a clause protecting the former against mistakes, is necessary.

BOARD SCHOOL ARCHITECTURE.

At the meeting of the Manchester Society of Architects on Tuesday week, a paper was read by Mr. Charles H. Wyatt (clerk to the Manchester school board) on "Requirements in the Planning of Board Schools." Mr. John Holden (president of the society) was in the chair. Mr. Wyatt disclaimed any pretension to be a master of the many technicalities which are necessary for the man who would successfully design a public elementary school. He was not an architect; but the views which he would lay before them were based on a practical acquaintance with school life and on the experience he had acquired as to the working of public elementary schools in Manchester. The first necessity for a school was a suitable site, and at this point, particularly in large towns, there was often a difficulty. But presuming that they had a piece of land, an acre or an acre and a quarter in extent, upon which it was proposed to build a school for about 1,000 or 1,200 children, they would have ample space for playgrounds, and there would be no necessity to consider the matter of roof playgrounds or any utilisation of basement space for this purpose. The building should, if possible, face the south, and it was desirable that the school itself should stand as far as possible from the main thoroughfare giving access to the premises. At one corner of the site, preferably at the front, he would place the caretaker's house, so arranged that he could from his windows overlook the greater part of the playgrounds. The best surface for the playground that he had seen was that known in Scotland as granolithic pavement. Asphalte playgrounds were common in England; but care should be taken that the ground was allowed to settle before the asphalte was put upon the surface, and the work should be carried out under a rigorous specification giving the thickness of the various ingredients composing the asphalte. At Bolton the playgrounds were flagged, and members of that board regarded the method as satisfactory. Coming to consider the school premises proper, Mr. Wyatt said that the ideal limit of the cost of erecting a public elementary school was that fixed by the Education Department for the purpose of the loan, and unless there were exceptional circumstances, this was placed at £10 per head. Some boards, however, did not go to quite this limit. In Manchester £9 per head was thought sufficient to cover the cost of erection and equipment of an ordinary elementary school. With this limit of cost in view, and allowing for the provision of extensive playgrounds, boundary walls, offices, &c., it was clear that such a limit of expenditure did not provide for any extensive basement. There should, however, be in the basement a kitchen for the caretaker, for in the case of a school in a poor locality, where, through private munificence, free meals were provided for poor children, it was almost a

A STREET CORNER IN MAYENCE.

necessity to have a roomy apartment where these meals might be served. The lecturer went on to illustrate the design of a school by means of lantern slides prepared for the purpose. The classrooms should invariably be lighted from the left. He was a firm believer in plenty of window space for schools. There should be ample cloakroom accommodation for the children, and for this purpose iron fittings were preferable. Some arrangements, too, ought to be made by which the cloakrooms could be aired. In the case of a school belonging to a board, something of its municipal character should appear, and he would have inserted in the windows the armorial bearings of the town. Much art might be shown in the design of such windows. Heavy stone mullions were objectionable, and he had seen a very happy effect obtained by light wooden divisions designed to represent a slight column intersecting the divisions of large end windows to central halls. In speaking of warming and ventilating, he knew himself to be on dangerous ground; but open fireplaces had obvious advantages over other methods. Every classroom and cloakroom should be provided with a ventilating flue, and each central hall should have at least three such outlets formed into the walls, except those on the top floor, where they could be taken by means of tubes from the ceilings. The ventilation of the classrooms might be improved by means of glazed, draughtless ventilators fixed in the lower portions of the window-sashes. In Manchester it was not allowed to introduce any patent apparatus without the express consent of the Sites Committee. Hot and cold water supply should be laid on each floor. As to school furniture, Mr. Wyatt said that it was very seldom one saw a properly arranged museum in a school, though one might often see cupboards with glass doors, and the shelves so high that their contents were almost out of the view of the children. A museum, particularly for infants' use, should not be much above dado height, and the glass should be brought down within the nearest possible distance of the floor. It was of serious importance that the cost of school erection should be reduced within the most reasonable limits. He did not mean that the schools should be imperfectly built; the materials and structure should be sound in every part; but much money might be expended on outside ornament which, considering the limits, did not bear money value. In Manchester there had undoubtedly been an attempt to carry out a type of school which some might think planned on lines too severe. He granted that no attempt had been made to achieve any great architectural feature; but a building suitable for the purpose, and one of no disgrace to any locality, might be erected at a cost well within the limit laid down by the board—viz., £9 per head. They wanted substantially built schools, well equipped with everything necessary for the instruction and healthy recreation of the pupils, avoiding, however, anything in the shape of unnecessary outlay and extravagant design.

THE LONDON COUNTY COUNCIL.—MR. BLASHILL'S RETIREMENT.

At Thursday's meeting, the General Purposes Committee reported the receipt of a letter from Mr. Thomas Blashill, F.R.I.B A., the superintending architect to the Council, intimating that he had attained the age of 65, at which, by the standing orders, he should retire. The committee recommended that, having regard to the peculiar circumstances of Mr. Blashill's case, and as his retirement would cause inconvenience to the public service, he should continue to hold his appointment for another year, and that meanwhile the committee should report what (if any) changes in the work of the architect's department were desirable. This was agreed to. The report of the Main Drainage Committee, recommending extensive additions to the main drainage system of London north of the Thames, came up for consideration. The scheme contemplated the construction of an additional outfall sewer between Old Ford and Barking, a new intercepting sewer from Paddington to Old Ford, and relief works. The total expenditure for these additions was estimated at £745,000, and the works would not be fully completed for about four years. Mr. M'Dougall moved as an amendment that the general enlargement of the main drainage system was not now necessary, but that local floodings needed immediate attention. After considerable discussion the amendment was carried by 55 to 18 votes. A recommendation for the execution of certain relief works at an estimated outlay of £50,000 was agreed to. The consideration of the report of the Parliamentary Committee with reference to the water question was postponed till next week. A long discussion ensued, on a recommendation of the Main Drainage Committee, that the tender of Messrs. Gwynne and Co. for £2,272 for centrifugal pumps for Heathwell pumping-station should be accepted, when there were three lower tenders. It was pointed out that Messrs. Gwynne and Co. were the original patentees of these pumps and were a London firm. The lowest tender came from a firm with little experience of the manufacture of these pumps, the next was informal, and the third was only £72 below that of Messrs. Gwynne. An amendment to refer the report back was defeated, on a division, by a majority of 31, and an amendment that the contract should be given to Mr. J. Cochrane at £2,200 having also been defeated, the recommendation of the committee was agreed to.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XX.—GERMAN RENAISSANCE.

THERE are so few buildings of the Renaissance in Germany, and the style was adopted there so late, and deteriorated so rapidly, that it would be of little importance had not the deterioration been upon fresh lines, resulting in domestic work of a character which it has been fashionable of late years to imitate, and, it is to be hoped, to improve upon, in England.

Omitting the beautiful Rath-haus at Rothenburg from consideration, as being rather French than German in its characteristics, one of the earliest, and at the same time purest, works in Germany is the Portico to the Rath-haus at Cologne. It is of two stories, with an order (Corinthian) to each story, the columns being raised on pedestals having carved panels. Its peculiarities lie in the combination of the order of the upper story with the pointed arch, in the heavy modillions in the upper cornice to give it power and so to fitly crown the building, and also in the carving of the lower portions of the upper columns. In the employment of the pointed arch it is unique, the combination, owing to a prejudice against it as never having been employed in Roman work, being unpopular; why, it is difficult to say, for there is nothing in its use at Cologne to hurt the eye or cause shock to the most fastidious. Less skilfully treated, however, it is easy to understand that the lines would clash with those of the entablature.

The Castle at Heidelberg is generally pointed to as the typical example of the German Renaissance, and, though it undoubtedly owes much of its charm to its romantic situation, it is well worth study, especially as the two Renaissance wings are of different dates, and show how the typical German grew out of the imported Italian style. In the view given of the courtyard, the wing on the right-hand side, now dismantled, is early, and of Italian character, while the inhabited wing on the left, with the tall gables, is essentially German. This is most evident in the details. In the mullion from the earlier portion, which is illustrated, for instance, in spite of the peculiar forms which the Doric and Ionic Orders assume, there is an elegance of feeling and proportion which marks it at once as the work of a Latin,

(*From a Sketch by* Mr. E. R. Barrow.)

and not of a Teutonic, race. The novel position for the Orders—in a window mullion—might also have been looked for in the earlier times in France; and even with so small a division between the two as is formed by the narrow transom, and with so insufficient a base as there is to the caryated figure, they yet form beautiful adornments, perhaps the most universally employed of any in the whole range of architecture, and this when their constructional function has been quite lost sight of.

Mr. Barrow's sketches of the pilasters are from the later, the more characteristically German, portion of the castle; and here we find the Doric Order superimposed upon itself, and of an entirely new form—the lower with excess of taper and entasis, the column banded in two places with raised panels, and enriched with carved ribbon-like scroll-work, the capital carved with the egg-and-tongue, the architrave in two faces, and the frieze carved with the scroll-work again; while the upper is raised upon a slight pedestal, having the columns void of either taper or entasis, and enriched with carving for about a third of its height, where it is banded with a simple roll, and having a frieze of triglyphs and metopes, while a console takes the place of the triglyph over the column. The effect is rich and massive, as far removed from the original simplicity and dignity of the Doric, as it is also from the refined delicacy of French or Italian work, and this effect is heightened by the crowding of the windows, themselves full of heavy ornament, against the pilasters, and the breaking of the pediment in the upper story window through the frieze of the order. It is unrestful, overladen, and yet in its way satisfactorily massive.

As to what this resulted in in the smaller domestic buildings, a glance at the sketch of a street corner in Mayence is sufficient to show. There is a tall gable enriched with coarse scroll-work and banded at intervals with cornice mouldings, and there is an oriel window at the corner similarly enriched. It is the domestic form of the German Rococo, displaying wealth but lacking in refinement, and when this deteriorated both in form and detail, as it did in "quaint" Holland, the terrible badness of the result may be imagined. Yet, founding their work upon this, selecting its good points, and designing with care, modern English architects have produced much which is admirable.

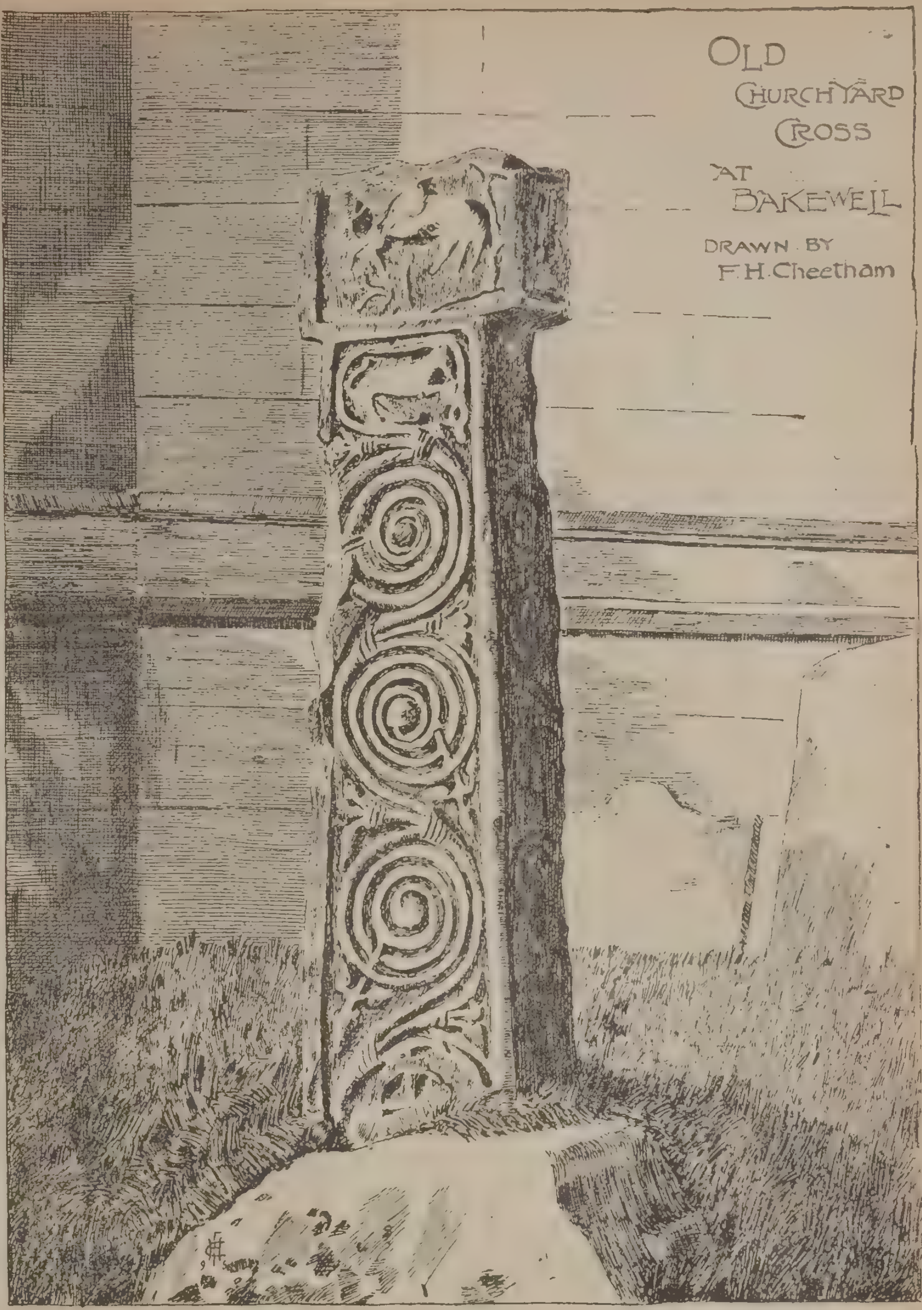
◆

THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting for the present session was held on Friday evening. The President, Mr. W. D. Caröe, M.A., F.S.A., who occupied the chair, announced that a tour to Greece would start on Wednesday, December 18th, under the guidance of Mr. Hugh Stannus, and that the Committee had decided to open the new Handicraft Class to all their students, irrespective of their belonging to the Class of Design or not.

SCENIC ART.

A paper on this subject was read by Professor Hubert Herkomer, R.A., and at its conclusion the President announced that, at the lecturer's request, there would be neither a vote of thanks nor a discussion. Mr. Herkomer said that, though he did not set himself up as an architect, or even pose as a reformer, he thought, as a worker, there were many reforms that could be suggested in the matter of the theatre, and he wished to give those present the benefit of his thoughts and reflections, and might suggest many changes. Treating the subject of scenic art from the point of view—first, of the auditorium; second, realism on the stage; and, thirdly, the lighting of the stage—he pointed out that the semi-circular shape of the auditorium of the present theatre had its prototype in pre-Christian structures in Greece, where the auditorium was scooped out of the rock. The Roman theatres were copied from the Greek originals, but were constructed on level sites. Then there was a change in the well-like shape of the theatre in the Middle Ages owing to the temporary accommodation needed by the strolling players. The deep, well-shaped theatre had thus been bred into our natures for many hundreds of years, and it would necessarily take some time to breed it out; and in looking at its conveniences and inconveniences he argued that the principle attending its construction should be to provide seats from which the full intention both of the actor and the scenic artist could be perfectly seen by the audience. No doubt for economical reasons the builders of theatres had been compelled to adhere to the old form of auditorium, which was nothing more nor less than a great well. He was fully aware that the form of auditorium in Wagner's theatre at Bayreuth (which to the lecturer was the only correct form) was not easy to carry out in London or Paris. Still, he believed that a modification of this principle was possible, and that some form of auditorium with an entirely new method of distributing the seats could be invented without encroaching too much upon ground space, and at the same time without reducing the number of seats required to make the theatre pay. Here was a chance for the budding architect! In any case, the principle should be to provide seats from which the full intention of both actor and scenic artist could be perfectly seen by the audience. An actor should study his actions as much as his tone of voice, and in many cases his meaning should be made clear to his audience by his movements alone. But how was it possible to make his movements convey at the same time the right meaning to the person who sat 30ft. or 40ft. above him and the person who sat lower than his feet? The lecturer showed that the hanging committee at the Royal Academy, in criticising the drawing and painting of a picture, had the picture placed in front of them, and according to their position in the semicircle the views of the onlookers with regard to the drawing of the subject varied. The reasonable placing of the spectator at the theatre was of equal importance in judging, not only of the movements of the actor, but of the efforts of the scenic artist. Positive realism on the stage was an impossibility. The foundation of scenic art was an artificiality, and open-air plays could never be satisfactory. The actuality of nature and the artificiality of the actor's situation could never blend. The real secret of perfect scenic art lay in illusion, in deception, in not allowing the eye of the spectator to see the means by which the semblance of reality was obtained. Thus the make-up of the background should be held to be of equal importance with the actor's personal make-up; if they dispensed with the one, they might as well dispense with the other. It was through his craft that the actor made one realise nature, and it was through artificiality that his craft became expressive. Many people who witnessed one of the lecturer's plays took it for granted that he had opened out the background so as to bring actual nature into the line of sight, for to them the distance looked too real to have been artificially produced. After the performance he allowed them to come on the stage to see by what means the illusion had been obtained, and it was curious to note the tendency to resent the "trick" whereby their eyes were deceived. Some even seemed to doubt his honesty, and might have gone away with the idea that he did not show them the real method whilst they were on the stage; but they hardly realised how, through the management of lights, the strangest deception could be practised upon the visual organs. By means of absolute control of the lights, they arrived at mystery, and without mystery the very backbone of scenic art would be broken. It was this want of mystery, through the presence of daylight, that caused the Oberammergau "Passion Play" to appear so unnatural to the lecturer. He regarded the stage as a medium through which the greatest truths in nature could be brought most direct to the minds and hearts of the people, and all the arts in their fullest capacity could be united in this form of expression. He bore testimony to the valuable work of Sir Henry Irving in the direction of scenic improvement on the stage, and remarked that the scenic work, even as they saw it at its best at the Lyceum, was still on the old lines, and hence the greatest capabilities of art could not be reached. The scenic artist must be a born experimenter, with the faculty of seizing artistic accident: the inventor of ways and means; he must be of an imaginative as well as of a practical turn of mind, strong in body, and indefatigable in his energy, and withal a first-rate artist. It was to the scenic artist that the actor should look for the completion of his dramatic situation; the scenic mood thould be consistent with the play, and it should reflect that of the actor, or strengthen it by force of contrast. The lighting of the stage was a momentous question; but here, again, traditions stuck to the stage more than to any form of art. In this department be did not undervalue the enormous difficulties which beset the theatre authorities in pleasing a mysteriously constituted public. Yet some radical changes could be made in the lighting of the stage. Take the sacred footlights. The footlights were simply the survival of a period in which the lights had to be given with but poor material. Footlights were convenient; but they were chiefly to blame for the false and unnatural aspect of the stage. In discussing where to place the lights, Professor Herkomer mentioned his own experiments at his theatre at Bushey when engaged in the production of his pictorial music play. He found that the shadows on the faces of the actors could be softened by a group of lights placed a short distance at the side, and level with the actors' faces. These lights he afterwards boxed up, so that they were perfectly hidden from the audience, and only gave their light to the stage. The result was, to the judgment of a painter's eye, as nearly as possible that of diffused daylight. He admitted that in adopting this plan more generally the prejudices of the actors themselves would have to be got over, while the amount of illuminating power and the height of the lights from the ground would have to be adjusted by careful experiment to each stage. The lecturer considered further that the proscenium should be to the stage picture what the frame was to the easel picture; it should separate the picture from the surroundings on the stage picture just as a painted picture should reach the frame. In most cases the proscenium was built so high that there was a considerable space which had to be covered with curtains. Indeed, year after year theatres were built without the designers apparently inquiring what might be the real function of the proscenium. The result was practically the same as if artists were to send their pictures to the Royal Academy with frames a foot too high for the pictures, and the intervening space covered with a piece of "Liberty" silk. He suggested that the proscenium should be made o contract and to expand, the lecturer illustrating his argument by a wooden model of his own construction, whereby, by means of a handle at the side, the sides and top contracted and expanded to suit the requirements of the stage representation. But with the fixed proscenium as at present constructed, the room of a cottage or a garret had to be represented on the same scale as the palace. The house was first represented, and then a room in that house; but the room was often much larger than the house. The eye of the spectator was never properly prepared for the great climax of the scene, because the trivial incidents leading up to it had been represented on such a large and disproportionate scale. If his suggestion, on the other hand, were adopted, the scenic artist could carry out all the laws which governed pictorial composition in art; the lower side boxes could not see less than they did now, and as for the higher side boxes, let them perish. Again, the curtain should not be raised, but should be opened from the centre. His own efforts at Bushey had been directed to realise the painter's view of nature, and he maintained that the stage picture should call forth the highest powers of the painter. Scenic art should not be held to be an inferior art to that of painting, and the greatest painter of the day should find some pleasure in such work. In conclusion, Professor Herkomer described his effects of lighting as carried out at Bushey. Daylight was not, he urged, garish; and in no light in nature was every object fully lighted up at any one moment. Yet so crudely were lights—electric lights especially—employed on the ordinary stage, that every device, every artifice, was cruelly shown up, and then good-bye to quality. Brilliancy was not to be obtained by extravagant lighting, which would only result in garishness. Pictorial brilliancy was obtained by the very economy of light. Why were they so afraid of leaving some parts of the stage picture suggestive and indistinct, as artists left parts of their pictures? The actor's intentions ought to be made to harmonise quite as much with the intentions of the scenic artist as the artist's painted figures were made to harmonise with the backgrounds of his pictures.



CROSS AT BAKEWELL.

IN his "Churches of Derbyshire," Dr. Cox writes as follows of the Cross at Bakewell:—"The fine cross that stands in the churchyard of Bakewell, near the east wall of the Vernon Chapel, is 8ft. high, exclusive of the base, and about 2ft. in width. . . . The east front, which has at the top a mutilated representation of a man riding (perhaps Christ's entry into Jerusalem), and the two sides are sculptured with an elegant spiral scroll pattern; the west front has a series of sculptures down the whole face, the upper one representing the Crucifixion. . . . There is nothing unusual in supposing that there were several other crosses of the same style (though perhaps that now extant was the finest) in the churchyard of Bakewell. . . . These crosses were probably to the memory of some distinguished Christian or Christians. We have taken much trouble to arrive at a sound conclusion on the subject of the age of these Derbyshire crosses; but we give our opinion with diffidence in the face of the divergence of opinion that exists among able men." After comparing the Derbyshire crosses with those at Ilkley and Aycliffe, Durham, which are usually attributed to the years 782 and 789, he proceeds: "It is true, on the other hand, that both scroll and knot-work are occasionally, though rarely, found in the ornaments of Norman work; but anyone who has studied the sculptures themselves, as well as engravings and drawings, can at once detect the difference of style and finish of the two periods, and would not for a moment assign any of the Derbyshire crosses to the later period. That they are Anglo-Saxon (except that at Taddington) we take to be undoubted, and we also feel fairly assured that the Bakewell Cross, and several of the fragments, are not later than the eighth or possibly the ninth century, but we incline to the eighth."

Regarding the sculpture on the east front of the cross, Professor G. F. Browne, F.S.A. (now the Bishop of Stepney, D.D.), in the *Proceedings* of the Derbyshire Archæological Society (Vol. VIII.), writes as follows: "It will be seen that the ornamentation of the great cross at Bakewell consists of a magnificent scroll, springing alternately right and left from a sort of cornucopia. The scroll at the top has a somewhat nondescript animal nibbling at the topmost bunch of fruit. Now, the Northmen believed in a sacred tree, known as the world-ash, in which four harts nibbled the buds. The tree was, besides, a pathway for the messenger between the gods and the earth, and this messenger was the squirrel. I suggest that the animal on the Bakewell Cross recalls this early belief, for, nondescript as it is, there is no question at all that its forelegs clutching the fruit excellently represent the attitude of a squirrel with a nut in its paws. In this case we should have . . . . a combination of the Christian and Teutonic religious beliefs, the

Christian tree of life, and the Pagan messenger of the gods in its topmost branches." The drawing is by Mr. F. H. Cheetham.

GOLD-MEDAL YEAR AT THE ROYAL ACADEMY.

ARCHITECTURE at the Royal Academy is represented this year by the students' work in rather an unequal fashion, and the impression left on the mind, after inspecting the competitive drawings, is that but little progress has been made during the past twelve months. The designs shown by the Upper and Lower schools are, on the whole, better and more representative in character, while the Silver Medal is strongly competed for by nine sets of measured drawings of William Kent's famous building in Whitehall for the Horse Guards, and the best set seems to have been chosen. We have no fault, either, to find with the plans for a clubhouse, to which the prize has been given, for it is an excellent scheme in many ways. The result of the Gold Medal competition for the design of "a town church with a plan based on a Greek cross" is, however, inexplicable and most disappointing. That there is some originality, and likewise no little cleverness in the contrivance, no one can, of course, deny; but, on the other hand, the design displays an entire absence of knowledge of the ordinary requirements of a church, and as to the necessities of ritual arrangement, the author seems to have overlooked them altogether. The flights of ideal fancy in the direction of architectural conception untrammelled by mundane considerations may possibly tend to enlarge the capacities of the inventive powers, and we rocognise that mere commonplace restrictions may, to some extent, be disregarded by those whose lot is cast in the upper spheres of artistic sentiment, which presumably pervades the domain of the Royal Academy of the Fine Arts. It is, however, of prime consideration that a church design worthy of the distinction of a Gold Medal and £200 should at least be adapted to the modern requirements of church ceremonial. Unfortunately, on this occasion no regard seems to have been given to any such ideas. The design has no less than twelve towers; four of these stand as abutments at the internal angles of the cross, serving as supports to the low-proportioned and almost saucer-shaped dome of masonry over the central area. The remaining eight towers flank the four arms of the cross, which are roofed by semi-domes of like form to the central cupola. Inside, vast arches, curved on plan, carry the drum of the vault, which is lightened in bulk by coffered or arched ribbed sinkings, and in the place of pendentives big piers are run up to the main cornice or gallery level below the base of the dome. Deep curved splays at the end of the arms of the cross hide the flanking towers and give support to the arches over the columned fenestration, gathering in, as it were, the walling in a curious way towards the windows. These are more in harmony with a big railway station than a church of this class, and their ungainly ugliness is made more conspicuous by the incomplete forms of the windows and arches in the return walls of the crossings. The interior perspective is unfinished, and poorly executed, remarkable mainly for the idea of impossibility which it suggests, and the incongruous character of the design which it makes manifest. The gas pendants recall modern German work of the worst type. There is a certain boldness and simplicity of detail about the cornices and other details; but, on the whole, want of proportion and ungainly baldness have governed everything. The seating of the body of the church presents no novelty, and the organs flanking the sanctuary into which they project are elevated on tribunes having skeleton iron fronts, and supported by closely disposed colonnades hampering the chancel space.

No. 192 shows a design to much advantage by a well-drawn pen-and-ink perspective, and the author's drawings generally are capitally executed, with the sculpture admirably put in. His plan is distinguished by the attention given to the needs of such a building as a large church for a town site; but we are not prepared to say that the composition architecturally ranks really as a high-class production. Its detail is exceedingly well studied, and follows the Italian Renaissance of a florid, but admirable type. The choir projects into the central area of the dome, and the organ, with minstrels' gallery, is located in the south transept. The sacristy is on the south of the sacrarium, and the treasury is placed in a like position on the north. The morning chapel opens out of the south transept, and a similar chapel for guilds corresponds in the N. transept. An imposing baldachin gives dignity to the high altar, behind which is the presbytery in the apse. A baptistery occurs at the west end of the nave, and facing it on the north is another chapel of like size to be used as a mortuary on the eve of funerals. The dome of the church is somewhat commonplace with ordinary pendentives, and round the cupola a series of round windows occur, placed within recesses, a gallery walk extending through the intervening piers. The west front is bald, with an ugly semicircular window which repeats on the other façades, though these are not worked out on the elevations shown. We can sympathise with No. 192, and condole with him on his fate, as he worked hard for the medal, and, as we think, ought to have had it. We have no idea who the author is. The third design, No. 194, has a curious plan with curved arms to the cross—rather French in idea and treatment. Four abutment piers finished as dwarf towers rise at the angles of the crossing, with vestries contrived behind the two easternmost ones. The morning-chapel is in the apse beyond the choir, and would be very difficult of access. The following is a list of the works and prizes. The exhibition has been open to the public on two days during the week:—

Historical painting—"The Finding of Moses" (Ex. ii. 5)—gold medal and travelling studentship (£200), Harry Robert Mileham. Landscape painting—Turner gold medal and scholarship (£50), Cecil Ross Burnett. Landscape painting—The Bole and Roots of a Beech-tree—Creswick prize (£30), Edward Harry Read. Painting of a figure from the life (open to male students only)—silver medal, first, Victor John Robertson; second, Owen Baxter Morgan. Painting of a head from the life—silver medal, first, Cecil Ross Burnett; second, Arthur Huish Webber. Painting of a draped figure (open to female students only)—silver medal, first. not awarded; second, Rose Livesay. Cartoon of a draped figure—"The Death of Cæsar"—silver medal and prize (£25), not awarded. Design in monochrome for a figure picture—"Raising of Lazarus" (St. John, chap. xi.)—Armitage prizes, first (£30) and bronze medal, Alexander George Small; second (£10), Niel Kenneth M'Kechnie. Design for the decoration of a portion of a public building—"Autumn"—prize (£40), Harold Edward Speed. Set of six drawings of a figure from the life (open to male students only)—first prize (£50) and silver medal, Bernard C. H. Schumacher; second (£25), Shirley Charles L. Slocombe (disqualified owing to having received the same prize before); third (£15), Owen Baxter Morgan; fourth (£10), John Shenton Eland. Drawing of a head from the life—silver medal, first, Rose Eveline Clark; second, Mary Isabel Phelps. Drawing of a statue or group—silver medal, first, not awarded; second, not awarded. Perspective drawing in outline (open to painters and sculptors only)—"The Small Cloisters, Westminster Abbey"—silver medal, no competition. Composition in sculpture—Dædalus and Icarus—gold medal and travelling studentship (£200), Francis Derwent Wood. Model of a design—"Captives"—first prize (£30), Charles Beacon; second (£10), Alfred Bertie Pegram. Set of three models of a figure from the life (open to male students only)—first prize (£50) and silver medal, Francis Derwent Wood; second (£20), Charles Beacon. Design for a medal—a design for a cast medal, obverse and reverse, in commemoration of the Institution of the Order of the Garter—silver medal, Francis Derwent Wood. Model of a bust from the life (open to female students only)—silver medal, first, not awarded; second, Mary Towgood. Model of a statue or group—silver medal, first and second, no competition. Design in architecture—a town church, the plan to be in the form of a Greek cross—gold medal and travelling studentship (£200), Pieter Rodeck. Set of architectural drawings—"The Horse Guards"—silver medal. first, Archibald Haswell Christie; second, William Hawke. Set of architectural designs (Upper School)—prize (£25), George Weald. Set of drawings of an architectural design (Lower School)—prize (£10), Pieter Rodeck. Plan of a building—"A Club House"—prize (£10), William H. Edw. Brown. Original composition in ornament—silver medal, no competition. Perspective drawing in outline (open to architects only)—"An Interior View of St. Stephen's, Walbrook"—silver medal, no competition. The Landseer scholarships in painting and sculpture, of £40 a year each, tenable for two years, have been awarded—in painting, to Charles Henry Sims and Francis Owen Salisbury; in sculpture, to Clement William Jewett.

THE EDINBURGH SCHOOL OF APPLIED ART.

THE drawings executed by the students of the School of Applied Art at Edinburgh during the past season are this week on view in the galleries of the Royal Scottish Academy. On Friday the galleries were visited by the Lord Provost, magistrates, and council, who were received by Dr. Rowand Anderson, director of the classes at the school, who delivered an address explanatory of the objects of the school, and the degrees of success achieved. The school was started three years ago with the view of giving a wider education in art than was then obtainable to young men and apprentices engaged in trades and professions with which art is in a greater or less degree associated. An annual sum subscribed by employers of such labour was guaranteed for five years. The Scottish Board of Manufactures have assisted in the management, and have provided the necessary accommodation for carrying on the teaching, while the town council have voted £1,000 a year for its support out of the equivalent grant from the Government. The school has met such a felt want in the city, is carried on upon such practical principles, and has been so taken advantage of by the class of students for whom it was intended, that it is hoped something will soon be done to establish it on a permanent basis. One thing much wanted at present in connection with it is a workshop, where the practical details of art handicrafts could be better taught and illustrated; but unless assisted by some wealthy citizen, the directors do not see their way to providing such an adjunct. The drawings on view are largely of an architectural character. The figure has also been studied to some purpose, and last season great pains were taken to develop the study of colour for decorative purposes. A few examples of plaster ornament are shown as the fruits of the modelling class. The directors of the school are well satisfied with the progress made, and with the development along individual lines of the students' work. In connection with the classes there are Saturday afternoon excursions to notable mansions and buildings, where the students sketch, internally or externally, whatever appeals to them as the most interesting features of the places visited. The results of these excursions are likewise seen on the walls. Last year two scholarships of £50 each were founded so as to enable two meritorious students to devote their whole time, over and above attendance at the school, to the study of Scottish national art. These scholarships have been allocated, and the possessors of them have made a beginning at Holyrood in the study and reproduction of features in old Scottish furniture to be found in the ancient Royal Palace.

VENTILATION AND WARMING.

AT a meeting of the Society of Engineers held on Dec. 2nd, Mr. Wm. George Peirce, president, in the chair, a paper was read by Mr. William T. Sugg on "Ventilation and Warming." The author described in detail the method adopted at the present time for ventilating and warming the Houses of Parliament. The Debating Chamber, which is the most important point, has about 165,000c.ft. of air space when empty, and the temperature has to be suitably maintained both day and night when the House is in session, and an ample supply of pure air has to be insured. To this end fresh air, previously cleansed, warmed, and moistened in an equalising chamber beneath the floor, is supplied through a number of perforations distributed all over the area of the chamber. The floor is covered with a string-netted carpet, which does not obstruct the incoming air, and does not retain dust. By this means fresh air is supplied in considerable volume, at an almost imperceptible velocity, and, therefore, without draught. The extraction of the vitiated air is effected by aspiration through a large number of concealed openings all over the ceiling of the House, so that it may be as regular and uniform as possible from every part of the chamber. The ingress of the fresh air is slightly assisted so that there is never sufficient suction above the ceiling to encourage the entrance of air from the doors opening into the lobbies of the House, the air-supply always entering through the proper channels. The aspirating power which draws off the vitiated air is produced first by a number of argand gas-burners, which serve to light the House, and next by a shaft in the clock-tower. The vitiated air which passes into the chamber above the ceiling of the House is drawn thence by aspiration into a flue which descends into the basement, and is led to the clock-tower shaft. On the base of this shaft is a fire which puts the column of air in motion, and carries it up to the outlet. This shaft extracts the products of combustion and vitiated air from all the rooms, offices, and chambers of the House of Commons. Various modifications of this system, to suit different buildings and altered conditions, were described by the author, and were illustrated by examples carried out by him in practice.

* * *

It is said that the architects of Portland, Ore., have more work in hand and in prospect than ever before in the annals of the city.

NOTES ON APPROXIMATE ESTIMATES.*

CIVIL BUILDINGS, WORKS, &c.—(*Continued.*)

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
125. MANSIONS OR HOUSES. (THIRD CLASS.) "Villas." (Average height of rooms 10ft. 6in.)	7d.	£38	—
126. MANSIONS OR HOUSES. (FOURTH CLASS.) "Speculative" (Average height of rooms 10ft.)	5d.	£22	—
127. MANSIONS OR HOUSES. (FIFTH CLASS.) "Labourers' Cottages" (Average height of rooms 9ft.)	4½d.	£20	—
128. MORTUARY. Public	7d.	—	—
129. MOUNTAIN RAILWAYS. (See "Railways")	—	—	—
130. MUSEUMS. Public	1s.	—	—
131. OFFICES, for general business purposes, as in London	10d.	—	—
132. PARADES, as for public institutions, workhouses, &c., formed with 4in. of 1½in. metal, 2in. screened gravel, and rolled	—	11s.	1s. per yard super.
133. PARAFFIN TREATMENT OF WOOD FLOORS, as for hospitals, &c.—viz., paraffin in the solid state to be melted and poured over the wood floor, and then forced into pores of the wood with hot irons. The surface to be then well polished by rubbing with a brush	—	8s. 4d.	9d. per yard super.
34. PARTITIONS. WOOD. Complete, including all timbers and laths, plaster, and paper, both sides, &c.	—	£3 15 0	—
135. PAVEMENTS FOR FOOTWAYS laid complete with 3in York self-faced, complete, including flagging	—	£3 18	7s. per yard super.
136. PAVEMENTS. Ditto ditto, with granite concrete slab 2in. thick	—	£3 6	6s. per yard super.
137. PAVING ASPHALTE. Complete as laid in streets in London. Asphalte 2in. thick, laid on 6in. of cement concrete, including all digging, &c.	—	£9 14	17s. 6d. per yard super.
138. PAVING. Ditto ditto. Asphalte 1½in. thick, on 4in. of cement concrete, including all digging, &c.	—	£6 14	12s. per yard super.
139. PAVING CONCRETE. (See "Floors, Concrete")	—	—	—
140. PAVING CONCRETE FOR STABLES. (See "Stable Paving.")	—	—	—
141. PAVING GRANITE SETTS. 8in. by 3in. by 6in. deep, laid complete on 6in. cement concrete, including digging, &c.	—	£6 18	12s. 6d. per yard super.
142. PAVING GRANITE. 4in. cube setts on 6in. cement concrete, including digging, &c.	—	£6 11	10s. per yard super.
143. PAVING, WOOD BLOCK. Red deal blocks 9in. by 3in. by 6in., laid on ½in. of asphalte, which rests on 6in. of lias lime concrete (1 to 5). Blocks spaced ⅜in. apart, and the joints filled in with asphalte	—	£7 15	14s. per yard super.
144. PAVING, Ditto. Creasoted red deal blocks 9in. by 3in. by 6in., laid on 6in. P.C. concrete. The blocks laid with ¼in. between courses and ⅜in. between blocks, and a clear space of 1in. next to the kerbs to allow for expansion. All joints grouted with a mixture of creasote and pitch. Including all digging, &c.	—	£8 6	15s. per yard super.

145. ANALYTICAL TABLE OF AVERAGE COST OF WOOD-BLOCK PAVING PER YARD SUPER., AS DESCRIBED IN PRECEDING ITEM.

P.C. concrete foundations, 6in. thick, including digging and removing surplus.	9in. by 3in. by 6in. creasoted red deal blocks.	Pitch, creasote, and fuel for grouting joints.	Gravel for bedding, jointing, and covering surface.	Labour paving, grouting and covering, watching, &c.	Total cost per yard super.
s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
5 0	7 6	0 9	0 6	1 3	15 0

	Per foot cube.	Per square of 100ft. super.	Per unit.
146. PAVING, WOOD BLOCK, formed with 9in. by 3in. by 6in. Jarrah blocks, with 6in. bed of concrete, and grouted with bitumen or cement and sand	—	£10 5	18s. 6d. per yard super.
147. PIERS, promenade. Length 900ft., width 24ft., including timber head and pavilion	—	—	£15,000 each

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
148. PILING, sheet, as for foot of sea-walls, &c., comprising creosoted fir piles, 12in. by 12in., by 9ft. long, spaced 10ft. apart, and filled in with 12in. by 6in. creosoted sheet piles 6ft. long, secured with 12in. by 6in. front and back waling pieces bolted to piles. Including wrought-iron shoes to piles and driving into shingle and sand in tide work	—	—	30s. per foot run
149. POLICE COURTS	10d.	—	
150. PORCHES, as for theatres, hotels, &c., constructed of glass and iron, complete, 16ft. long	-	—	£80 each
151. POST-OFFICES	8d.	—	—
152. PRISONS	9d.	—	£150 per cell
153. RACE STANDS. Permanent, complete, including usual offices, &c.	—	—	£1 per head of accommodation.
154. RACQUET COURTS	3½d.	—	£1,500 each
155. RAILING, as for public inclosures, parks, cemeteries, &c., comprising dwarf wall, 2ft. high, with foundations, stone coping, &c., wrought-iron ornamental railing, 5ft. 6in. high, with main standards 9ft. apart. Fixed complete	—	—	25s. per foot run
156. RAILINGS, ditto ditto, but with plain wrought-iron railing, and ditto ditto	—	—	£1 per foot run
157. RAILWAYS, permanent, double track, complete as constructed in England, including equipment, 4ft. 8½in. gauge	—	—	£38,000 per mile
158. RAILWAYS. Ditto, ditto, Scotland, 4ft. 8½in. gauge	—	—	£28,000 per mile
159. RAILWAYS. Ditto, ditto, Ireland, 5ft. 3in. gauge	—	—	£16,000 per mile
160. RAILWAYS. Ditto, ditto, India, 3ft. 3⅜in. gauge	—	—	£12,000 per mile
161. RAILWAYS. Ditto, ditto, India, 5ft. 6in. gauge	—	—	£20,000 per mile
162. RAILWAYS. Light, permanent, single track, complete as constructed in England and Ireland, in flat country, including equipment, 2ft. gauge	—	—	£3,000 per mile
163. RAILWAYS. Ditto, ditto, 3ft. gauge	—	—	£4,000 per mile
164. RAILWAYS. Ditto, ditto, 4ft. 8½in. gauge	—	—	£6,000 per mile
165. RAILWAYS. Ditto, ditto, 5ft. 3in. gauge	—	—	£7,000 per mile
166. RAILWAYS. Ditto, ditto, permanent way only, 2ft. gauge	—	—	£1,400 per mile
167. RAILWAYS. Ditto, ditto, ditto, 3ft. gauge	—	—	£1,700 per mile
168. RAILWAYS. Ditto, ditto, ditto, 4ft. 8½in. gauge	—	—	£2,300 per mile
169. RAILWAYS. Ditto, ditto, ditto, 5ft. 3in. gauge	—	—	£2,600 per mile

170. ANALYTICAL TABLE OF AVERAGE COST PER MILE OF PERMANENT WAY FOR SINGLE-LINE LIGHT RAILWAYS.

Description.	Rails, fish-plates, bolts, &c.	Creasoted fir sleepers.	Laying permanent way.	Ballasting.	Fencing, including fixing (both sides).	Forming cuttings, embankments, culverts, &c.	Total. Per Mile.
	£	£	£	£	£	£	£
2ft. 0in. gauge	350	110	120	120	300	400	1,400
3ft. 0in. gauge	480	120	130	130	300	540	1,700
4ft. 8½in. gauge	620	150	150	180	300	900	2,300
5ft. 3in. gauge	660	170	160	210	300	1,100	2,600

	Per foot cube.	Per square of 100ft. super.	Per unit.
171. RAILWAYS. Light, semi-portable single track for temporary engineering purposes, &c., with rolled steel rails and sleepers, bolts, fastenings, &c. Complete for fixing. 1ft. 6in. gauge.	—	—	£300 per mile, or £500 per mile laid complete, but not including equipment.
172. RAILWAYS. Ditto, ditto, 2ft. gauge			£300 per mile, or £500 per mile, laid complete, but not including equipment.
173. RAILWAYS. Ditto, ditto, 2ft. 6in. gauge	—	—	£400 per mile, or £500 per mile, laid complete, but not including equipment.
174. RAILWAYS, MOUNTAIN. Single line, with rack principle, mètre gauge	—	—	£4,500 per mile

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
175. RESERVOIRS. Storage, for waterworks	—	—	Average cost varies from £280 to £700 per million cubic feet, according to the nature of excavations and embankments required.
176. RIDING SCHOOLS, complete	5d.	£55	—
177. ROADS. Formed with 6in. of 3in. broken stone, 2in. of 1½in. metal, and 1in. of gravel, and well rolled	—	£1 2	2s. per yard super.
178. ROADS. Formed with 10in. of stone underlay, 4in. of 3in. broken stone, 2in. of 1½in. metal, 1in. of gravel, and well rolled, including footpaths, curbs, channel, sewer, &c. Width of road, 40ft.	—	—	£2 5s. per foot run
179. ROADS, MAIN. As constructed in mountainous districts in India, average width, 18ft., including embankments, bridges, drains, &c.	—	—	£2,500 per mile
180. ROOFS, IRON. Not exceeding 25ft. span, including wrought-iron trusses, &c., corrugated sheet-iron covering, gutters, &c. (Measured on slope or curve)	—	£6 0 0	—
181. ROOFS. Ditto ditto exceeding 25ft. span, but not exceeding 50ft. span. (Measured on slope or curve)	—	£6 10 0	—
182. ROOFS. Ditto. Not exceeding 25ft. span, including wrought-iron trusses, wood purlins, boarding, slating, leadwork, gutters, &c. (Measured on slope)	—	£7 0 0	—
183. ROOFS. Ditto ditto ditto exceeding 25ft. span, but not exceeding 50ft. span. (Measured on slope)	—	£9 0 0	—
184. ROOFS Ditto ditto ditto exceeding 50ft. span, but not exceeding 100ft. span. (Measured on slope)	—	£15 0 0	—
185. ROOFS. Ditto for spans over 150ft., for railway stations. (Measured on slope)	—	£30 0 0	—
186. ROOFS, THATCHED. For farm buildings, including best wheat straw for thatching 12in. thick, spars, ledgers, spun yarn, &c.)	—	£1 12 0	—
187. ROOFS, WOOD. Collar tie, including roof timbers, boarding, asphalted felt, eaves gutters, &c. (Measured on slope)	—	£3 5 0	—
188. ROOFS. Ditto ditto. Including roof timbers, board-slating, lead-work, eaves gutters, &c. (Measured on slope)	—	£5 0 0	—
189. ROOFS, WOOD. Framed trusses, including slates, 1in. boarding, plates, rafters, purlins, leadwork, eaves gutters, &c. (Measured on slopes)	—	£6 10 0	—
190. ROOFS. Ditto ditto ditto, but including ceiling-joists, lath-and-plaster ceiling, whiten two coats, &c. (Measured on slopes)	—	£8 12 0	—
191. SANATORIUMS, public. (See "Hospitals.")	—	—	—
192. SCHOOLS. Ordinary town or country	6½d.	—	£6 per head
193. SCHOOLS. London School Board	—	—	£10 per head
194. SCHOOL FITMENTS and furniture complete	—	—	10s. per head
195. SCHOOLS, RIDING. (See "Riding Schools.")	—	—	—
196. SEATS. Mahogany, complete, as for billiard-rooms	—	—	37s. per foot run
197. SEWAGE DISPOSAL. Average cost of sewage farm complete, including purchase of land	—	—	30s. per head of populatn, or 9d. in the £ of rateable value
198. SEWAGE FARMS. Average cost of laying-out land, including tanks, drainage, embankments, conduits, distributing chambers, roads, fences, &c., but exclusive of cost of land	—	—	£100 per acre
199. SEWERS, MAIN. Brick and concrete, egg shape in section, internal dimensions 4ft. 6in. by 3ft. Complete, including digging	—	—	15s. per foot run
200. SHEDS, IRON. Open. Roof of iron trusses and corrugated sheet-iron supported on iron columns 12ft. high; concrete floor	—	£15 0 0	—

THE SURVEYORS' INSTITUTION.

THE paper read at the ordinary general meeting of this Institution on Monday evening last dealt, as is usual during the great "Cattle Show week," when many of the country land agent members are in town, with a purely agricultural subject. It was entitled "The Working of the Agricultural Holdings Act, 1883," and in it Mr. T. Punchard, the author, pointed out several defects in the Act, as shown in its working, and suggested some remedies, while also criticising some which had been already proposed. The paper, which was terse and finished in style, was particularly remarkable for the lucidity of its detail and the accuracy with which the author gave references to decided cases. There had been for some time, the author said, a distinct feeling shown among those who were affected by the working of the Act, whether tenant farmers or land agents (as representing landlords), that some amendment of its details was necessary. The Act, to begin with, had merely laid down that the basis of compensation claimed by an outgoing tenant of farm-land should be the value of his unexhausted improvements to the incoming tenant, but had left the ascertainment of such value entirely to the experience of valuers administering such Acts. On the passing of the Act, meetings of tenants and land agents were held with a view to fixing some system on which such valuations could be computed, and as a general result, where a scheme was arrived at, it was based on schemes of tenant right, long in vogue, with material alterations and additions in the elements or items to be compensated for. The Act, in fact, was taken as giving to the tenant farmer simply a more extended and liberal scheme of compensation than that already provided for, and on many large estates the revised scales were incorporated in the tenancy agreements. In a number of cases this had resulted in the settlement of claims without recourse to the machinery of the Act, and on the whole these scales had worked well. An objection of these scales was, however, their want of elasticity, or, as the author put it, their equal application in unequal cases. They did not distinguish between the good, the moderately good, and the bad farmer, and the previous state of the land was not considered. Again, the allowances for feeding stuffs were based too much upon proportions of cost and not upon residual values. But taking proportion of cost, it was possible to arrive tolerably correctly at the cost of the improvement to be compensated for, and it was scarcely fair to charge an incoming tenant any larger sum than that for which he could produce or procure an improvement. At the same time no very reliable standard of residual values, under all the varying circumstances, had yet been set up. In the working of the Act, the procedure clauses had led to most of the litigation which had taken place. Tenants had been, and were still, careless in preparing notices of claim, and inattentive to forms of procedure. Vaguely-worded sections had afforded opportunities for the lawyers. Conflicting decisions in neighbouring courts, and reversals of these decisions by the higher courts, had also led to distrust and confusion. Mr. Punchard then proceeded to give, in a brief summary, the gist of some of the more important decisions under the Act, and to point out their teaching. Landlords, as a rule, had undertaken most of the permanent improvements themselves, and it would be a bad day for agriculture when theoretical legislation discountenanced this. Many sections of the Act had given much trouble to referees and umpires acting under it. Certain matters were mentioned specifically as conferring the right to compensation; but was this compensation equal whether the tenant had previously under agreement a right to do these things, or whether he had no such right? Many curious claims for compensation and counter-claims for deterioration were mentioned, apparently to show that the differing decisions of umpires depended not alone on the varying circumstances of cases, but also to some extent on the umpire himself. The expense of carrying out the provisions of the Act had been to a large extent the cause of its failure in many parts of the country, although it must be admitted that, even where it was not generally carried out, it had not been without influence or bearing upon tenant's compensation. The different methods of umpires in dealing with breaches of covenant had led to much doubt, and the loose way in which claims were frequently drawn up led to many complications. The suggested amendments to the Act were frequently proposed by journals having a strong political bias, and against such the author protested. It was easy to say that "the tenant farmer ought to be made secure of a return for his outlay," and everyone must agree as to the desirability of such a consummation; but how could someone who derived no benefit from such outlay be expected to become security for all the farmer's losses, whether from bad seasons, disease, injudicious expenditure, or unskilful management? If anyone asserted that any amendment of the Act would remedy all this, he must be wilfully or unfortunately blind. Bad times had been (and truly) attributed to foreign competition. Would any amendment of the Act remedy this? If it were plainly put that "the tenant should be entitled to full compensation for such portion of his outlay as the landlord or the incoming tenant reaps the benefit of," there was not a member of the Institution who would dispute the justice of the statement.

A hearty vote of thanks to Mr. Punchard was put by Mr. J. W. Fair and seconded by Mr. G. German, and after short speeches by Mr. C. Sewell Read, Mr. W. B. Canning, Mr. J. Waterman, and Mr. Jasper More, M.P., the discussion was adjourned.

* * *

COUNTY LUNATIC ASYLUMS.—XXXV.

By George H. Bibby, F.R.I.B.A.

DISTRICT ASYLUMS AT HOME AND ABROAD.

THE problem for architects as to the general arrangement of the asylum and the placement of the various buildings upon the asylum estate may possibly be solved eventually by a villa or cottage system, somewhat as developed in the United States; but there are some difficulties in the way of such modes being successfully adopted in this country. There can be no doubt but that the Americans have good reason for claiming that their systems may be more economical and permit of better classification than ours, and that a more home-like appearance may be given to these residences and their surroundings than can be found in English asylums as at present generally planned and designed.

The records of the Hanwell Asylum, of which a block-plan is given in Fig. 53, date from 1831, when it appears to have been capable of accommodating about 500 patients; but since that period the institution appears to have been continually on the increase, for in the year 1841 there were 918 patients; in 1851, 916 patients; in 1861, 1,446 patients; in 1871, 1,797 patients; in 1881 there were 1,840 patients; and in 1891 about 1,895 patients. At the present time the sum of £41,000 has been authorised for expenditure upon a scheme of alterations and improvements. This work will, when commenced, probably extend over three years, and will, it is proposed, be carried out by the Asylum's staff of workmen.

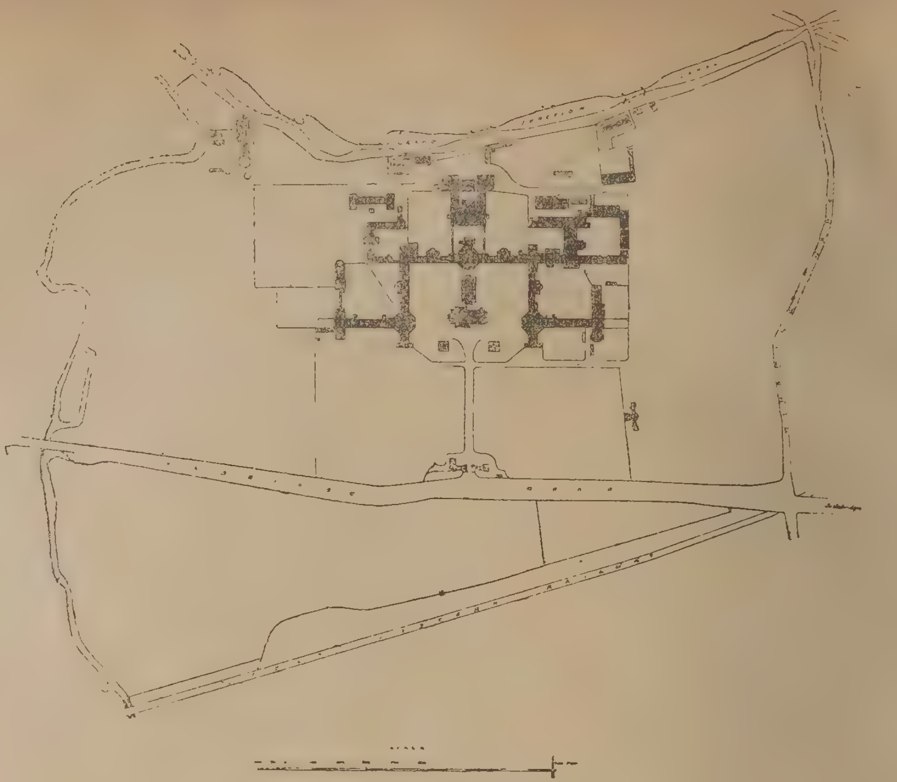

Fig. 53.

These extensions of the asylum buildings in former years appear to have been contrary to the wishes of the Commissioners in Lunacy, and so far back as the year 1858 or 1859 the then commissioners recommended that the fresh expenditure for building should go to the erection, "on some simple and inexpensive plan, of a third asylum."

It is not to be expected that such an asylum as that at Hanwell should compare favourably with modern institutions, either here or abroad, still less that such a set of buildings (erected at different periods) should resemble, in plan or otherwise, an asylum designed for the reception of a similar number of inmates; but it will be observed that the result of the various alterations leaves the general arrangement not altogether unsymmetrical upon the whole.

Another type of asylum, partly a symmetrically planned set of buildings, but with many detached portions, is shown in Fig. 54, which is a block-plan of the Rossiville Asylum for the Insane, in New South Wales, for which Messrs. Sulman and Power, architects, of Sydney, obtained the first premium in competition.

In this plan, the junior medical officers' residences, servants' and matron's quarters were placed to the north of the main buildings at A, thus occupying a central position with regard to the whole group of wards, whether attached to, or detached from, the main buildings. The remaining central portions are: B, the library; C, dispensary; D, billiard-room; E E, recreation-room, with stage and platform; and F, the reception and administration block, containing the medical superintendent's office, entrance-hall, &c. The wards for sick and infirm men are shown at G, and contain the usual day-rooms and dormitories, &c., and water-closet annexes, with isolating passages. The kitchen and stores blocks of buildings are shown at H, and are entirely on the men's side, and approached from the southern side of the institution by a roadway at *a a*, which crosses the verandah, shown by dotted lines.

The block marked J is for male attendants, while the storekeeper's residence is at K, who is thus located near to the stores entrance. The wards for recent and acute male patients are placed at the north-east corner at L, the south-eastern corner block at M being for the medical superintendent's private residence.

On the side for female patients, the wards for the sick and infirm are at N, the plan corresponding

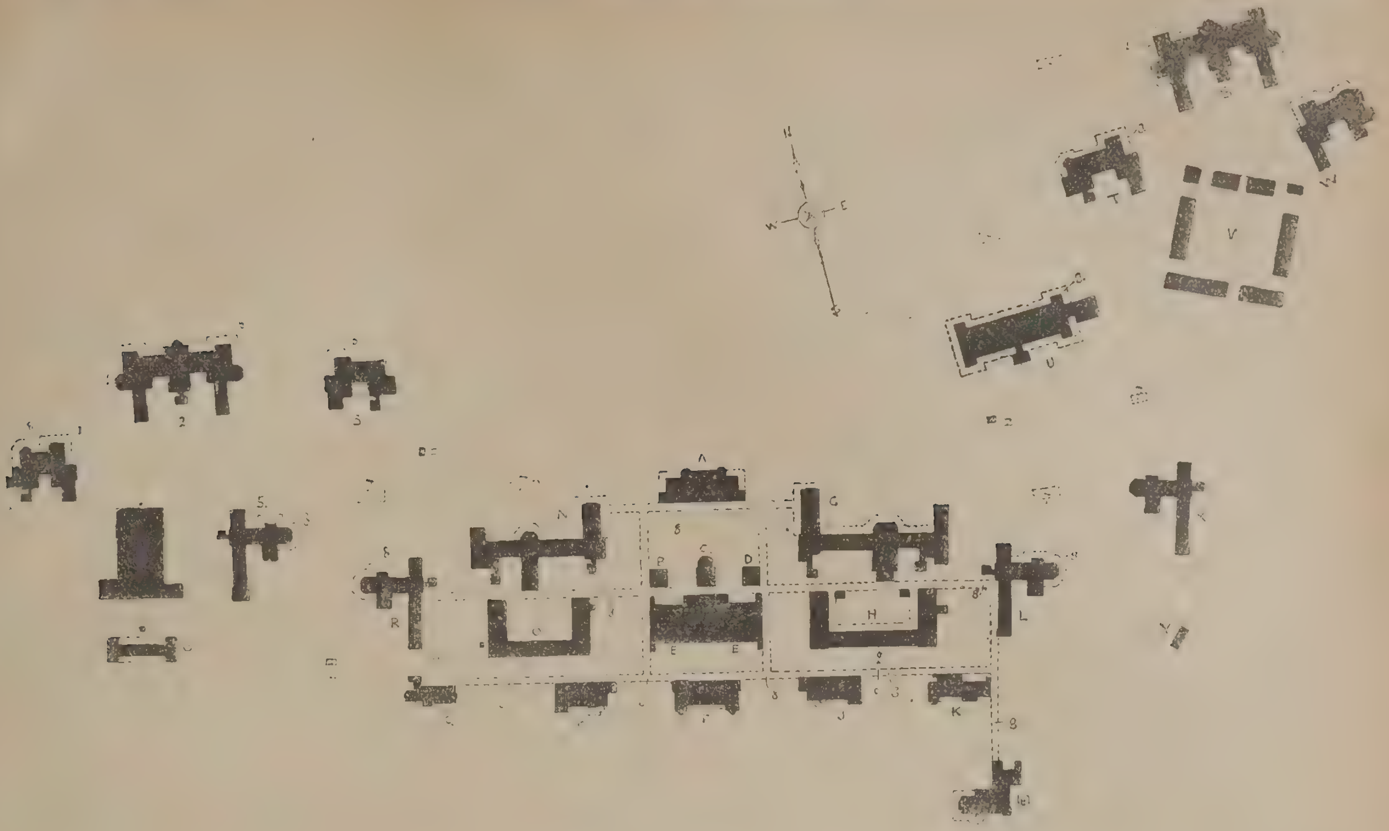

Fig. 54.

generally with that for sick and infirm men, but (contrary to the usual arrangement in this country) for a considerably less number of inmates. The Turkish baths, engine and boiler rooms, and fuel stores are all contained in one block at O, which is approached from the southern side at *b b* by a road crossing the verandah.

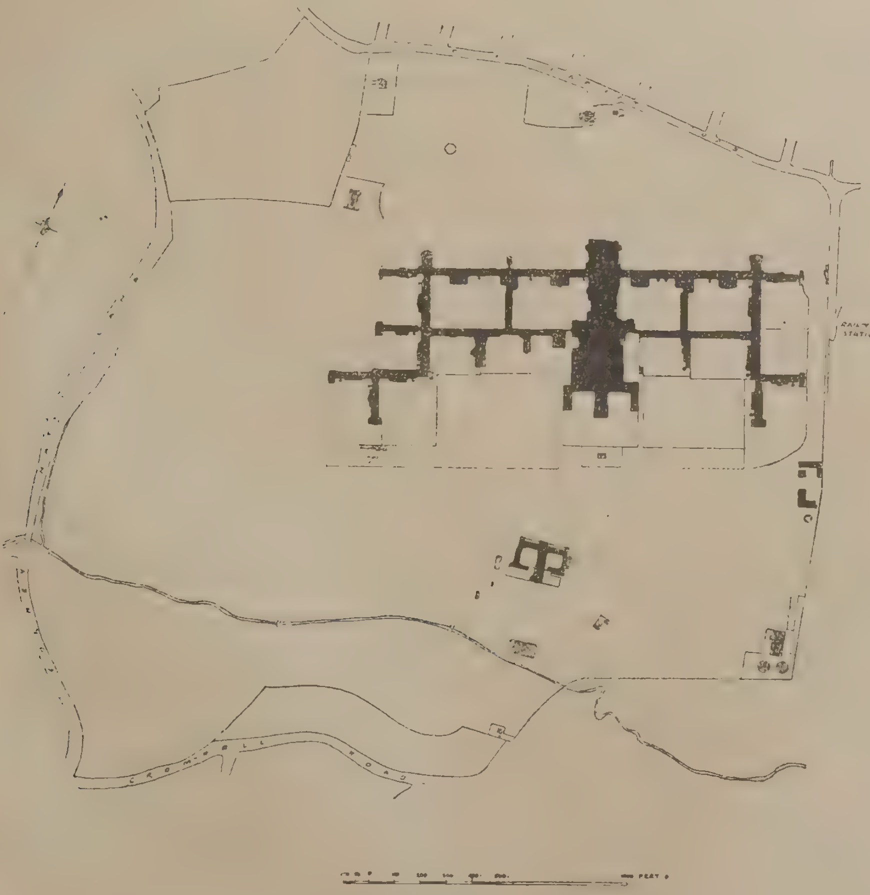

Fig. 55.

The quarters for the female attendants are placed at P, where they are well placed with a view to their privacy, and are quite separated from the patients' and male officials' quarters; the assistant superintendent's house is placed to the south-west at Q, and is somewhat smaller than that for the asylum chief. The wards for the "recent and acute" female patients are shown at R, being the north-eastern corner of the central main buildings.

All the foregoing buildings are connected with each other by the verandahs marked 8, 8, 8, as indicated on the plan by dotted lines, and verandahs are provided for on one or more sides of every inhabited portion of this asylum—an arrangement desirable under the conditions of Australian climate, but less so for English or North American asylums.

The detached blocks of buildings are as follows:—S, quiet and industrious male patients; T, convalescent males; U, epileptic males; V, workshops for males; W, spare block for males; X, violent and noisy male patients; Y, mortuary for males; and the small buildings at Z, Z show the position of the closets, &c., for patients about the grounds.

On the western side of the institution the spare detached ward marked 1 is for females; 2, for quiet and industrious patients; 3, for convalescent females; 4, the laundry, with engine-house, boiler-house, and necessary adjuncts for the officers' and patients' clothes-washing; 5, violent and noisy women; 6, the laundresses' quarters; 7, 7, 7 indicate by dotted lines the position of shelters from the sun or rain for patients allowed about the grounds of the asylum.

The verandahs attached to the various patients' blocks are arranged as lean-to shelters in such a manner as to leave a height of one-third of the ward windows above the verandah roof (see Fig. 27, Building News, March 22, C.L.A. XV.), which space would be available for ventilating purposes. This is as originally planned more than twenty years ago at the Whittingham, Prestwich, and other asylums designed by the late Mr. Henry Littler, who was probably the best asylum architect of his day, and who, upon one occasion, having a very large asylum in progress, provided a staff of architects' assistants, and, with them, temporarily resided on or near to the asylum estate, a desirable arrangement, when practicable, in the case of all institutions of the magnitude of that in question, as has been proved by the high character this asylum yet possesses with regard to its convenient arrangement and sound principles of construction. It would appear most advantageous that all asylums to cost more than, say, £200,000 should be erected under the direction of a resident architect, or of his specially qualified and resident professional deputy.

When, as is occasionally the case, an asylum building is to cost more than £500,000, there should be no financial difficulty in securing the services of a resident or deputy resident architect, seeing that the professional remuneration would not be less than £15,000 at 3 per cent., or £25,000 at 5 per cent., upon the actual outlay.

Amongst the older important asylums must be included the Colney Hatch Asylum, of which a block-plan is given in Fig. 55 (this was established some 20 years later than the Hanwell Asylum, shown in Fig. 53), and was originally constructed to receive about 1,200 patients. In the year 1861 this institution had so far increased that 1,868 patients were accommodated; and at the commencement of the year 1895, the total number of patients had risen to 2,211, or 1,000 more than the original asylum was planned to contain; and, as may be seen from the plan, a symmetrical arrangement of the buildings has been maintained throughout all the alterations and additions made during a period of 45 years.

(*To be continued.*)

COST AND RESULTS OF HOUSING GLASGOW POOR.

AT the last meeting of the Philosophical Society—Dr. Ebenezer Duncan, president, in the chair—Bailie Chisholm read a paper on "The History and Results of the Glasgow City Improvement Trust." The inception of the Glasgow City Improvement Trust was, he explained, partly coincident with and partly consequent on the growth of public sentiment in the direction of sanitary and hygienic reform which had distinguished the second half of the present century. The rapid and marvellous rush of people from the country districts to our great cities during the period remarked upon found their city authorities all but unprepared. In the centre of the city the people came to be crowded together in such a way that the district was a seat of disease and crime, a hotbed of pollution and vice. While officialism left this state of matters unheeded, fortunately private philanthropy stepped in to lessen, if not to remove, a hideous blot from their midst. It was not until 1865 that the Glasgow Corporation moved in the matter, and in the following year the City Improvement Trust Bill was passed into law. The Trust had not only improved the streets by widening them and opening them into squares, but had erected, in addition to dwellings for the poor in different parts of the city, seven lodging-houses, with accommodation for upwards of 2,000 lodgers, and these lodging-houses were a great and unmixed blessing to those who used them, while since their erection the old pestilential lodging-houses had disappeared from their midst. There was also in course of erection a family home or crèche. The building of tenements by the Trust was, in a manner, a last resort. The sites cleared by the Trust were not taken up by builders, and the Trust was thus forced into building itself, and, exclusive of tenements in course of erection, it now owned considerably over 1,000 dwellings, accommodating nearly 6,000 people, at rents varying from £5 to £20 or £25. It was said that they were merely shifting the very poor and the vicious from one part to another. That was not true. In sweeping the breeding sties of vice away they had given health of body and cleanliness of life which previously did not exist, and, if other proprietors would follow it, the social and domestic amenities of their poorest citizens would in a very few years be further improved. The Trust had expended altogether on lands and buildings £1,955,506, and on the erection of buildings £231,000, giving a total of £2,186,506, and, deducting land sold or feued, amounting to £1,072,000, this left a balance of £1,114,506. The heritable property of the Trust was valued at £691,161, showing a deficiency of £423,144. The total cost to the ratepayers during thirty years—that was, the amount obtained by assessment—had been £593,079 16s. 6d., against which they had the Alexandra Park, 100,000 yards of ground thrown into streets and squares, and more than £100,000 expended in covering the Molendinar and Camlachie burns. The charge made against the ratepayers might now be said to have ceased, as the operations were now self-supporting.

THE LANCASHIRE FEDERATION OF BUILDING TRADE EMPLOYERS.

THE half-yearly meeting of this Federation was held at the Devonshire Hotel, Blackburn, on Tuesday, the 3rd inst. The President, Mr. John Fecitt (Blackburn), was in the chair, and there was a good attendance of representatives from Accrington, Blackburn, Bolton, Burnley, Chorley, Colne, Nelson, Oldham, Preston, and Rochdale. The report of the executive committee, which was unanimously adopted, referred to the progress made during the half-year, which was regarded as satisfactory. Two local asssociations, Oldham and Burnley, had joined during that period, and meetings had been held in the Bury and Heywood district, and in Ashton-under-Lyne and Stalybridge. Their secretary (Mr. J. Tomlison, Preston) was in communication with the principal towns in the county not at present affiliated, and no efforts would be spared to form a strong association. The relations between employers and operatives in the federated towns during the last six months were also reviewed, and the committee were able to congratulate members on the benefits employers had already derived from the federation. A recommendation to amend the rules was referred back to the committee for further consideration on the motion of Mr. W. Cunliffe, Bolton. On the motion of Mr. R. Highton, Blackburn, it was resolved to adopt the conditions of contract issued by the National Association of Builders, for use in those towns not having an approved form at present, and, in view of recent judicial decisions with respect to the liability of employers as regards bound apprentices, the secretary was instructed to submit a form of indenture for counsel's opinion, and bring the same before a future meeting for adoption. A uniform system of quantity surveying and treatment of prime cost sums in quantities was thought to be desirable, and the committee were directed to take the matter into consideration, and report to the next meeting what steps it was desirable to take. Notices for changes in wages or alterations in working-rules pending at Accrington, Blackburn, Bolton, Nelson, and Preston were considered; reports were received from representatives respecting the action proposed to be taken as to craneage charges by railway companies, and other matters of trade interest were discussed. A vote of thanks to the chairman, proposed by Mr. S. Smethurst, Oldham, and seconded by Mr. Whittaker, Accrington, was suitably acknowledged.

ALMANACS AND DIARIES.

THE *District and Parish Councillors' Diary* (London: Hazell, Watson, and Viney, Ltd., 3s. 6d.) is a most useful manual. It contains a mass of memoranda for guardians, councillors, overseers, and the like, which is inaccessible elsewhere. The *City Diary* (London: W. and L. Collingridge) is indispensable in its special line. Still more so, as ever, to our own readers are the ever-welcome Date-indicating Pads and Book Diaries of Messrs. Hudson and Kearns. One's only complaint against them is that they so facilitate the too rapid flight of time, and yet what we busy people did without them twenty years since it is difficult to imagine. Every architect and builder now finds them as indispensable as the tee-square and drawing-board, and it is scarcely necessary to do more than remind those who have not already sent their order to 83, Southwark-street, that but a few more days remain—nay, that already engagements and dates for 1896 are crowding on us that imperatively demand registering.

BOOKS RECEIVED.

Rustic Adornments, for Homes of Taste, by SHIRLEY HIBBERD (new edition; London: W. H. and L. Collingridge).—This new edition, revised by T. W. Sanders, F.R.H.S., is pictorially got up with folial borders, coloured in green and gold, and illustrated by floral decorations, fern-cases, conservatories, balcony and window gardens, aquaria, rockeries, fountains, garden accessories, and page illustrations of plants. The suggestions for floral embellishment of the home, the garden, the window, and balcony are instructive, and will be worth the attention of all amateur gardeners. This edition contains several new chapters in which will be found hints for the floral decorations of interiors, tables, plant propagation. The style of Mr. Shirley Hibberd—always pleasing—has been retained as far as possible, and the new illustrations are numerous. Altogether, the volume, which is handsomely bound and well printed, will be a welcome addition to the presentable Christmas gift books.——*Saker's Perfected System of Builders' Bookkeeping*, by SYDNEY SAKER, F.S.A.A. (London: Simpkin, Marshall, Hamilton, Kent, and Co.)—Builders' bookkeeping is often very unsatisfactory, and, as the author observes, "no trader's books are kept in so dilatory and unsatisfactory a manner as those of the majority of builders." There is no proper system adopted by which they can tell the profits they make. Mr. Saker's system is by double entry, and is the result of practical experience as an accountant. In this second edition some alterations have been made, not the least being the omission of the single-entry portion, which is regarded as unsatisfactory. The examples given of "time," "day-work," "contracts," "cash-book," "debtor's account-book," "bills book," "invoice book," &c., will be found very explanatory and useful of the system, and the author has prepared pattern sets of ruled sheets, which may be obtained of Mr. J. W. Warner, the publisher, Melton Mowbray. We strongly advise all builders and builders' accountants to study this little work, which gives simple directions and examples of the principal books and subsidiary books required. Many builders lose by not keeping a proper contract book in which an account is opened for every contract, the amount of wages from time-book, materials from invoice-book, and so on, and by not opening a separate account in a day-work book for each customer, and for extras on contracts. The examples show how these entries are to be made.

CHIPS.

A meeting was held on Friday at Sion College, Victoria Embankment, to receive from a large number of subscribers the gift of a portrait of the librarian, the Rev. W. H. Milman. The portrait has been painted by Mr. W. B. Richmond, R.A.

Last week was not a very successful one at the Auction Mart. The aggregate of £76,254 was largely made up of sales of gas stocks, life policies, reversions, &c.

The name of Frederick Stephen Short, of Parkstone, Dorset, architect and surveyor, appears in Tuesday's *Gazette* in the list of adjudications in bankruptcy.

The guardians of Hunslet Union, near Leeds, have adopted plans by Mr. Edward J. Dodgson, of East-parade, Leeds, for the erection of a group of children's homes at Rothwell Haigh.

Mr. Douglas, of New York, has presented to the Woodwardian Museum of Cambridge a portrait of the late Professor Thomas Sterry Hunt, upon whom the honorary degree of LL D. was conferred in 1831 in recognition of his work in chemical geology.

In the case of Charles Philip Mills, of St. Mary's Works, Barn-street, Church-street, Stoke Newington, N., builder, the discharge has been suspended for two years, ending Nov. 1, 1897.

The tiles for the chancel pavement of St. Thomas' Cathedral, Colombo, are being supplied by Messrs. William Godwin and Son, Lugwardine Works, Withington, Hereford.

The directors of the Great Western Railway have decided to build a new station at Windsor, and to rearrange the goods terminus, in order to provide increased accommodation for the traffic.

In connection with the rebuilding and extension of the schools connected with the Roman Catholic Pro-Cathedral, Copperas-hill, Liverpool, to the plans of Messrs. T. C. Clarke, Briggs, and Wolstenholme, architects, Liverpool, the contract for heating, lighting, and ventilating, has just been let to Messrs. James Stott and Co., 83, Dale-street, Liverpool, and Vernon Works, Oldham.

At the Town-hall, Leeds, on Monday, damages were assessed by the under-sheriff and a jury in a number of claims made against the Morecambe Pier Company, Limited, as a consequence of the landing-stage of the pier collapsing on September 9. Negligence was practically admitted on behalf of the directors, on whose behalf it was stated that the company was insolvent. The amounts awarded varied from £150 downwards.

A meeting of the Registration Committee of the District Council for Liverpool, West Lancashire, Cheshire, and North Wales (in connection with the Worshipful Company of Plumbers, London), was held at the secretary's office, Lord-street, Liverpool, on Monday. The secretary reported that an examination would be held next May of candidates now in attendance at the various plumbers' classes. The resignation by Mr. H. Percy Boulnois of the honorary treasurership, owing to increase of official duties, was accepted with great regret, and a resolution was passed acknowledging his valuable services. Mr. Coard S. Pain, of 14, North John-street, was appointed hononary treasurer in place of Mr. Boulnois.

Delegates from Metropolitan local authorities assembled at the Kensington Town Hall on Tuesday, and discussed the question of the Metropolitan water supply. A motion in favour of creating a water trust, with power to purchase the water companies' interests and control the supply, was adopted.

FIRST PREMIATED DESIGN FOR THE NEW SHOREDITCH FREE LIBRARY AND BATHS.—LABOURERS' DWELLINGS, OLDHAM ROAD, MANCHESTER.—SKETCHES FROM ROCHESTER CATHEDRAL.—ST. MICHAEL'S CHURCH, BEGUILDY.—VILLAS AT EAST GRINSTEAD.—OLD CHURCHYARD CROSS AT BAKEWELL.—HONG KONG GOLF CLUB.—HALL AT NO. XLV. KENSINGTON-SQUARE.

Our Illustrations.

SHOREDITCH PUBLIC BATHS AND WASHHOUSES AND (PASSMORE EDWARDS) PUBLIC LIBRARY FIRST PREMIATED DESIGN.

We give the view, plans, and elevation of this design by Mr. H. T. Hare, placed first by the referee Mr. Rowland Plumbe. It is useless to ignore the fact that there is a very general, and we think natural, expression of disappointment with the choice which has been made. The conditions laid down definite provisions, leaving no room for doubt as to their intention, such as the stipulation that the first-class bath should comply with the requirements of the London County Council for use as a public hall. Mr. Hare's plan provides only one staircase from the gallery, and that is so contrived as to bring the gallery audience immediately down into the main corridor already crowded with the ground-floor people. The two other narrow staircases behind the spring-board of the bath pitch together, and are quite unsuited for emergency stairs. The position of the bath itself as a public hall is, in fact, a mistaken one. It ought to have abutted on to Bowling Green-walk. The library plan is also open to serious objection; as, for, instance the book-store, instead of being of ready access in the basement is isolated on the first floor, where it is quite out of place. Such initial failings as these can surely hardly have escaped the referee's notice? We shall illustrate other designs shortly.

CITY OF MANCHESTER LABOURERS' DWELLINGS, OLDHAM ROAD.

The site on which these buildings stand contains a superficial area of 7,832 square yards, of which about 3,430 yards are covered by the buildings, all of which have frontages to the main streets. The large open central quadrangle, containing a superficial area of 4,402 yards, obtained by this arrangement of plan, is reserved for that most necessary adjunct to buildings of this class—viz., a spacious recreation-ground, which is inclosed and separated from the cartway and footway by means of a light iron fence. The whole of the ground-floor of the building fronting Oldham-road is reserved for shops. These are so planned as to be available either for the occupation of tenants residing in the dwellings, or for those who, by residing elsewhere, would merely utilise them as "lock-up" shops. The large double-fronted shops at the corner of each of the other façades not only serve to break the unavoidably monotonous effect of the long frontages, but, from their proximity to the public entrances and staircases, they cannot fail to add to the comfort and convenience of the occupants of the dwellings. In all cases good cellarage accommodation has been provided for use in connection with the shops. The public staircases, which are of good width and in straight flights without winders, are immediately accessible from the street entrances, and they afford direct communication both with the external corridors and with the laundry department on the attic floor. They are all amply lighted and ventilated, both by windows placed at the level of each floor and by means of large top skylights. The superintendent's office and rooms immediately adjoin the cartway entrance fronting Spittal-street, in order that this official may have full control and command of the vehicular traffic connected with the dwellings. The average-sized room provided for a one-roomed tenement contains 130sq.ft. and 1,170c.ft. For the two-roomed tenements, one room containing about 174sq.ft. and 1,566c.ft., and one room containing about 108sq.ft. and 972c.ft. are provided. The height of all rooms is 9ft. Each tenement is provided with a well-ventilated food store and a spacious coal store. The sanitary arrangements have received careful consideration. The w.c.'s and sinks are externally placed against outside walls, one pedestal closet, serving also as a slop-sink, and one washing-up sink being provided in the entrance lobbies for the joint use of the occupants of each of the two tenements to which these common lobbies give access. Dust-shoots, with branch junctions having separate check-valves and iron doors, are provided in convenient positions in the main back wall. The flushing tanks, &c., and other details of the sanitary arrangements adopted, are fully in accordance with the latest requirements of the Local Government Board. The laundries, well lighted and ventilated, are placed in the attic floors. They are conveniently accessible from the public staircases, and connected with them are spacious drying-rooms. The walls generally are constructed and faced with local "commons" bricks, with red terracotta and moulded brick strings, sills, and salt-glazed brick dadoes, &c. The façade to the Oldham-road is treated in a rather more ornate manner, being faced with local red stock bricks, whilst terracotta and other ornamentation has been more freely introduced. All floors and staircases are of fireproof construcstruction, finished either with solid deal blocks, tongued boarding, or cemented face. The roofs throughout are slated with the best Bangor slates. The walls of all rooms are finished in plaster. The shops are glazed with plate-glass, and elsewhere strong sheet-glass is used. The schedule of accommodation comprises 16 cellars, 16 shops, 4 laundries with drying-rooms, 237 double tenements, 48 single tenements. The double tenements are for families of four or five persons; the single tenements are for one person. Messrs. Spalding and Cross were the architects for these dwellings, which have been built by Messrs. Wm. Southern and Sons, whose contract amounted to £45,270. Messrs. Spalding and Cross were also the architects to another block of labourers' dwellings built in Pollard-street, and the Manchester Corporation are about to erect a third block of these model dwellings under the same architects.

SKETCHES FROM ROCHESTER CATHEDRAL.—NATIONAL BRONZE MEDAL DRAWINGS.

This plate, reproduced from Mr. Reginald J. Beale's prize drawings, represents two studies of interior stonework from Rochester Cathedral, and about which little need be here said, as the well-known subjects thus depicted demand but a line to introduce them. We gave the remainder of Mr. Beale's sketches selected from the South Kensington Museum Exhibition, held during the summer, in the Building News for Nov. 1st last. The subject was the pulpit in St. Helen's Church at Cliffe, Kent.

ST. MICHAEL'S CHURCH, BEGUILDY, RADNORSHIRE.

Church life and Church work in Wales, despite the carping criticisms and attacks of those politically and sectarianly opposed to it, are not in any way approaching a languishing or moribund condition, as can be readily proved by any one passing through the Principality, and carrying with them an observant eye and an inquiring mind. Church restoration has been, and is being, extensively carried out in a quiet and persistent manner, and the restoration, or rather reconstruction, of the above edifice is only another exemplification of this fact. The old structure, which through lapse of time and accompanying decay has had to be recently taken in hand, is one that undoubtedly was erected several centuries ago on the site of a still more older building. It was about the eighth century that it became usual to dedicate churches to "St. Michael the Archangel," and there were 45 churches so dedicated about this period in the diocese of St. David's. Archdeacon Bevan writes, in his History of the Diocese: "To what cause this popularity is to be attributed we are not aware;—whether it was from the association of St. Michael with hills, or whether there was something that appealed to Welsh sentiment in the significance of this dedication as symbolic of the Church's victorious progress, the dedication seems at all events to be thoroughly characteristic of the Welsh as distinct from the Norman or English elements in our Church history." St. Michael's near the Shepherd's House, or Llanfrangel-y-Beguildy, is undoubtedly one of those placed about the year 790 A.D. among the Beacon Hills, in the very north-east angle of the county of Radnor, and in the upper valley of the river Teme. The church, which is now undergoing restoration, would be built towards the end of the 12th century, as about A.D. 1250, we find that Richard de Carae assigned it, with other churches, to the residentiary canons of St. David's. The Welsh language ceased to be used in the services of this church about 1730. In 1797 it was "restored," after the fashion current in those days—being disfigured, and the fine old oak roof hidden by a flat ceiling, and large square-headed windows inserted in the south side, with a gallery, &c., at the west end. During the last incumbent's time the chancel, which had fallen greatly into decay, was re-erected by the Ecclesiastical Commissioners, under the direction of the late Mr. Ewan Christian, their then professional adviser, and the remainder of the structure, embracing the nave and tower, is now taken in hand by the present vicar, the Rev. Pughe-Morgan, who has called in to assist him Mr. W. R. Bryden, F.R.I.B.A., of Buxton, Derbyshire, the builder being Mr. Thos. Bowen, of Bridgenorth. The anticipated outlay is about £2,600. The old oak roof, and a very fine old oak rood-screen, as well as all other existing memorials and relics of the older churches, are being carefully preserved and reintroduced in the new building.

TWO HOUSES AT EAST GRINSTEAD.

These two houses were recently erected at East Grinstead at the cost of about £1,100, from the designs of Messrs. J. D. and H. E. Mathews, architects, by Mr. E. Steer, builder. The fronts of the houses command extensive views over Ashdown Forest; but the land upon which the buildings were erected was of not sufficient width to allow double-fronted houses. The object aimed at in the planning has been to give these views to the dining and drawing rooms, which in the latter is obtained by the ingle-nook bay.

NEW CLUB HOUSE FOR THE HONG KONG GOLF CLUB.

This building is now being erected in the Wong-nei-Cheong Valley, Hong Kong, and is to take the place of a mat-shed, which has hitherto been sufficient for the wants of the Hong Kong Golf Club. The walling is of coursed rubble, with fine-punched mouldings and dressings. The roof is to be covered with a double cover of Canton pan and roll tiles. Mr. Edward A. Ram is the architect, and the work is being executed by Mr. Sun Shing, contractor, of Hong Kong.

XLV. KENSINGTON SQUARE.

The work to this house, one of the oldest in Kensington, consists of considerable alterations. For 100 years it was the house of successive Drs. Merriman, and before that it is said to have been the town house of Lord Montgomery, and in the days when Kensington Palace was in its prime saw many a revel. It does not contain a powder-room nor secret chamber, as many in the square do. Thackeray lived next door in Young-street. An effort has been made to harmonise the new with the old work. The panelling and fittings of the hall illustrated are throughout of fumigated oak, and the fireplace is treated with old Dutch tiles, with a hammered brass copper frieze, and the effect of age has been obtained. A curious drain plan found with the deeds bears the autograph of William Hardwicke. The architect is Mr. J. D. Butler, F.R.I.B.A., of Redcliffe-gardens, S.W.

Building Intelligence.

Barnet.—The dedication service of the new carved-oak seats, tower-screen, and font canopy took place last week. The additions have been designed by Mr. J. C. Traylen, architect, of Stamford, and executed by Messrs. Harry Hems and Sons, of Exeter. The canopy to font is of spiral outline, and is 10ft. 5in. high; when resting on the font, the dove forming the finial will stand 14ft. 9in. above the floor. The base of the cover is 2ft. 10in. in diameter, and 9ft. 1in. in circumference. Round the base of the cover there is a carved cresting, and just above, at each of the eight angles of the octagon, are canopied and crocketed niches, carved out of the solid oak. Each niche is occupied by a statuette sculptured in the round. The lower panels and upright mullions of the tower-screen, which is 12ft. in width and 10ft. in height, are taken from a 15th-century example in the parish church of Nassington, Northamptonshire.

Birmingham.—The new Municipal Technical School in Suffolk-street, erected from the designs of Messrs. Essex, Nichol, and Goodman, of Birmingham, will be opened to-day (Friday) by the Duke of Devonshire. The total cost, including land, has been just under £89,000. The building is of red brick and buff terracotta in the English Renaissance style, with bold gables, deep, mullioned windows, and sculptured figures and groups in panels. The principal panel of the Suffolk-street façade represents an ancient school of alchemists, with the professor in the midst of his pupils. The iron and steel industries are symbolized in another panel, whilst chemistry, astronomy, and physics are illustrated in a third. A continuous projecting gallery or balcony with iron railings is carried all round the upper story of the exterior on the backs of griffins. The structure occupies an area of 3,000 yards, and contains in all 134 rooms, of which 116 are devoted to teaching. In the basement are the engine-rooms, containing three engines for generating electricity for lighting and motive power and for driving the ventilating-fans. The heating apparatus is also in the basement. The iron and steel shop is fitted with furnaces and muffles for instruction in these branches of manufacture. In a detached building in the courtyard is the wood-pattern room. The brass and metal shops have a frontage of 120ft. The mechanical laboratory contains testing machines and other mechanical appliances, and adjoining it are the lecture and preparation rooms. In the front portion of the building is the laboratory for electro-metallurgy and bronzing, 100ft. long by 43ft. in width, the practical lecture-room, preparation, battery, and dynamo rooms, and in the east wing are the carpenter's shop and a suite of rooms connected with the metallurgical department. There are rooms devoted to physics and chemistry and applied physics. The second floor is devoted to women's classrooms and the geometry rooms. The back wing contains the chemistry department. From the ceiling of each of the large rooms are suspended large arc lamps, under which, hidden from view, are inverted cones. By this means the light is thrown upon the ceiling, and the rooms are lighted by reflection from the white ceilings. On the left of the main entrance are the administrative rooms, and the rooms above are reached by a wide staircase, provided with a wrought-iron handrail. The examination and assembly-room is on the ground floor; the dado is of glazed bricks, and above, the walls are ornamented by works in terracotta. Spaces have been left overhead to be filled hereafter with paintings by Birmingham students.

Brackley, Northants.—The plans prepared by Mr. Thos. Garratt, A.R.I.B.A., of Shepherd's Bush, London, for the new wing of Magdalen College School—including lavatory, sanatorium, dormitory, master's rooms, &c.—have been approved by the authorities of Magdalen College, Oxford, who have accepted Mr. Benfield's tender for its erection. The work is to be put in hand at once. It will not only be a welcome and useful addition to the school buildings, but greatly improve the High-street of the ancient and interesting town.

Colebrooke.—The parish church of Colebrooke, near Yeoford Junction, was reopened last week after the completion of another section of the work of restoration. In 1879 the Ecclesiastical Commissioners restored the chancel, mainly rebuilding it. In 1887 the five bells, then in the tower were rehung, and a new tenor added. Last year a new belfry door and window in the west tower, were put in, Messrs. Tait and Harvev, of Exeter, being the architects, and Messrs. W. Dart and Son, of Crediton, the contractors. The section of the restoration now finished comprises reseating and the removal of the modern west gallery. Although much of the seating consisted of high deal pews, there were many remains of the old 15th-century oak seats, with richly-carved bench ends. These have been repaired and restored, and all the old oak not decayed has been utilised. The rest of the seating is constructed of English oak, and designed in keeping with the old work, but without carving. The 15th-century carved oak prayer-desk has been repaired, and will be again used as a priest's desk. The contractors and architects have been, again, Messrs. Dart and Son and Tait and Harvey. A chiming apparatus has been affixed in the belfry by Mr. H. Stokes, of Woodbury. The cost incurred has been about £450.

Edinburgh. — The existing boiler - house chimney at the Royal Infirmary, being too small for its work, the managers decided to replace it by a larger and loftier one, which is now nearly completed. The new chimney is of red brick, with red stone mouldings and cornices. It is 173ft. high, and measures 16ft. in diameter at the base and 7ft. in diameter at the top. It is circular in plan, and is perfectly plain for 108ft., but at that distance from the ground is an arcaded band in brickwork 6ft. high. This arcade is crowned with a projecting moulded band of stone. The shaft is again plain for another 30ft. At this point the plan is changed from a circle to an octagon by means of stone corbelling. Immediately above this is an overhanging stone band 5ft. high. The band consists of deep brackets connected together by arched and finished on the top with a battlemented parapet, with stone balls at the angles of the octagon. Above this there is another shallow band of plain brickwork, and then a stone band, ornamented on alternate faces with semicircular pediments. Above this are arched recesses, 10ft. high, with brick pilasters. The arches are of stone, and are crowned with triangular pediments. Over these pediments comes the deep stone cornice with which the chimney ends. An addition has also been made to the boiler-house. The architects are Messrs. Sydney Mitchell and Wilson, 13, Young-street, Edinburgh, and the contractors are Messrs. Bruce and Sons, Greenside. Messrs. Sydney Mitchell and Wilson have also prepared plans, which have been approved by the Royal Infirmary committee, for an extension of the buildings by the addition of three large pavilions and one smaller one and a laundry, at an estimated cost of £100,000. About half the scheme will be carried out forthwith.

Molash, Kent.—The parish church has been restored and reopened for service. The edifice dates from the 14th century, and consists of a nave and chancel, with no aisles, and a western tower, with a priest's chamber, 11ft. 6in. by 7ft. 3in., on the north side of the tower. This room is lit by a single cusped window in the head, while the original fireplace remains. The original oak entrance door remains on the south side, and a 13th-century font. The church is built of flint rubble, with stone quoins, and a certain amount of brickwork in the later repairs to the building. The church, which, with the exception of part of the chancel, was in a state of extreme neglect and dilapidation, has been restored under the superintendence of Mr. Reginald T. Blomfield, M.A., F.R.I.B.A. The work has been carried out by Messrs. Wise, of Deal. The roofs, which were in danger of falling in, have been repaired and strengthened; the buttresses, some of which were ruinous, have been rebuilt, and the entire church refloored. The old floor of the church lay below the level of the churchyard, so that the interior was always damp. The outside earth has been excavated, and a dry drain formed all round the building. New seats have been provided for the chancel, and a new pulpit, formed from the remains of the old one, which dated from the 17th century. An oak fence has been placed round the churchyard, the work being executed by Mr. J. Goode. The amount of the expenditure was £700.

Rangemore.—The new chancel of Rangemore Church was consecrated on Saturday by the Bishop of Lichfield. The edifice was built twenty-eight years ago from the designs of Mr. William Butterfield, and consisted of nave and chancel. In 1884 Lord Burton added an aisle on the south side in memory of his father, the founder of the church, stained-glass windows also being inserted by the tenantry and villagers. The old chancel has now been replaced by a longer and loftier one, in 14th-century style, the work being strictly English in character. The walls externally are of Coxbench stone, with Hollington stone dressings, and the interior is of fine white Hollington stone. The chief feature in the design of the chancel is that the altar is placed in a deep recess, which has a stone-vaulted roof, supported by ribs carved and moulded, and there are two stone-carved figures of St. Augustine and St. Aidan placed at a considerable elevation north and south of the altar. The windows are filled with stained glass bearing figures of saints. The floor is of black and white marble, varied in design, with solid black marble steps, some of the patterns being copied from the church of St. Anastasia at Verona. The reredos is of alabaster, and reaches to the sill of the east window. It consists of three panels. In the centre is represented the Crucifixion, with St. Mary and St. John on either side, while in each of the two smaller panels stands the figure of a bishop under a carved canopy. The whole is surrounded by a carved border of grapes and foliage. The choir stalls are carved in oak. The vestry has also been enlarged and refitted in oak. Hopton Wood stone has replaced the Minton tiles in the nave; while a new oak pulpit, with panelling at the back and extensive carving, and steps and base of Purbeck marble, has been introduced. The outlay involved by the alterations is about £4,000, and has been entirely defrayed by Lord Burton. The work, which produces the most artistic effect, was designed by and carried out under the superintendence of Mr. Bodley, A.R.A., and the chief contractors were Messrs. Rudd and Son, of Grantham, Mr. Bridgman, of Lichfield, being responsible for the carved oak work for the ceiling and the stone figures, and Mr. Hodges (Burton) for the nave floor.

St. Helen's.—The new abattoir erected in Foundry-street by the corporation for the use of the butchers of the town was formally inspected by the members of the corporation last week. The buildings are intended to replace the present premises in Cansfield and Frederick streets, which are inconvenient and unsuitable. The new abattoir has been erected at a cost of £4,000, by Mr. Joseph Ellison, builder and contractor, Boundary-road, from plans and specifications prepared by Mr. G. J. C. Broom, M.I.C.E., the borough surveyor, and has been fitted up with all modern appliances. The main buildings are three in number, including lairages providing accommodation for 90 head of cattle and 120 sheep. The cattle slaughter-house is 89ft. by 20ft., and allows for the slaughtering of ten beasts at a time. The storage-house has an area of 2,250sq.ft., being 84ft. by 30ft., with an average height of 21ft., and is capable of storing 340 beasts and 180 sheep and pigs. A siding connected with the London and North-Western Railway runs into the yard, so that cattle can be unloaded direct into the lairages.

Swindon.—The Swindon School Board have just completed extensive additions to the mixed school and infant school at Even Swindon, comprising three new blocks added to the mixed school, containing four classrooms 25ft. by 25ft. each, cloakroom accommodation and entrances, corridors, and the formation of an assembly hall in the old portion of the schools 45ft. by 31ft. The local red bricks have been used, with Bath stone dressings, and the roofs are covered with blue slates. The floors are laid with wood blocks to the schoolrooms, and Woolliscroft's tiles for the entrances and cloakrooms. The additions to the infant school comprise two new classrooms, cloakrooms and entrance, &c., the class of work being similar to that at the mixed school. The estimate of Mr. Thomas Colborne, of Swindon, was accepted at £3,508. Mr. William Drew, M.S.A., of Swindon, was the architect, and Mr. Jas. Elsdon acted as clerk of works.

◆

A stained-glass window, to the memory of the Rev. William Mangles Schnibben, for 13 years vicar of Christ Church, Penrith, has been erected in the south side of that building. The window shows Christ Blessing Children and as the Good Shepherd.

A committee of investigation has discovered numerous defects and weaknesses in the partially completed city hall at St. Louis, Missouri, which has already cost the city over £500,000 sterling, and which will have to be largely reconstructed.

OBITUARY.

We may add to our notice of the late Mr. Charles Thomas Lucas, the senior partner of the well-known contracting firms of Lucas Brothers, Lucas and Aird, and John Aird and Sons, whose death was briefly announced last week, some additional particulars since to hand. Mr. Lucas, who was born in 1820, began business on his own account at Norwich as a builder and contractor. Afterwards he was joined by his brother—now Sir Thomas Lucas—and founded the firm of Lucas Brothers, having large building works at Lowestoft. The business was eventually removed to London, and grew into the three concerns already mentioned. Mr. John Aird, M.P., joined as a partner in 1874. The three undertakings were really one firm, but the names were kept distinct, as each represented a different branch of work and required a separate staff of management. Amongst the more important works carried out by the firms were the construction of the Albert Hall, the South Kensington Exhibition of 1871, the G.E.R. Terminus, Liverpool-street, the Royal Albert Docks, the Metropolitan District Railway and extensions of it, the Hull and Barnsley Railway, the Chatham and Dover Railway, Blackfriars Bridge, Tilbury Docks, and the West Highland Railway. The firms also began the construction of the railway for the Government from Suakin to Berber in the Soudan, which was not completed. Mr. Lucas has left three surviving sons.

Calvert Vaux, a well-known landscape architect, died in Brooklyn, N.Y., on November 21st. He was born in London, December 20, 1824, and was educated at the Merchant Taylors' School, afterward studying architecture under the late Lewis N. Cottingham. At the suggestion of Andrew J. Downing, he emigrated to the United States in 1848, became Mr. Downing's partner, and was engaged with him in landscape gardening and architecture, the firm having laid out the ground surrounding the Capitol and the Smithsonian Institution at Washington. Afterwards Mr. Vaux became associated with Frederick Law Olmsted, and with him prepared a plan for the laying out of Central Park in New York, their design having been accepted after competitive examination, which had been suggested by Mr. Vaux. During the work upon Central Park Mr. Vaux was the consulting landscape architect of the Department of Public Parks. His reputation as a landscape architect was then firmly established, and when Prospect Park was laid out in Brooklyn, in 1865, it was after designs made by his firm. Subsequent to this the firm designed the public parks at Chicago and Buffalo, and the State Reservation at Niagara Falls. Mr. Vaux was afterward appointed landscape architect in the Parks Department in New York city, and with Mr. Olmsted prepared the plans for Riverside and Morningside Parks, as well as for the many small parks which were authorised by the Legislature, and are now in process of preparation. He was the best-known landscape architect in the United States, and was consulted as an expert in matters of that kind by architects all over the country. In addition to his landscape work, Mr. Vaux designed many country residences in Newport and elsewhere, as well as public buildings in New York, the Belvedere, the greystone tower which stands at the lower end of the reservoir in Central Park, being a specimen of his work. He also published an architectural book entitled "Villas and Cottages."

The death is announced of the Rev. Richard St. John Tyrwhitt, formerly senior student and tutor of Christ Church, Oxford, and rector of St. Mary Magdalene, Oxford, from 1858 to 1872. He was well known as a writer on art. His works included "A Handbook of Pictorial Art," "Christian Art and Symbolism," "Greek and Gothic: Historic Essays on the Three Arts," "Art Teaching of the Primitive Church," "Our Sketching Club," "An Amateur Art Book," and other works. He was a contributor to Smith's "Dictionary of Christian Antiquities." Mr. Tyrwhitt was also known as a water-colour painter, and exhibited pictures at the Royal Academy, the Grosvenor Gallery, and other exhibitions.

* * *

The estate of the late Mr. P. H. Rathbone, of Liverpool, has been sworn at £105,595. Mr. Rathbone has bequeathed eight pictures to the Corporation of Liverpool. They are all large and important works, and were considered by Mr. Rathbone to be the most valuable in his collection.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Master Builders' Association.—The annual meeting of this association was held at the Grand Hotel, Birmingham, on Friday evening. Mr. T. Barnsley presided, and there were also present Messrs. J. Bowen, R. Bulley, G. Squires, G. Twigg, B. Whitehouse, T. G. Whitall, G. Raby, J. Barnsley, A. Smith, T. Johnson, W. E. Lee, W. S. Edwards, E. J. Bigwood (secretary), &c. The report of the committee stated that the amicable relations of last year existing between employers and employed had remained undisturbed. The number of members of the association was sixty-seven, being a slight increase on last year. The balance sheet showed that the total receipts for the year had been £119 11s. 3d., which, with the balance from last year (£64 11s. 8d.), made a total of £184 2s. 11d., and the various disbursements £87 11s. 5d., leaving £96 11s. 6d. to the credit of the association. The chairman moved the adoption of the report, and said that if wages had been high, prices had not been high. Mr. R. Bulley seconded the motion, and it was passed. On the proposition of the chairman, seconded by Mr. Whitehouse, Mr. Bulley was elected president for the ensuing year. The other officers appointed were: Vice-president, Mr. B. Whitehouse; treasurer, Mr. G. Twigg; auditors, Messrs. J. S. Surman and T. Johnson; and secretary, Mr. E. J. Bigwood; with a large committee. In the evening the members dined together at the Grand Hotel. Mr. R. Bulley (president) occupied the chair; and amongst those present were Messrs. E. Parkes, M.P., T. Barnsley, J. Bowen, W. Henman, A. Harris, Ewen Harper, Shirley Smith, J. Barnsley, C. H. Barnsley, B. Whitehouse, W. Sapcote, W. Rudder, J. S. Surman, A. A. Smith, R. Fenwick, J. Webb, &c. After the customary loyal toasts, Mr. T. Barnsley proposed "The City and Trade of Birmingham," to which Mr. E. Parkes, M.P., replied. He said that one reason why trade in Birmingham prospered was, he believed, because of the technical and artistic training which was given there. Artistic training was especially of value in the building trade, and what was wanted for the further success of the trade was for art to bear upon everyday life. At a time like the present, when competition was so keen, it was highly desirable that all engaged in trade should be on the alert to produce the best article at the lowest possible cost, and to this end masters and men must pull together with one common object. Mr. W. Henman, F.R.I.B.A., president of the Birmingham Architectural Association, submitted "Success to the Birmingham Builders' Association," remarking that the success of the building trades also meant employment to many labourers and artisans in the district; it meant employment to manufacturers who supplied the many materials and appliances which were used in the building trades. Further, the public must have a period of prosperity before the building trades became prosperous. The public mind was gradually being educated up to the fact that the suitableness of a town to live in depended very much upon its architectural adornment. He spoke of the indebtedness of architects to builders for giving full effect to their ideas; and said that, though there was a tendency to do without master builders, he should be sorry if ever the time came when they were done away with. He suggested that the Master Builders' Association should offer a prize to student architects in the construction classes. The President briefly replied, and said that Mr. Henman's suggestion would receive consideration. Mr. J. Bowen next gave "The Architects and Surveyors," and said if they compared architects of the present day with those who had gone before, they had nothing to be ashamed of. Mr. W. Henman, Mr. Ewen Harper, and Mr. Arnold Harris responded. The last-named gentleman said that it was a great compliment to the builders of Birmingham that so very few of the important contracts went to outside masters. The other toasts were "The National Association of Master Builders of Great Britain" and "The President and Officers."

Sheffield Society of Architects and Surveyors.—The monthly meeting of the members of this society was held on Dec. 10. An interesting lecture on "Norman Architecture" was delivered by Dr. H. C. Sorby, F.R S. The lecturer gave a short account of the pre-Norman style in England, and exhibited lantern slides of some of the most striking remains. He then showed a few illustrating the architecture in Normandy at about the time of the Conquest, and about twenty years older than the earliest Norman buildings in England. The lecturer then exhibited and described slides prepared from some of the chief buildings in England, illustrating the gradual increase in ornamental details and the introduction of many of new character, until when we arrive at about 1170 a very rapid change occurred, so that in the course of the next 20 years scarcely any of the old Norman style remained, and the so-called Early English style became fully established. During the previous 100 years the amount of progress was most extraordinary.

Society of Engineers.—The forty-second annual general meeting of the Society of Engineers was held on Monday at the rooms of the society, 17, Victoria-street, Westminster, S.W. The chair was occupied by Mr. William George Peirce, President. The following gentlemen were duly elected by ballot as the council and officers for 1896—viz., President, Mr. Samuel Herbert Cox; Vice-Presidents, Messrs. Chas. C. Carpenter, G. Maxwell Lawford, and W. Worby Beaumont; Ordinary Members of Council, Messrs. Joseph Bernays, George Burt, John C. Fell, Chas. Gandon, Percy Griffith, Chas. Mason, Henry O'Connor, and Stephen Sellon; Hon Sec. and Treasurer, Mr. Perry Fairfax Nursey; Hon. Auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A.——The forty-second annual dinner of the Society of Engineers was given at the Holborn Restaurant on Wednesday evening. The president, Mr. William George Peirce, occupied the chair, and a large company was present. The president, in reply to the toast of the evening—viz., "Success to the Society of Engineers," said that the papers read at their ordinary meetings had been well and carefully prepared, and on most interesting subjects, comprising Parliamentary procedure as affecting light railways and tramways, Portland cement, street subways, safety appliances for elevators, relative value of percolation gauges, statistics on the strength of railway axles, and ventilation and warming. All evoked good discussions. The president then dwelt upon the value of belonging to scientific societies, and said that much valuable experience could be gained by belonging to those where opportunities were freely given to the members—both old and young—to take part in the discussions at the meetings. The summer vacation visits to engineering works had been of great interest, comprising the City and Waterloo Railway Works, the City of London Brewery, the Outer Harbour Extension Works and the Electric-Lighting Works at Dover, and the School of Gunnery, Shoeburyness. Lastly, the president advised all the younger members of the profession to take advantage of the opportunities offered by the society, both at ordinary meetings and at the vacation visits to engineering works, for although the modern technical educational establishments did a great deal, there was much to be learnt in actual workshop experience and at visits to works in progress.

CHIPS.

It was decided on Tuesday that the permanent memorial at Aberdeen to the late Professor Robertson Smith shall take the form of filling with stained glass a four-light window in King's College Chapel in that city. The subjects of the lights will be figures of four Hebrew prophets symbolical of the professor's relation to Old Testament studies.

Gresham Baptist Chapel in Barrington-road, East Brixton, a lofty brick structure of three floors, was destroyed by fire on Tuesday night, after a tea-meeting had been held in the school on the topmost story.

The church of St. Mark, at Plumstead, the foundation-stone of which was recently laid by the Duchess of Albany, is being built according to the designs of Mr. Richard J. Lovel, of Queen Victoria-street.

The scheme for laying-out a seaside estate and spa gardens at Bridlington has collapsed, the directors having been unable to go to allotment, owing to the limited number of applications for shares.

At the meeting of the Northern Architectural Association, held at the Art Gallery, Newcastle-upon-Tyne, on Wednesday night the 11th inst., Mr. Percy Fitzgerald, M A., F.R S., delivered his illustrated lecture on "Robert Adam, and his Style of Architecture."

Engineering Notes.

Sellack, Herefordshire.—On Saturday a new suspension bridle-bridge over the river Wye at Sellack, near Ross, was opened. The bridge has been erected on the site of the old ferry, and connects the parishes of Sellack and King's Caple. The engineer was Mr. Louis Harper, A.M.I.C.E., of Aberdeen; the masonry work, concreting, approaches, and decking have been carried out by Mr. John Preece, contractor, Marden, Herefordshire; Messrs. Naylor and Co., Hereford, were intrusted with the erection of the ironwork; and the whole has been done under the superintendence of the architect, Mr. Ernest G. Davies, M.S.A., of Hereford. The bridge is composed of steel wire ropes of suspension type, with vertical rods, 2ft. apart, connecting the upper and lower ropes. The sides are protected by oak skirting and lattice panelling. The bridge has a camber of 3ft. It is supported by four cast-iron columns 25ft. high, and is held up by anchor blocks and rails, secured by concrete. The clear span of the bridge is 190ft.; its total length, including approaches, being 228ft. It has a walking way of 6ft., and is 6ft. 10in. out and out. The flooring is of oak, overlaid with boarding of oak cross-pieces $1\frac{1}{4}$in. thick. There are red sandstone abutments (the material having been obtained from Sellack quarry), with Forest stone coping. The bridge is 25ft. above the summer water level, and is 6ft. higher than the highest known flood level. The cost has been £900.

* * *

A Guild of Sculpture has been incorporated in Ontario, to promote and cultivate the study and taste for that art, and for special training in designing, modelling, carving, and working in metals. It is the intention to hold exhibitions and offer prizes for statuary, and to promote the establishment of a gallery. The president is Mr. L. R. O'Brien, R.C.A., a well-known artist, the director of arts, Mr. Hamilton MacCarthy, R.C.A., the equally well-known sculptor, and Mr. James Van Sommer is the secretary. The studios and offices are at Toronto.

Mr. A. B. M'Donald, the city engineer of Glasgow, has reported on the proposed extension of the fruit market. The work would involve the appropriation of the police office and the adjoining lane, of part of south Albion-street, and of property fronting South Albion, Bell, and Wall-streets, and belonging to the Improvement Trustees. The whole surface thus to be absorbed measures 4,638 square yards. The total expenditnre Mr. M'Donald estimates at £59,000, including £15,800 for the proposed new buildings.

The controller of accounts to the Liverpool Corporation reports with regard to the income and expenditure of the Juvenal dwellings in Cazneau-street in that city, that the net income last year was £551 2s. 5d., and the interest realised was at the rate of £3 8s. 2d. per cent.

On Wednesday week a new Wesleyan chapel and Sunday-schools were opened at South Moor, near Chester-le-Street. The buildings have been erected from designs of Mr. J. W. Thompson, architect, Newcastle. Accommodation is provided for 300 children in the schoolroom, and a similar number of adults can be seated in the chapel. The cost of the structure has been £1,500.

At Cupar, Sheriff Mackay held an inquiry last week, under the Burgh Police Act, in connection with an application by the Water Commissioners of the burgh for a provisional order to authorise an increased supply of water to the Fife and Kinross District Asylum and other purposes, and the borrowing of £7,000 for this object. Provost Macqueen shortly explained the necessity for the increased supply, and the arrangements made with the Fife and Kinross Lunacy Board and with the proprietor of Wemyss Hall, and Mr. H. Bruce, Cupar, produced plans of the proposed works.

Mr. H. Percy Boulnois, the municipal engineer of Liverpool, delivered a lecture to the members of the Engineering Society, at the University College in that city, on "Municipal Engineering as a Profession." Mr. S. Dunkerly, M.Sc. (vice-president), occupied the chair. Mr. Boulnois pointed out the best course to be pursued by young men desirous of entering the profession, and explained the many branches of the work which it would be their duty to perform. He described the salaries of municipal engineers as utterly inadequate, but added that the occupation was one of deep interest, which cultivated keenness of observation and knowledge of a wide range of subjects. He described the methods upon which leading engineers of the present day had based their success in the profession and gave some valuable hints to aspirants.

COMPETITIONS.

Coventry.—At the meeting of the city council, held on September 24th, it was decided to refer the plans for the new municpial buildings by Messrs. Quick, Brewill, Baily, and Mallows, to which the first premium was awarded in the recent competition, to a joint committee, with instructions to "report as to the steps to be taken to provide police buildings, and generally." Since that time the joint committee, under pressure from the Home Office, have been engaged upon the question of bringing the scheme into practical shape. As at first arranged it was found that to carry out the police portion of the scheme would involve the erection of about three-fourths of the whole proposed new municipal buildings. With a view to obtaining the necessary police accommodation at less expense, a sub-committee was delegated to confer with Mr. Harry Quick, the architect, and as a result a rearrangement of the plans has been made by which police accommodation may be provided, at a cost of about £8,000, upon the site of the present police-station.

Hyde.—The Technical Instruction Committee of the borough of Hyde, Cheshire, has recently decided a limited competition in designs for a new technical school and free library. Five architects were invited to send in designs for competition, and those submitted by Messrs. Woodhouse and Willoughby, 100, King-street, Manchester, were successful. The committee opened a public exhibition of the plans in the town-hall on Monday, and it will remain open for one week.

CHIPS.

The city council of Bristol decided on Tuesday to pave certain main thoroughfares with wood, at an estimated cost of £31,000.

The New Shoreham board schools, Sussex, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Cynfaen Wesleyan Memorial Chapel at Calcot, near Holywell, has been struck by lightning, and wrecked. The chapel was of stone, solidly built, and was opened six years ago. The disaster is attributed to an iron cross on the principal gable.

On Monday, a stained-glass window in memory of the late Bishop of Bath and Wells (Lord Arthur Hervey) was unveiled in the parish church of Ansford, Somerset. The window has two lights, representing St. Andrew, the patron saint of the cathedral and the church, and Bishop Ken.

The first of a course of six Rhind lectures in archæology was delivered on Tuesday at Edinburgh in the Scottish National Portrait Gallery by Mr. Arthur J. Evans, M.A., F.S.A., keeper of the Ashmolean Museum and Hon. Fellow of Brasenose College, Oxford. The subject of the course is, "The Origins of Celtic Art."

A service has been held in Upton-on-Severn parish church, to dedicate a new reredos. The background is of Painswick stone, and the sculpture is of white alabaster. The figures in the central panel represent our Lord and the two Disciples at Emmaus; and in the panels on either side are figures of St. Peter and St. Paul, the patron saints of the church. The reredos has been designed by Sir A. W. Blomfield, A.R.A.

The parish cross at Lambourn, which for many centuries has stood in the market-place of this little Berkshire town, has just been restored. The Calvary of seven steps of stone has been taken down, and, after repair, has been replaced, new stone being only inserted where the old was too shattered and broken to be used again. Upon the ancient shaft there was remaining some small portion of the foundation of the Cross; after a study of these remains, the architect, Mr. E. Doran-Webb, of Salisbury, drew a plan which, as near as can be, is a reproduction of the ancient work. Upon the western face is the crucifix, with St. Mary and St. John on either side of the Cross, and upon the eastern face is shown the seated figure of the Blessed Virgin Mary with the Holy Child. At the north end, under a canopy, is the figure of a saint, of which the larger part is original, the head only having been added in completion. At the south end the figure of St. Michael has been placed under a similar canopy. The whole is surmounted by finials and a capital.

The annual report on the working of the Ceylon railways for 1894 has only just been published. The capital expenditure on the railways amounts now to a total of 53,109,981 rupees against 50,759,624 rupees at the close of 1893. The total miles of railway now open aggregate $270\frac{1}{2}$ miles against $231\frac{1}{2}$ miles at the close of 1893.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—E. R. Barker.—S. African.—R. W.—B. B. S. (Leamington).—L. B. and Co.

"BUILDING NEWS" DESIGNING CLUB.

THIRD LIST OF SUBJECTS.

C.—A Small Town Church in a workmen's neighbourhood, to be built on a corner site, with the angle towards the S.E., the total length being 140ft., and the width 52ft.; the east and south walls of the church to follow the frontage lines, which are square. Light can be had above the houses on the west and north sides. The sills of the west windows (which are optional) may be 25ft. from the floor, and those to the windows on the north side may be not less than 20ft. from the ground. The relative proportions of the nave to chancel are left to the designers, who will do well to refer to our reviews of previous church designs submitted in connection with our Designing Club, published in the Building News for Feb. 22, 1889, Feb. 20, 1891, April 28, 1893, and Dec. 7, 1894. This reference is not to copy the plans therein described, but to gather in a general way the leading points necessary to observe in planning churches for worship, and adapted to the ritual of the English Church as now in use. The sanctuary or altar-platform is to be 3ft. 6in. above the nave-floor; but the position of the seven steps is left to the designer. The vestry is to be on the south side of the building (and towards the western end of the church a baptistery chapel is suggested, about 40ft. long by 15ft. wide, with an altar in it adapted to week-day and early celebrations. This chapel, if introduced, should be so located as to be easily entered from the church without exposing the users to draughts from, or noises at, the main entrance to the building. It would be open to the church, so that the font and baptismal service may be readily seen from the nave). The organ is to open into the choir, and the pulpit is to be on the north side of chancel arch. The seating to be shown on the plan, and the accommodation given in a table. A passage-way for the use of communicants returning from the Sacrament would be an advantage. The church is to be inexpensive, but dignified in treatment, and red brick and stone to be used both inside and out. Roofs in timber, covered with slates. There is to be no tower or spire; but accommodation is required for three bells, one to be used for the sanctus, though hung with the others. Plans and section may be to 1-16in. to the foot; other drawings, $\frac{1}{8}$th scale. A sketch-view is desirable.

Drawings Received.—"Veller," "B" in a circle, "La Cigale," "Tadpole," "Sanitas," "Thistle," "Canary."

Correspondence.

LIABILITY OF CLIENTS.

To the Editor of the Building News.

Sir,—What does the decision of the County Court Judge teach us? That an architect (who has possibly had a large premium paid for him, given, say, five years as a pupil and some years to practical education in building construction) may get hold of a client who only wants to "suck his brains" for nothing—in other words, if a man wants a good, practical plan of a house or practical information which he doesn't possess, he has only to go to an architect and get all the information, &c., he wants, and then abandon his project. But what is to prevent him from carrying out the work in a modified form or making use of the information gained? And then, unless certain technicalities in the law are complied with, the architect, it seems, has no remedy. Now, what is an architect's "stock-in-trade"?—his time combined with practical experience; nothing more. He has no commodity to offer, except his brains, and if he is employed upon bogus plans, how is he to live?

In my opinion, if a man employs an architect, and he afterwards abandons his project, he should at least pay him, say, "daily wage"—that is, a fair price for the time occupied in his service. This should be common law.

I hope these few remarks may elicit opinions from some other of your architectural correspondents, and may lead to a means of making clients liable.—I am, &c.,

Winchester, Dec. 7. T. MICKLAM.

STRESSES IN ROOF-TRUSSES.

SIR,—Following Mr. J. C. Palmer's article in the BUILDING NEWS, on Stresses in a Collar-Beam Roof-Truss, of which you say no method has been published for satisfactorily dealing therewith, there is also another point that I have not seen satisfactorily determined for a collar-beam truss—viz., the direction of pressure of such truss upon the wall below. Professor Rankine, in his "Manual of Engineering," gives two examples, in which he says the line of resistance is the dotted line A D (Fig. 1). Again for a semicircular truss, he says (Fig. 2) B E is the line of resistance, E being midway between A and D. But no general rule appears to be given for any or all forms of a collar-beam truss. I venture to suggest that a line upon this in the BUILDING NEWS would be very useful.—I am, &c., J. WYNNE.

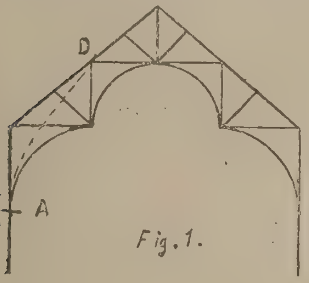

Fig. 1.

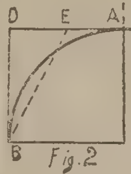

Fig. 2

2, Cooper-street, Manchester, Nov. 23.

PROPOSED N.U. OF ARCHITECTS.

SIR,—That the time has long been ripe for the formation of such a union is an admitted fact, and the thanks of all well-wishers of the profession are due to Mr. Ord for his able and manly advocacy.

During the last few years especially I have noticed a very marked tendency on the part of the public generally, and on the part of the builders particularly, to point the finger of scorn at members of this ancient and honourable profession. On many occasions I have written to various papers in defence of our rights, and appealed to the proverbial fair-play which marks the Englishman, with very little good result. My co-professionals have held aloof, and to that indifference shown by the selfish ones of this world must be assigned the present unstable condition of matters architectural.—I am, &c.,

S. HENRY EACHUS.

Bank Buildings, Lichfield-street, Wolverhampton, Dec. 10.

A CORRECTION.

SIR,—Allow me to correct a misstatement in your issue of Nov. 29, that a new church on Lundy Island is being built from the designs of Mr. C. Pinn, sen., of Exeter. That gentleman acted only as quantity-surveyor to the contractors, who are erecting the church from the designs of yours, &c., JOHN NORTON, architect.

95, Ridgmount-gardens, W.C., Dec. 7.

◆

The corporation of Wolverhampton have obtained the sanction of the Local Government Board for borrowing £5,000 for purposes of electric-lighting.

Intercommunication.

QUESTIONS.

[11464.]—**Rattling Slates.**—I have a mill in an exposed and bleak position, the slates of which rattle. Can anyone tell me the best way to prevent same?—SULPHURLANDER.

[11465.]—**Cold-Air Store.**—What are the requirements of same, and the points to be specially observed in building these? Should they be provided with windows or not?—X. Y. Z.

REPLIES.

[11460.]—**Dormitories.**—In reply to my namesake's inquiry, in all well arranged buildings, dormitories should contain 1,000c.ft. per head. The Local Government Board require 360c.ft. in Poor Law dormitories for both children and adults; but this space is very moderate to what high authorities usually require, and is fixed at the smallest possible minimum, on the supposition that constant and good ventilation is provided. The Education Department do not give any definite regulations on the point in their by-laws respecting public and elementary schools. It must be understood that the less the air space, the more necessity there is for increased ventilation. At the same time, if the air is changed too rapidly, draught and inconvenience will be experienced: hence the desirability of the larger space. Further information will be found in Hurst's handbook, under the heading of "Ventilation."—C. H. CHANNON.

CHIPS.

A new board school at Newhall, Sheffield, has just been opened. It accommodates 720 children, and cost £10,300. It is Renaissance in style, and has a central hall, 86ft. by 36ft., surrounded by ten classrooms. Messrs. Holmes and Watson, of St. James's-road, Sheffield, were the architects, and Mr. S. W. Pattinson, of Ruskington, was the contractor.

The directors of the South-Eastern Railway Company have decided to expend about £20,000 in the enlargement of their carriage building works at Ashford, Kent.

The United Presbyterian Church, Helensburgh, was reopened on Sunday after alterations, renovation, and painting had been carried out at a cost of £500.

At the last meeting of the Margate Town Council a long discussion took place upon a report submitted by the Waterworks Committee. It was agreed to employ an expert in testing the sources of water supply, with a view to extending the works at an estimated cost of about £30,000.

Under the will of the late Mr. James Cowan, of Glengorm, paper-maker, and formerly M.P. for Edinburgh, sums of £500 each are left to Elizabeth, wife of Campbell Douglas, of Glasgow, architect, and Katherine, wife of John MacWhirter, R.A., nieces of the testator.

A special service was held in Farsley Church on Thursday in last week, when the new tower erected to the church in place of the original tower, which it was found necessary to pull down, was dedicated by Archdeacon Bardsley. The cost of the new tower has been about £550.

The reopening of the nave of Erdington parish church, after reseating and the creation of a centre aisle, took place on Sunday. The old high-back pews have been replaced by open seats of pitch-pine, and a pitch-pine screen has been erected at the west end. The work has cost about £360.

Two stained-glass windows are about to be placed by subscription in Selwyn College Chapel, Cambridge, to commemorate the episcopate of Bishop Augustus Selwyn. The windows will be the work of Mr. C. E. Kempe, and the cost of each is estimated at £150.

A party of convicts, in cutting a trench in a field near Borstal Prison, Rochester, came upon three Roman interments 4ft. below the surface. The skeletons lay in line from 6ft. to 8ft. apart, in cists excavated in the chalk. These cists were 7ft. in length, and about 3ft. in width. With the skeletons were found two small vases of brown pottery, and a pattern of black ware. The bodies had been protected by slabs of wood, fastened together in one instance by iron nails. Mr. George Payne, F.S.A., secretary to the Kent Archæological Society, has made a survey of the discoveries.

On Thursday in last week the reopening took place of the chancel of Lowdham Church, Notts, which has been undergoing structural renovation. The work of restoration was rendered necessary owing to the lack of foundations and the action of the damp. Earl Manvers undertook to rebuild a great part of the chancel, and to make provision for drainage. All the eastern portion of the walls has been rebuilt on strong foundations and with the addition of buttresses. Round this portion a dry area has been laid down; and battlements have been added to the roof. The old three-light east window, which was unworthy of the church, has now been replaced by a four-light window.

Legal.

NUISANCE ON VACANT LAND.

THE value of house property and building land may be, and often is, greatly affected by the use made of plots or pieces of vacant land adjoining or in the neighbourhood. In many places, and sometimes even in rising residential suburbs, there are such vacant lands, and if these are let out so as to become a nuisance the effect upon rentals round about is likely to be serious. It is not uncommon for the owners of these waste places, while waiting for someone to build upon them, to let them out for fairs or circuses, or the like, and it is a most troublesome thing for the adjoining occupiers to get this nuisance stopped, In a recent and most interesting case (*Times*, Dec. 4), the Heston and Isleworth Urban District Council brought an action against one Stone, who was the owner of a piece of land adjoining the Kingsley-road, Hounslow, for an injunction to prevent the defendant from letting this place be used as a sort of gipsy encampment. It appeared that since early in 1894 the defendant had been allowing gipsies to keep their vans and tents upon the land for a certain weekly payment, in such a way as, by reason of the insanitary state of the land, absence of proper drainage, overcrowding, noise, dirt, and untidiness, to be a nuisance to the inhabitants in the neighbourhood, and injurious to health. The evidence was, as usual, very conflicting, the defendant, who doubtless made a good thing of the business, calling numerous witnesses, and especially the gipsies themselves, to swear to the sanitary state of the place and its order and cleanliness.

But Mr. Justice Romer, after weighing all the evidence, came to the conclusion that a nuisance had been established. Indeed, the testimony of these dwellers in vans and tents in the open air as to what is a sanitary state of things and what is meant by cleanliness would obviously be unreliable. For, without charging them with giving false evidence, it is clear that these questions are really matters of degree and proportion, and that their savage standard of life would give them no experience of what we nowadays mean by sanitation. The perpetual injunction was therefore granted, and these people will have to go farther away from suburban dwellings to pitch their gipsy encampment.

FRED. WETHERFIELD, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

ARCHITECT.—DRAWINGS.—OWNER.—The client can claim the plans when he has paid for them, either by the commission usually chargeable or so much for the work done.

◆

A new porch is to be erected at the Whitby Chapel entrance to Hawarden Church by Mr. Henry Neville Gladstone. It will be in keeping with the style of the other porch, but a niche will be left above the door for one or two figures.

A Local Government Board inquiry was held by Major-General Crozier at the Audit House, Southampton, on Wednesday, as to an application from the corporation to borrow £6,000 for purposes of water supply.

The fourteenth annual general meeting of the West of Scotland Sanitary Association was held on Friday in the Religious Institution Rooms, Glasgow, Mr. R. Easton Aitken in the chair. Mr. W. R. M. Church, C.A., secretary, submitted the report, which recorded that 461 houses had been examined, and 681 inspections made, during the year. The year's expenditure had exceeded income by about £36, and the balance at credit of the society was accordingly reduced to £135. Office-bearers were afterwards appointed, Lord Provost Sir James Bell being elected president.

A cottage hospital has been built in Bank-street, Trowbridge, from plans by Mr. E. Gunstone. It is faced with Atworth stone with Westwood stone dressings. Messrs. Bigwood and Co. were the contractors.

As a memorial of the forty years' service of the Rev. Canon Eldon Bankes, rector of Corfe Castle, new schools have been erected in the parish by public subscription. The builders were Messrs. Chinchin, of Bournemouth, and the architect was Mr. W. J. Fletcher, of Wimborne. The opening ceremony was performed last week by the Bishop of Salisbury.

LEGAL INTELLIGENCE.

An Edinburgh Arbitration. — The second reference case in connection with the acquirement of the two end tenements in North Bridge-street, Edinburgh, necessary for the abutments of the new bridge, was begun on Saturday in the Clarendon Hotel, and has continued throughout the current week. Some weeks ago a four days' proof was led in connection with Messrs. Marshall and Aitken's property, and the proof commenced on Saturday is in connection with the property on the east side belonging to the trustees of the late Mr. James M'Intosh. The claim is for £9,750, and the arbiters are Mr. John Blair, W.S., for the city, and Mr. James Watherston, builder, for the claimants; with Mr. Alexander Ure, M.P., as oversman, and Mr. John Shaw, S S.C., as a clerk to the reference. The claimants' case is supported by the following skilled witnesses:—Mr. W. W. Robertson, of H.M. Board of Works, Master of the Merchant Company; Mr. T. P. Marwick, architect; Mr. Peter Lawrence, surveyor; and others. The witnesses on behalf of the corporation are Mr. W. Hamilton Beattie, architect; Mr. Halden Beattie, builder; Mr. W. Ormiston, surveyor; Mr. James Barr, C.E., Glasgow; and others. The decisions in these two cases will have an important bearing on the prices to be paid for the properties situated between these tenements and the High-street, which will be acquired by the corporation for the widening of the street.

Paving Apportionments.—At Lambeth Police-court, Mr. Hopkins heard, on Tuesday, an adjourned summons taken out by the Lambeth Vestry against the London County Council, as owners of land on the north side of Peckham-Rye Park, to recover £365 11s. 8d., being paving charges alleged to be due from the Council in respect of the paving of Colyton-road. It appeared from the evidence on behalf of the Vestry that a portion of Peckham-Rye Park abuts upon a thoroughfare called Coylton-road, which has been taken over by the Vestry under the powers vested in them by the Metropolis Local Management Act. The cost of paving the road was apportioned among the various owners by the vestry, and a demand was made upon the Council for £365 11s. 8d. as their contribution towards the expenses. Mr. Innes contended that the Council had so dealt with portions of the park as to make them beneficial owners within the meaning of the Act. For the defence, Mr. Avory took the objection that no demand, apart from the notice of apportionment, had been made upon the Council, and contended that the Council were not beneficial owners. Mr. Hopkins said he would take time to consider his judgment.

Warwickshire Railway Arbitration Awards.—Mr. Daniel Watney, the president of the Surveyors' Institution, has issued his award in the cases recently heard before him in London as to claims against the Manchester, Sheffield, and Lincolnshire Railway Company for compensation for land on Lady Hood's estate and for the vicarage of Wolfhamcote (nine miles from Rugby and four from Daventry). In the first case Lady Hood's trustees claimed £7,000 for injury to about 600 acres in the parish of Wolfhamcote, pasture and grazing land, and for 24a. 1r. 28½p. which were actually required for the line. Mr. Elwell, chief surveyor of the Great Northern Railway Company, and consulting surveyor to the War Office, and Mr. Denston Gibson (Messrs. Chesshire, Gibson, Fowler, and Wharton, 98, New-street, Birmingham) were the principal witnesses for the claimants; Mr. Arthur Vernon, High Wycombe, and Mr. Garrard, 8, Frederick's-place, City, were the leading witnesses for the company, and their valuations were about £3,000. The umpire awards Lady Hood the sum of £3,847. In the second case the company were compelled to take the whole of the vicarage and grounds at Wolfhamcote, of which they actually required only twenty perches. The same experts were engaged on the respective sides, and their valuations were (for the claimants) about £1,850, and (for the railway company) £1,050. The award is for the sum of £1,277.

◆

Three new operating-rooms are about to be added to the Western Infirmary at Glasgow, from plans by Mr. J. J. Burnet, A.R.I.B.A., of that city, who, in conjunction with Dr. Macintosh, the medical superintendent of the infirmary, has been visiting the principal Continental operating theatres. The proposed outlay is about £10,000.

The town council of Ipswich decided at their last meeting to purchase another portion of Christchurch Park, consisting of 1,307 rods, lying between the part of the grounds already acquired and Westerfield-road. The cost to the corporation of this, the third section bought, will be £4,750, another £1,000 having been raised by subscription. The town council has already paid £25,000 for the centre of the ground, besides £9,100 subscribed, and the outer ring of land is being built on, whereas in the first instance the entire area was offered for £35,000.

WATER SUPPLY AND SANITARY MATTERS.

Leek.—At Leek, on Friday, Mr. W. J. Bird Clerke, M.Inst.C E, held an inquiry into an application made by the urban district council to the Local Government Board for sanction to borrow £1,100 for works of sewage disposal, and £1,000 to be used in extending and improving the town baths, and also for an extension of the period allowed by the Local Government Board for the repayment of a loan of £1,631, sanctioned in July last, for the purchase of land for allotment purposes. Mr. E. W. Ives, C.E, and Mr. John Wollatt (secretary) represented the Universal Sewage Purification Company (Derby), and the clerk to the urban council stated that that authority had entered into a provisional agreement with the Universal Sewage Purification Company, of Derby, for the erection of an "Ives" tank capable of treating 400,000gal. of sewage per twenty-four hours. The tank was proposed to be used for the south drainage district. Evidence was also given by Mr. Myatt, the surveyor, as to the sewage works and the public baths.

◆

CHIPS.

New schools are about to be built for the East Barnet School Board in the Brunswick Park district, from designs by Mr. W. Pywell.

The December address of Mr. F. Chandler, of Manchester, the secretary of the Amalgamated Society of Carpenters and Joiners, opens with the cheering observation: "It is exceedingly satisfactory to note that in the closing months of the present year trade continues exceptionally good, the percentage of unemployed comparing most favourably with the corresponding period of 1894, when we had at least double the number out of employment."

Mr. W. North, of Gottisham, has been elected highway surveyor to the rural district council of Honiton.

The memorial-stone was laid on Thursday in last week of a chapel which is being added to the workhouse buildings at Elham, near Folkestone, and at the same time the new infirmary was formally opened. Mr. J. Gardner, of Folkestone, is the architect for both buildings, and Messrs. Wallis and Sons, of Maidstone, are the contractors.

At the Manchester Assizes, on the 5th inst., a jury awarded £240 damages to the Manchester Brewery Company, Limited, the owners of some property at Oldham which was partially demolished by the fall of a wall at the old Phœnix Mill during a gale on the 11th February, 1894. The mill had been burned, and the wall which was blown down had, the plaintiffs alleged, been left insecure by the owners.

A town's meeting held at Weston-super-Mare has approved a scheme formulated by the district council, providing for the construction of marine lakes, a low-water pier, and other improvements, at an estimated cost of £128,000.

The schools attached to Crown-street Congregational Chapel, Ipswich, were reopened on Thursday, the 5th inst., after having been reconstructed and enlarged at a cost of £1,230. Mr. Frank Brown, Tower-street, Ipswich, was the architect, and Messrs. Thos. Parkington and Son, of the same town, were the builders.

The city council of Hereford have voted Mr. Parker, the city surveyor, an honorium of £50 for extra services in relaying the water-mains.

An Imperial edict was issued at Pekin, on Sunday, ordering the construction of a double line of railway, 72 miles in length, between Pekin and Tientsin. The cost of the undertaking is estimated at 3,000,000 taels, and the weight of the rails will be 85lb. per yard.

The Monmouth town council have received a letter from the Local Government Board consenting to grant powers to the corporation to borrow £20,000 for the purpose of carrying out the combined scheme of drainage and electric light for public and private lighting in the borough.

The new post-office at Southwold was opened for business last week. Mr. Robert Allen, of that borough, was the builder.

A special committee of the town council of Portsmouth is considering the question of the advisability of purchasing the undertaking of the local water company. The latter ask £1,000,030 for the works, of which £14,000 is allotted as compensation for the directors and officials, including £3,800 for the consulting engineer.

Mr. J. L. D. Meares, C.E., town surveyor of Newry, has, on the recommendation of the Lord Lieutenant, been appointed a magistrate for County Armagh.

The Liverpool Corporation are building a new free library at Everton from the designs of the city architect, Mr. Thos. Shelmerdine. Messrs. Paterson and Son are the builders, and the floors are fireproof, on the "Mark Fawcett" system.

Our Office Table.

Mr. E. J. Poynter, R.A., writes to the *Times*, pointing out that the banqueting house or orangery in Kensington Garden, "a masterpiece of proportion and of picturesque originality," one of the works of Christopher Wren, has for years been used as a potting-shed, and is being injured by neglect. The platform of Portland stone on which it is raised, as carefully studied as to its mouldings and proportions as the rest of the exterior, is, Mr. Poynter says, falling out of repair, and its stones are becoming disjointed and damaged under rough usage. Externally the other architectural features of the building are in good preservation, but the condition of the roof is doubtful. The internal decorations are of the highest beauty, in the rich but purely Classical taste of the time, and of the best work. At each end of the long banqueting-room is a rotunda, panelled and adorned with Corinthian columns, and cornices with elaborately enriched mouldings all in carved wood, executed in the finest taste and at great cost. The principal room was decorated in the same rich way; but a large extent of the panelling, with its carved mouldings, has been torn down from the back wall for the more convenient placing of rows of rough shelves to hold the ranges of flower-pots kept there during the winter. Mr. Poynter pleads for the preservation of this unique example of Wren's work, and makes the apposite suggestion that it might be utilised as a small museum of objects of historic interest, illustrating the record of the old Court suburb.

A general photographic survey of England and Wales is projected on the lines of the one successfully carried out in Warwickshire during the past few years, in connection with the Birmingham and Midland Institute. Such surveys have since been carried on by the Royal Society of Antiquaries of Ireland, and by various English societies. The larger scheme is being initiated by a congress of archæological societies in union with the Society of Antiquaries, and Mr. Ralph Nevill, F.S.A., F.R.I.B.A., has accepted the office of honorary secretary. The Archæological Congress have drawn up a code of suggestions, and will use their representative position to promote the general adoption of county surveys. Now that there are so many workers in the field of photography, it is thought that they will be thankful for some directions that may enable them to join in a general scheme for obtaining so important a survey of the kingdom. Mr. Nevill will send copies of the report to such photographic societies and clubs as may wish to have them and to individuals on receipt of 1d. for postage.

Property owners and those intrusted with the management of property will be interested to learn that the representations recently made to the Lord Chancellor by the council of the Auctioneers' Institute of the United Kingdom with reference to the proposed new rules under the Law of Distress (Amendment) Act, 1895, have been adopted by his lordship. The rule making it obligatory upon a bailiff to get his general certificate endorsed by the Registrar of the County Court of the particular district in which the distraint has to be made, to which the greatest exception was taken by the council of the institute, has been completely expunged. The rules as finally revised will shortly come into operation.

The report of the committee appointed by the conservators of the Thames to consider the question of the Thames floods states that no legislation has imposed on the conservators the duty of dealing with floods, and that the funds provided by Parliament for the conservancy are not available for this object. But the conservators have, in the restoration and improvement of the navigation, so constructed the works as to afford greatly increased facilities for the escape of flood water. Since 1877 £33,000 has been spent in dredging operations above Staines and £18,500 between Staines and Teddington. The report points out that, while the conservators have gone to the limit of their powers to give effect to the views of the Select Committee of the House of Commons which dealt with the subject of Thames floods in 1877, the local authorities and inhabitants of the Thames Valley have taken no steps to carry out those of the committee's recommendations which concerned them. The committee suggest that the conservators should, in the future as in the past, direct their attention to carrying out works for the improvement of the navigation, which will concurrently relieve the valley from floods. They recommend that local authorities and landowners in the Thames Valley should apply to Parliament for powers to raise money, as already granted to the Thames Valley Drainage Commissioners for the district above Long Wittenham. The committee, however, point out that the only really effective plan for reducing the level of the more serious floods is by a systematic enlargement of the sectional area of river, by widening and deepening the channel.

The cable tramway on the Brixton high road has been extended from Telford - avenue to opposite the Tate Free Library at Streatham, an extension southwards of three-quarters of a mile, giving a continuous cable line from Kennington Church to the latter point, a distance of $3\frac{1}{2}$ miles. The formal inauguration took place on Saturday, but the extension had not, however, been brought into use, although passed by Major Marinden on behalf of the Board of Trade. The work has been carried out under the supervision of Mr. James More, engineer to the contractors, Messrs. Dick, Kerr, and Co., of Kilmarnock and Leadenhall-street, E.C., and has been carried out without stoppage of the cars, although the cable to Kennington has been replaced by a new one $3\frac{5}{8}$in. in circumference, made, like the one in the extension to Streatham, by Messrs. Wilkins, of Wapping.

Lord Kingsburgh gave a lecture on Monday night before the Royal Scottish Society of Arts, Edinburgh, on "Electricity in the Household." The chair was occupied by the president (Professor Armstrong). Lord Kingsburgh declared that electricity had come to stay. The development of its use was shown by the fact that in Edinburgh Professor Kennedy, the skilled adviser of the corporation, had laid his plans upon the footing that provision for 40,000 lamps would be amply sufficient for the next three years; but at the end of fifteen months the whole number of lamps was already taken up, and the corporation was engaged in a frantic effort to make the plant sufficient for the demands made upon it. Lord Kingsburgh pointed out that the three main uses of electricity in the household were lighting, heating, and mechanical power. In order that electricity in the dwelling-house might be satisfactory and economical, they must have a current flowing at a certain pressure, and the apparatus to be employed must be adapted to the pressure there was at a particular place. The first thing anyone putting electricity into his house should do was to divide up the sources of supply, after passing the meter, into one or two main branches. It was very important that the proper kind of wires were used, and he urged that the wire section should be large enough. They had to guard against any chance of contact between two wires in the same loop; and especially in the case of the wires carried under the plasterwork, it was a good thing to have them in two separate metal tubes several inches apart. Care should be taken, too, that the wires were not affected by damp, else there would be a loss of illuminating power. He recommended, further, that lamps should be employed which were intended to take a slightly lower pressure than the pressure supplied. His lordship proceeded to illustrate, by the use of apparatus and devices, how economy could be practised in the use of electric light. Comparing it with gas in the matter of cleanliness, he said that if gas had existed three hundred years ago the works of Raphael and the old masters would not have come down to us at all. While they could not speak very definitely as to the cost of domestic lighting by electricity, yet with reasonable economy, and taking into consideration its great advantages, it would be found that the expense was not seriously greater than the expense of gas.

It is proposed to hold an exhibition at the People's Palace, Mile End-road, in 1896, of the arts, trades, industries, and handicrafts existing in the eastern and other industrial districts of London. It will be an extension of the one held at the same institution during the summer of 1887. Of the proposed guarantee fund of £10,000, about £6,000 has already been raised. If any profits should accrue, they will be devoted to social and educational purposes in East London. The scheme will form five sections:—1. A representative exhibition of the industries of the east and other industrial centres of London. 2. An exhibition that shall encourage, by means of public competition, the arts and industries of individual craftsmen in London. A schedule of prizes will be provided for such exhibitors, in addition to certificates of merit. 3. An exhibition of the work of students at the People's Palace and other polytechnics, technical institutions, and public elementary schools of London generally, and of trade apprentices. 4. An historical loan exhibition, showing models of work manufactured in times past. 5. A display of appliances and products bearing upon the social and hygienic welfare of the population, supplemented by lectures.

"Artificial Paving Slabs" was the subject of a paper recently read before the Liverpool Engineering Society by Mr. Arthur Musker. Artificial stone originated, the lecturer remarked, with a Mr. Ranger, who, in 1832, patented a stone made of silicious material in combination with brick or stone, using as a matrix Dorking or other limes in their pure states, mixing the mass with hot water, and then forming it into blocks. In 1842, Mr. Buckwell patented a "Granitic Brescia" stone, using Portland cement as a matrix, and oolitic or magnesian limestone as an aggregate. Slabs of this material laid as pavement in 1845 were in good condition in 1879. The Ransome stone, using silicate of soda as the cementing material, was introduced about the same time. Mr. Highton's Victoria stone was the next in order. This was made of pulverised granite mixed with Portland cement. The concrete thus produced is steeped in a solution of sodium silicate. The granite used must be clean, and to insure this it is thoroughly washed before incorporation with the cement. The usual method of manufacture has been to thoroughly mix the materials, first dry and then wet, as little water as possible being added, in the proportion of three parts of the granite powdered to pass a $\frac{3}{16}$in. mesh to one part of Portland cement. The concrete is then filled into the mould and carefully trowelled. Here it remains a few days, when the slab is removed to mature, which takes about 12 months. Some makers steep the slabs, before being put away to mature, in a solution of sodium silicate for 10 or 14 days. Machinery has been largely used of late years, powerful hydraulic presses being used to compress the concrete into the moulds.

It has been already mentioned that the piece of land which is situated at the bottom of the Haymarket is at last to be covered with a block of buildings. The Opera House itself, of which Mr. Walter Emden, M S.A., is the architect, will occupy almost exactly the same area of ground which the former "Her Majesty's" covered. Its chief entrance will be in Charles-street, on the north side of the building, which has the advantage of not being a thoroughfare. The stalls and grand tier will be reached by marble staircases leading from an entrance-hall of magnificent proportions. The boxes are to be constructed in such a manner that, while maintaining the privacy which is so great a comfort, it will be possible to obtain an improved view of the stage from every seat. The Royal entrance will be in the Haymarket, where also will be additional entrances and exits to all parts of the theatre, which will have their counterparts on the other side, as well as in the existing Opera Arcade, making a total of no less than fourteen besides the grand entrance. It is calculated that by these provisions the entire house will, if necessity should arise, be capable of being emptied without pressure in less than three minutes. Shops will have their place in the Haymarket and Pall Mall, as well as in the Opera Arcade on both sides of the existing thoroughfare, and also in the new Arcade running across the building between the Haymarket and the present Arcade. The remaining portions of the buildings will be occupied by a restaurant of a high class, and by chambers for offices and other purposes. Arrangements have also been made to provide the necessary rooms for a club, should they be required.

The following lecture arrangements have been made for the Royal Institution before Easter:—Prof. J. G. M'Kendrick (six lectures adapted to a juvenile auditory), on "Sound, Hearing, and Speech" (experimentally illustrated); Prof. C. Stewart, eleven lectures on "The External Covering of Plants and Animals: its Structure and Functions"; the Rev. Philip H. Wicksteed, four lectures on "Dante"; Prof. H. Marshall Ward, three lectures on "Some Aspects of Modern Botany"; the Rev. William Barry, D.D., four lectures, "Masters of Modern Thought—Voltaire, Rousseau, Goethe, and Spinoza"; Prof. C. Hubert H. Parry, three lectures on "Realism and Idealism in Musical Art" (with musical illustrations); Lord Rayleigh, six lectures on "Light." The Friday evening meetings will begin on January 17, when a discourse will be given by Lord Rayleigh on "More about Argon"; succeeding discourses will probably be given by Prof. Burdon Sanderson, Mr. W. S. Lilly, Dr. John Murray, Mr. J. J. Armistead, Dr. Edward Frankland, Mr. A. R. Binnie, Mr. Sidney Lee, Prof. T. R. Fraser, Prof. Dewar, and others.

CHIPS.

The parish church of Llandrindod Wells is undergoing enlargement and restoration. The work has been undertaken by Mr. Robert E. Davies, builder, of that town, at £1,200.

Mr. Andrew Carnegie has offered to pay the half of the purchase price and the cost of the reconstruction of Leyden's cottage, on condition that the people of Denholm adopt the Free Libraries Act, and make the cottage their library and museum.

In the case of George Veale Colliver, of Dornton-road, Balham, S.W., builder and contractor, the discharge from bankruptcy has been suspended for two years ending Nov. 7, 1897.

A new infants' school, erected in Bull-lane by the West Bromwich School Board, was opened on the 5th inst. The school will accommodate 298 children, the cost of building was £2,313, the site, furnishing, and other expenses bringing the expenditure up to £3,167. The school has been erected by Mr. C. A. Horton, builder, Brierley Hill, under the supervision of Mr. A. Long, architect.

The United Presbyterian Church, Loanends, Templepatrick, N.B, has been rebuilt and enlarged at a cost of £800. Opening services were conducted on Sunday.

At a general meeting of the Empire Palace, Sheffield, it was stated the cost of the scheme had been nearly £50,000.

All Saints' Church, Barlby, near Selby, which was reopened last week, has been restored at a cost of £900, from plans by Mr. C. Hodgson Fowler, F.S.A., of Durham. Mr. F. S. Ullathorne, of Selby, was the contractor.

Additional accommodation has just been provided for patients at the County Asylum, Prestwich, Lancashire. The floors have been laid with wood blocks upon Roger Lowe's system, of Farnworth, near Bolton.

What was formerly Junction-street Hall, Leith, was opened on December 5th as a church for the Ebenezer United Presbyterian congregation, for whom the interior has been reconstructed. A new platform has been constructed, with the pulpit in the centre, at the south end of the church, with accommodation in front for the choir. Galleries have been carried along both sides, and the entire building now has sitting accommodation for about 800 persons, the seats being made of pitch-pine. The building has been repainted and redecorated. A hall for mission purposes has been constructed at the back for 200 persons. The architect was Mr. W. N. Thomson, Leith.

The Belgian Government has let the contract for the construction of a ship canal, six miles in length, from Heyst to Bruges, making the latter a seaport, to Messrs. Coiscau and Cousin, contractors. The total cost of the work will be £1,560,000, towards which the State contributes £1,080,000 for the port at Heyst, while £200,000 will be paid by Bruges.

The Bishop of St. Alban's unveiled, in St. Alban's Cathedral, on Monday, a memorial to the late Bishop Blomfield, first suffragan of the diocese. The memorial, which takes the form of a sarcophagus of Caen stone, with richly-carved traceried panels, ornamented with statuettes of the four Evangelists, stands close to that recently erected to the late Bishop Claughton. The work was executed from a design by Sir Arthur W. Blomfield, A.R.A., brother of the late bishop.

The Prince of Wales presided on Monday night at a dinner of past and present members of Trinity College, Cambridge, held at the Hôtel Métropole, to celebrate the completion of the buildings of the Trinity College Mission, Camberwell. The buildings have been erected in two sections, from plans by Sir A. W. Blomfield, A.R A., at a total cost of £12,000. Subscriptions promised during the evening amounted to four hundred pounds more than the £2,200 required to clear off the debt which had been incurred.

Mr. Thomas Gildard, for twenty-seven years an architect in the service of the Corporation of Glasgow, died on Friday at his residence in Berkeley-street in that city. Tall, and of striking appearance, Mr. Gildard was a well-known figure in the city, and was popular in artistic and literary circles. Born at Luss, Loch Lomond, in 1822, Mr. Gildard had entered upon his seventy-fourth year.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. "Græco-Phœnician Architecture in Cyprus," by Dr. Max Ohnefalsch Richter. 8 p.m.

Tuesday.—Society of Arts. "Jamaica," by Frank Cundall. 4.30 p.m.

Society of Architects. "A Year's Work under the London Building Act of 1894," by Ellis Marsland, hon. sec. St. James's Hall, Piccadilly. 8 p.m.

Institution of Civil Engineers. "Design and Testing of Centrifugal Fans," by H. Heenan and W. Gilbert. 8 p.m.

Glasgow Architectural Association. Lecture by J. A. Morris, F.R.I.B.A., of Ayr.

Wednesday.—Architectural Association. Combined Meeting of Discussion Section and Camera Club. "Holland House," by E. W. M. Wonnacott. 7 p.m.

Society of Arts. "Machines for Composing Letterpress Printing Surfaces," by John Southward. 8 p.m.

Northern Architectural Association. Evening meeting at Consett Iron Works. To meet at Consett Station 6.10 p.m.

Friday.—Architectural Association. "Leadwork," by C. Hill; and "Woodwork," by R. Rust. 7.30 p.m.

Carpenters' Company. Sanitary Examination. Carpenters' Hall. 5 p.m.

Saturday.—Carpenters' Company. Sanitary Examination. Carpenters' Hall. 2 p.m.

◆

The Society of Architects.

Founded 1884. Incorporated 1893.

The SECOND ORDINARY MEETING of the Society of Architects for the Session 1895-96 will be held at the Rooms of the Society, at St. James' Hall, Piccadilly, W., on TUESDAY, December 17th, at Eight o'clock p.m., when a Paper will be read by Mr. ELLIS MARSLAND, Honorary Secretary, entitled: "A YEAR'S WORK UNDER THE LONDON BUILDING ACT OF 1894."

MONTAGU BALDWIN, Acting Secretary.

◆

CHIPS.

The full tale of the loss caused by last winter's severe and prolonged frost is scarcely yet told. The directors of the Grand Junction Water Company report their losses by the frost at £20,559, besides an expenditure of £15,000 on lowering their mains. The consequence is that the dividend for the half-year comes out at the reduced rate of 6 per cent.

Mr. W. Banks Gwyther, A.R.I.B.A., of the Public Works Department, Calcutta, has been appointed examiner of the school of art in that city in succession to the late Mr. W. H. Jobbins, who was also the head master.

The casting of the great bell for the tower of St. Francis de Sales Church, Cincinnati, has been completed. It is claimed that it is the largest bell in the United States, and 15 tons of bell-metal were used in the casting. In addition to this, the clapper weighs 640lb. The main dimensions of the bell are: Diameter of the ring 9ft., diameter of the crown 5ft. It is 7ft. high. Swung in the tower, the bell is to cost £2,000 sterling.

An institute and working-men's club, which the Duke of Westminster has presented to the parish of St. Mary-without-the-Walls, at Handbridge, on the outskirts of Chester, has just been opened. The building contains an entrance-hall and staircase, 20ft. by 16ft., leading to two billiard-rooms. The upper floor consists of a large meeting-room, 48ft. by 24ft. The building is of red brick, with stone dressings and mullioned and transomed windows, the whole forming a free treatment of English Renaissance. The contractors were Messrs. Parker Bros., and the architects Messrs. T. M. Lockwood and Sons, of Chester.

Four tenders have been received by the Swanage Pier Company for the erection of a new pier at Swanage, the lowest being that of Messrs. Dixon and Thorn, of Cannon-street, London, and the next that of Messrs. Roe and Grace, Southampton.

A spire has been added to the Presbyterian chapel in Manchester-road, Rochdale. The old tower was 40ft. in height, and it has been carried up two additional stages, so that it is now 70ft. high. The spire rises to a further height of 56ft., its total height from the ground, therefore, being 126ft. Messrs. W. A. Peters and Sons, of Rochdale, have carried out the building operations from plans prepared by Messrs. Butterworth and Duncan. The cost of the addition has been about £1,000.

The town council of Glasgow discussed at their last meeting whether the proposed competition for decorating the walls of the banqueting hall at the Municipal Buildings should be thrown open or restricted to eight firms, as proposed by a committee. Eventually the committee's recommendation was adopted.

The decoration of St. Anne's Roman Catholic Cathedral, Leeds, described by us last week, p. 835, foot of first column, was carried out by Mr. Robert Hitch, and not, as therein stated, by his brother, Mr. Nathaniel Hitch.

At the Rochdale County Police-court, on Friday, the Whitworth Urban District Council was fined £50 and £5 costs for disobeying a river pollution order made in October, 1893, by polluting the river Spodden between June and November, 1895. The council was also ordered to have its sewerage works completed by the 31st August next.

At Knypersley Church, Staffs, a new organ was opened last week. The instrument is of three manuals and 26 stops. The fittings are of oak, and the front pipes of spotted metal. There are altogether 1,050 pipes, and the pedals are on the double-acting composition principle. Messrs. Steele and Keay, of Burslem, are the builders.

The new gas-holder at Plymouth was formally inaugurated on Thursday in last week. It is constructed entirely of Bessemer steel, is 150ft. in diameter and 155ft. in height from the base of the trench when full. The capacity of the holder when fully inflated is two million cubic feet of gas. The tank contains 2¾ million gallons of water. The gas is carried into the holder, and distributed from it in pipes of 3ft. internal diameter. The exposed position of the holder, being open to the full pressure of S.E. and S.W. gales, has necessitated the use of massive trellised steel guide-framing. This is composed of eighteen standards 125ft. in height, and 72 steel girders, each 30ft. long and 3ft. wide, the whole braced in all directions by steel wind-ties. There are 216 rollers and carriages which guide the vessel as it rises and falls. The tank and holder has been constructed by Messrs. Willey and Co., of St. Thomas, Exeter, from plans by Mr. John West, M.Inst.C.E.

A deputation representing all the district lunatic asylums in Ireland, with the exception of the Belfast and Londonderry Asylums, waited upon the Chief Secretary for Ireland at Dublin Castle on Friday, for the purpose of asking his assistance in obtaining a reduction of the rate of interest charged by the Treasury on loans for building purposes from 3½ per cent. to 2½ per cent., and also with the view of obtaining an increased capitation grant. The Chief Secretary, in reply, said that the rate of interest could not be reduced, for if it were the Treasury would lose 1 per cent. With regard to the capitation grant, that was a different question altogether, and he would not fail to present the views of the deputation to the Treasury in the most favourable light.

St. Mark's Church, Coventry, was reopened on Friday after renovation. The work was intrusted to Mr. Johnson, of Holyhead-road, Coventry, and included the colouring of the walls, and the painting of a dado, with a stencilled border, the design of Mr. H. Quick. The woodwork has also been painted. A new heating-apparatus has been provided, and at the east end within the altar rails the walls have been hung with painted canvas, supplied by Watts, of London, the designs, which are the work of Messrs. Bodley and Garner, being executed in green, blue, and gold. A hanging of velvet has also been placed there, and in front of the altar rails the tiles are covered with Axminster pile.

At Monday's meeting of the town council of Walsall it was reported that plans for extensions at the Pleck Gasworks, prepared by the gas manager, for which a loan of £50,000 had been applied for, had been ordered to be proceeded with; and that the town hall scheme and a proposal to buy a field adjacent to the baths in Lichfield-street, with a view to the erection of municipal buildings thereon at some future time, would both remain in abeyance for twelve months. The reports were adopted.

There was unveiled in East Bank United Presbyterian Church, Hawick, on Friday, a portrait of the Rev. Professor Orr, D.D., Edinburgh, the professor having formerly been minister of the congregation. The portrait is in oil, three-quarter length, and has been executed by Mr. Frank Wood, art master, Hawick.

The space on the north side of Henry VIII.'s Chapel, Westminster Abbey, and that adjoining the Chapter-house will soon be cleared for by order of H.M. Commissioners of Works, the entire block of eighteenth-century houses in Abingdon-street, long a source of danger from fire, are about to be sold by auction and demolished. No decision has been arrived at as to what shall be done with the site, which will be temporarily levelled, and laid out with turf.

An American paper says:—Botany and gardening are made branches of general education in the Old World, and consequently botanic gardens are far more numerous than they are with us. In France there are 22, in Germany 35, Great Britain and Ireland 11, Indian Empire 9, Italy 22, Russia 14, and even the comparatively insignificant islands of New Zealand have three, while there are but five public ones in the whole United States. While almost every cultivated person in the Old World is familiar with nearly every plant and tree that is seen more or less in every-day life, a large majority of our cultivated people would consider themselves pedantic to use even the commonest botanical name.

New board schools are in course of erection in Barcroft-street, Cleethorpes. Mr. Marrows, of that town, is the builder.

The Lord Provost of Dundee opened on Friday the new public baths and library which have been provided for Lochree, erected out of a bequest of £10,000 by the late Mr. Thomas Cox. The greater part of this sum has been utilised for the erection of the structure, the remainder being set aside for annual upkeep. The style adopted is Flemish Renaissance. A swimming-pond has been fitted up, measuring 60ft. by 25ft., and having 6ft. 6in. depth of water at one end. A laundry and drying room is provided, while the reading-room measures 30ft. by 22ft.

Mrs. J. R. Green gave a lecture on Saturday night at the Working Men's College, Great Ormond-street, on "History in Dress," showing how dress, in respect of materials, colours, style, and ornament, had been affected by exploration, conquest, trade, war, international relations, political partisanship, the diffusion of wealth, social distinctions, and the means of internal communication.

An east window, designed by Mr. G. F. Bodley, A.R.A., is about to be placed in the chancel of St. Paul's Church, Burton-on-Trent. It consists of large single figures of early English saints, and in the centre is the Holy Child in His mother's arms, surmounted by Our Lord enthroned in glory and encircled by the members of the angelic host. It will be ready for dedication at Easter. The present window has been presented to the parish church at Plumstead. It was inserted in St. Paul's Church at the time of the consecration, 21 years ago, and is not in harmony with the new reredos.

◆

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

FAMBRINI & DANIELS,
Manufacturers of IMPERISHABLE CONCRETE MASONRY for
CORNICES, STRING-COURSES, MODELLED PANELS, AND EVERY STONE-WORK REQUISITE.
LANDINGS and Plain or Moulded and Mitred STEPS, durable throughout.
WORKS AND OFFICES: LINCOLN.

DOULTING STONE.
CHARLES TRASK & SONS.
(THE DOULTING STONE COMPANY),

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Bermondsey, S.E.—The London School Board are erecting a new school in Page's-walk, Bermondsey, to provide accommodation for 1,174 children, and the following tenders have been received for providing and fixing a complete system of low-pressure hot-water apparatus for warming the building:—

Rosser and Russell	£688	0	0
Ellis, J. C., and J. S. (Limited) ...	549	10	0
Russell and Co.	537	10	0
Purcell and Nobbs	472	0	0
Jones and Attwood, Old Queen-street, Westminster (accepted) ...	458	0	0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2137.

FRIDAY, DECEMBER 20, 1895.

MISTAKES AND ABUSES.

IN one of his works, Oliver Wendell Holmes speaks of "one-story intellects, two-story intellects, and three-story intellects, with skylights," and he goes on to say that all fact-collectors who have no aim beyond their facts are "one-story men." And this is true of architects, amongst others. The "one-story" men are those whose only aim is to design a building upon simply commonplace principles, who make designs to satisfy the average public wants and tastes. The one-story man uses all those ordinary properties of plans and styles which seem never to pall on the popular taste—those ideas which have taken root because they are the least troublesome and save thought—and for a like reason he employs all those materials which modern manufacture has produced to obtain effect at the least cost. While there may be some good in buildings designed by these collectors of ideas and facts, they have, nevertheless, the fault of stereotyping plans and methods which are unsuitable and of perpetrating abuses. There are plenty of "one-story" men in the profession. They only take what comes readiest to hand—their facts consist in collecting plans or looking up buildings without discrimination. If they have to design a town-hall or a public library or public baths, they refer to the plans of buildings already built or competed for, and make use of such points or ideas in the plans as they think will suit them. We do not say they purposely copy, but they appropriate ideas which have cost their inventors many hours or days of thought, but which ideas may not always be adapted in other circumstances. To take a few instances of these mistakes. We are constantly meeting with plans of buildings which do not fulfil their intended purpose. A mistaken position of an apartment or an entrance, a wrong-shaped room, or a department a long distance away from its proper entrance are frequent. The corridor is pressed into all kinds of service for every sort of building, and is often a substitute for thought. When, for instance, we see it made to turn corners at oblique angles, badly lighted and narrow, it serves only to awaken our pity for the straits to which the designer has been put, and for the visitor who has to grope about to find the apartment he wants. There is one class of building where it seems to be thought indispensable—baths and washhouses. Those who have seen the designs for the Shoreditch Baths and Washhouses will be struck with the amazing ingenuity, or rather stupidity, which certain authors have shown in its application to a site hemmed in on the main entrance side, and which forms a neck to a large area of land within. No other expedient was thought of than to run a series of corridors through this contracted opening from the main street to the baths, and after passing the narrow neck-like space between old houses and the library block, make them diverge to the several doorways by twisting them, like so many indiarubber tubes, to their destination. Only one competitor has avoided this by making a quadrangle or court open to the street, from which the several entrances to the baths directly open, thus cutting short the length of corridors, and saving all twistings and contortions, besides making a pleasing architectural feature of the inner court. Thus by merely cutting off so many useless feet of corridors, the author obtains the same result at less cost. Circuitous corridors are always wasteful, and to a certain extent dangerous in public buildings where any of them are used as a means of egress from public assembly-rooms. Another lesson is learned from the same competition, as to the planning of entrances and exits to public halls for the easy dispersion of large assemblies of people. Not a few architects think that if a certain number of doors or staircases are placed on one side of a hall they are sufficient. Thus we find several plans which show three doors at one end as exits, and perhaps one or two staircases to the gallery at one end of the hall. This concentration of exits at one end or side is worse than useless as a relief, and may become dangerous should there be any panic. They should be distributed, and the only reasonable rule is to place them as far apart as possible, if they are confined to one side; or, better, to put them at opposite sides or ends of the hall. The staircases also should divide the gallery accommodation equally, and this can be done by placing them at both ends, or at alternate corners, so that the crowd can break up into two parts, one side and end gallery descending by one staircase, and the other side and end by the other staircase. By thus breaking up into portions the crowd of persons, ease and safety are insured. How many mistakes are made in the size and position of a doorway to a room. It is put in the centre of one side, at one corner, or just wherever the draughtsman likes to place it in reference to other parts, but without consulting the convenience or the necessary fittings of a room, exposing the occupants to gusts of cold air, or to the gaze of all those who enter the building or corridor. As to the position of a doorway to, say, a public hall or office, it should be central with the main approach if possible, or of sufficient size if in a corridor to give it importance. Generally we find a series of doors of similar size in a long corridor of a municipal building which are undistinguishable and confusing. Again, the public access to a building or a public hall should be direct: we should be able to approach it without having to make a number of circumambulations or circumflections round corners. The common mistake is to make the route from the street to the hall doors circuitous or indirect—a fault we find in nearly every competitive plan for a public building. It is a pity the architect does not study more the principles of what we may term obvious arrangement—that is, of shortening the routes between the main external entrance and the main hall; of making them so direct and obvious that no one can mistake them, thus obviating the frequent jostling of persons who take wrong routes. When a person goes to a public building and wants to find his way to the accountant's or sanitary office, or goes to take a bath, he should not be able to go wrong after entering the right entrance to the building. The corridor should be short, and lead him nowhere else, if possible, but to the particular department or room. There ought to be no mistaking the direction or the doorway; but somehow, when we enter a modern building of this kind, all is bewilderment; the principal doorways are perhaps in a corner, or round a corner, out of view, and some insignificant clerk's office or closet door is thrust into prominence. Then there is the window, which often seems made for the elevation, and not for the room it lights. It is either too large or wide, flooding the room with light in summer, and making it unendurably cold in winter; or too small, quite insufficient in area to light more than a few feet of the room, and without any relation to the depth or length of the apartment.

Let us look at the villa or private dwelling. It is often full of mistakes of one kind and another. Even our ordinary sitting-room or parlour is not designed for real comfort, but as a place to put fashionable furniture into, its size and shape being left to the accident of the plan—made in fact to fit in the plan, not designed for itself as a whole. The uncomfortable modern parlour one sees in suburban villas is the result of planning a space without any other intention than to make a room with window, fireplace, and door for holding certain conventional pieces of furniture. It is square or oblong, just as chance decides, lighted on one or two sides, entered by a door anywhere. Instead of which, the room should be designed to be interesting in itself, complete, if possible, with the least amount of furniture of the portable kind; large enough to live and sit about in, instead of being perpetually in a fidget that you are going to break something, or tread on someone's toes. And this ideal can only be obtained by having fewer and larger rooms, by making sometimes the hall a room for reception; but mainly by making all constructional features — like fireplaces, windows, and recesses—decorative as well, so that little furniture may be necessary to cover up bare walls and niggardly details. The average architect has not yet grasped the capabilities he has of turning what is essential and constructive to the best account. Even a handle, the latch, or the hinges of a door may be made something very different to what they are now. The mortise lock is hid in the stile or rail of the door, when really it may be turned into a decorative feature. So again the butts, which are buried in the rebates, as if there was a virtue in concealing the visible means of hinging, might be made ornamental. Window bays, recesses, firegrates, can all be turned to some decorative value instead of being plastered, painted over, or concealed by worthless ornament. The idea of the average architect, like that of the builder, is to provide so many rooms for others to decorate and furnish according to their several tastes; the object of the true designer ought to be to design each room for its intended purpose, and to make it as perfect and complete as possible, and to design everything for its place;—not, for instance, to plan a fireplace, and leave the ironmonger to fill it in, or the owner to select a pattern from a catalogue. The one good living-room ideal of the house is sacrificed to half-a-dozen small and uncomfortable rooms; the hall is reduced to the merest passage, instead of being what it once was—the common living-room or centre of the household life; and such fittings as the grate and the overmantel, instead of being designed for their places, are left to the taste of the furnisher or ironmonger. All these mistakes in modern buildings are largely owing to the custom of blindly following the public demand, to the existence in the profession of a large number of "one-story" men—men who are satisfied to supply the ordinary article without any effort to make plans of their own, or to use their brains.

An old adage tells us we may have "too much of a good thing," and it is just this surfeit of style or material which makes our modern buildings so lacking in character and substantiality. Many of them look like trade specimens—those model erections one sees at exhibitions, advertising Mr. Brown's tesselated tiles, Mr. Smith's decorative plaster, and Mr. Jones' fittings. Just now our public and commercial buildings are being turned into exhibitions of the manufacturers. On entering, we find the floors, walls, and ceilings covered by manufactured goods, tesselated pavings, "art faïence," Lincrusta, and a variety of other materials, each good and useful in its way, but sadly overdone. Even the columns or stanchions supporting girders or walls are covered with tile or terracotta slabs, the panelled walls are enriched by faïence decoration; the ceilings are decorated by Mr. Somebody's decoration, and the windows filled by stained glass. Not a square foot of plain wall or floor remains, the builder's work is all covered up, and one feels that we we have too much of the show-room. It is easy to step beyond the limit of useful adaptation. What may be tolerable in one situation may be abuse in another. Take, for example, the "art-tile" craze. At first it was employed in small decorative panels, to fireplace stoves, to wall panels; but now we find it used to cover the vestibules of restaurants, or to line the walls of shops, and even exteriors. The glazed brick, when confined to lavatories, bathrooms, and wherever light and a clean, washable surface are necessary, is reasonable; but we find whole buildings now lined with it. Glazed terracotta is also overdone in the same direction. A very common instance of abuse is to be noticed in stone-carving. No doubt well designed and artistically executed stone-carving in appropriate positions and points of interest add much to the decorative completeness of some buildings; yet we find it often carried to a riotous excess which is positively distasteful, as in the over-carving of keystone, door, and window, and the underneath surface of oriel corbels. Leaded stained-glass work, and other kinds of decoration, tolerable in themselves in their right place, are now so redundant in some of our modern shops and business premises as to become painfully obtrusive.

PROMISED PAYMENT FOR EXTRAS.

QUESTIONS of extras often turn on the final payment or certificate of the architect, and no doubt the granting of a certificate is the usual and reasonable course to establish any claim for extras; but the recent appeal from a judgment on a question of extras in the case of contractors against the Corporation of Huddersfield is instructive to contractors and public authorities, for one or two reasons. It may be of interest to consider the grounds on which the Court of Appeal dismissed the Corporation's appeal. As to the evidence. The contractors, in this case, were engaged to execute certain sewerage works for the Corporation of Huddersfield, and during the progress of the work, it appears, it was found necessary to tunnel through a mass of rock, which the plaintiffs naturally charged as an extra. The borough surveyor refused to make any allowance for this work on his own authority, but advised the contractors to apply to the health committee of the Corporation, and this committee gave them a promise (not in writing) that they should receive proper remuneration for the work. At the first trial the plaintiffs brought an action for the recovery of a balance of payment. By the agreement certain payments on account were to be made as the work proceeded, and the final payment made on the certificate of the surveyor. The plaintiffs relied, in the first place, upon an alleged certificate of the borough surveyor; but the jury found no such certificate had been given. Next they sought to establish their case on the word-of-mouth promise given by the committee, and on this issue the jury gave a verdict for the plaintiffs for the amount of balance. The Corporation, it seems, afterwards urged that judgment ought to be entered for them on two grounds:—First, that the contract relied upon by the plaintiffs was not under seal, and therefore not binding; and secondly, that by Section 200 of the Public Health Act, 1875, the committee could not enter into any contract to bind the Corporation. The judge who tried the case refused to entertain these points, as they had not been taken before verdict. Thereupon the Corporation appealed to have the verdict set aside for the above reasons; but, as we have seen, the Court dismissed the appeal, holding that they had urged the points too late. The decision, therefore, of the Court was founded on the verbal promises which the health committee had given the contractors—that they should receive remuneration for the extra work; but the question whether this promise was binding on the Corporation or not was not argued. The case, quite apart from the particular circumstances—which we do not know—is important in its lessons. Referring to the Public Health Act, Section 200 runs: "Every urban authority may from time to time appoint out of their own number so many persons as they may think fit for any purposes of this Act, which, in the opinion of such authority, would be better regulated and managed by means of a committee, provided that a committee so appointed shall in no case be authorised to borrow any money, to make any rate, or to *enter into any contract*, and shall be subject to any regulations and restrictions which may be imposed by the authority that formed it." The italics are ours.

The Act of 1848, Section 36, required the local board to approve of the acts of the committee, but there was a doubt as to the effect of this approval. This requisition is said to be now removed. Considerable powers have been granted to committees by local boards, such as paving streets, and it has been held that such acts did not require the statutory approval of the Council. Some legal authorities are doubtful, moreover, whether such approval is necessary in the case of a committee appointed for the purpose of this Act; and this and other decisions may be taken as showing it is not necessary. One important case may be cited to show that a contract entered into by a committee is binding on the Council, that of "Eaton v. Basker," in which it appears that a contract was entered into by a committee, and it was held that the Council were bound by the contract as having been made by their agents; but that as it was made with the committee collectively, and not with the members of it individually, the latter were not personally liable upon it.

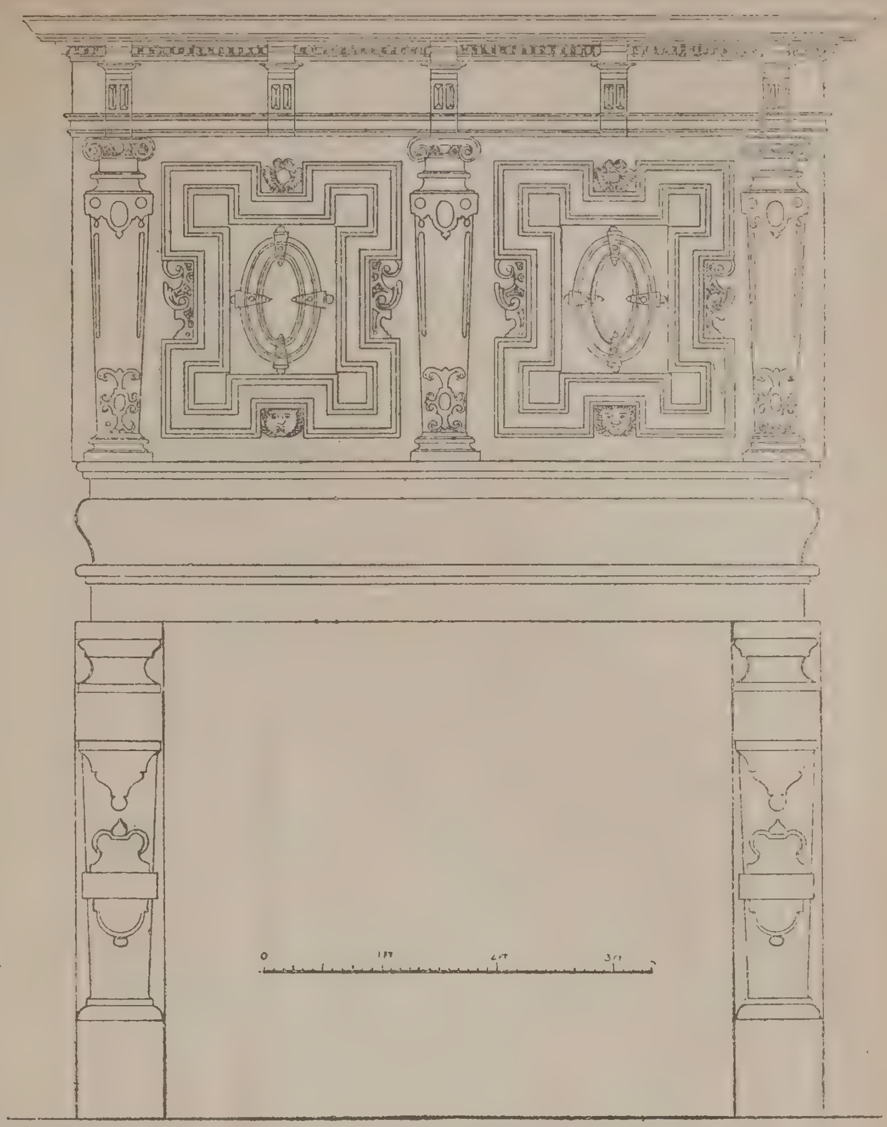
This decision appears to show that a committee as such can make a contract with a person that shall be binding on the corporation, notwithstanding the section in the Act we have quoted, that the committee are "not to enter into any contract." The decision in the Huddersfield case may be also said to confirm the opinion that a committee can make a contract, though in this particular instance the contract was merely a verbal one. We cannot be surprised at the ruling. A contractor encounters a considerable addition to his work, and applies to the surveyor, who, not willing to make an allowance on his own personal authority, refers him to the committee in charge of this particular contract, who give him a promise, though not in writing, that he shall be remunerated for any extra work incurred, and so the matter ends. No doubt the business-like way would have been to have pressed the committee for a written order for the extra work at the time; but contractors are not all so pressing. They rely upon the fairness of their employers in remunerating them for such extra work. The chief point to which we draw attention is the plea urged by the appellants, that by virtue of the Act the committee could not enter into any contract to bind the Corporation. If this were so, a contractor ought not to take any orders or instructions not confirmed by the corporate body, and in a large number of cases considerable delays in the carrying out of contract works would arise if the committee had not the power to enter into understandings with the contractor when emergencies arose. The decision will be of some practical use if it makes corporations more cognisant of their responsibilities, and contractors more particular in obtaining written orders.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting for the present session of the Institute was held on Monday evening. The President, Mr. F. C. Penrose, F.R.S., who occupied the chair, announced that by resolution of the Council the two following architects had ceased to be members of the Institute: Francis Drummond Greville Stanley, of Brisbane, Fellow; and George Poole, of Perth, Western Australia.

GRÆCO-PHŒNICIAN ARCHITECTURE IN CYPRUS, WITH SPECIAL REFERENCE TO THE ORIGIN AND DEVELOPMENT OF THE IONIC VOLUTE.

An exhaustive paper on this subject, illustrated by original drawings by the author and photographs, was read by Dr. Max Ohnefalsch-Richter, who described the excavations he had carried out during many years in the Island of Cyprus, and especially the three so-called "royal" tombs he had discovered near the ancient city of Tamassos. Dr. Richter admitted that he found no inscriptions to justify the title of "royal" given to the tombs, but he gave them that name on account of the beauty and finish of the masonry, their prominent position near the principal gate of the city, a former tribal capital, and the valuable objects he found in them, although they had all been rifled for treasure ages since. These sepulchres were of a Græco-Phœnician type of architecture, and although the presence of lime mortar joints at first seemed to indicate a later date, they were, he maintained, of the end of the 7th or beginning of the 6th century B.C. A feature of peculiar interest in these subterranean stone buildings was the direct imitation in stone of constructions of wood, and this in a perfection which had never before been met with in remains of ancient monuments. Wooden columns, windows, locks, bolts, roofs were all reproduced in stone, the blocks, especially in the roofs, being of colossal dimensions. He had found their counterparts surviving in modern buildings of Cypriote villages. One of the tombs contained weapons, helmets, plates, vessels of bronze and iron, a semi-globular drinking cup of silver, and a golden nail from an iron sword like those on the sword of Agamemnon. In different villages he had discovered modern capitals whose ornaments bore an astonishing resemblance to the ancient ones. Dr. Richter then proceeded to give in detail reasons for his conclusion that the Ionic volute was derived from the Egyptian lotus-flower design, and that the same origin was traceable in regard to the Greek palmette and anthemion. The theory which would ascribe the origin of the Ionic volute to the Assyrian sacred palm tree could no longer be maintained. A small clay model of a sanctuary—evidently a votive offering—recently discovered at Idalion, in Cyprus, actually showed the two lotus capitals on the columns supporting the porch. Some Hathor capitals discovered in Cyprus demonstrated the fact that Cyprian artists during the Græco-Phœnician period combined Egyptian, Assyrian, and Greek elements. On one of the columns was sculptured a design of a complicated lotus-tree with winged sphinxes. Dr. Richter next referred to an ingenious theory put forward by Herr Koldewey, a German architect, in his book "Neandria," distinguishing between three classes of archaic capitals with curved volutes—the first, with cross lines, the Cyprian; the second, with vertical volutes, called Æolian; and the third, with horizontal volutes, called Ionic. Those three he considered to be branches all growing out of the same trunk, which was of old Cappadocian origin, and which he declared to be the prototype. Herr Koldewey denied any connection of the Ionic capital with Egypt or the Egyptian lotus-flower. Herr Puchstein, in his book on the Ionic capital, appeared to be of the same way of thinking. The Cappadocian columns of a baldacchino from a rock relief which had been put in evidence by the above-mentioned authors were extremely simple. The whole volute merely consisted of two spirals connected by a canalis and bent downward. In the upper line of the canalis of this Cappadocian capital Koldewey saw the horizontal tendency of the Ionic volute to be latent. The two spirals touched the vertical line of the shaft of the column, and in this fact Koldewey saw the vertical tendency of the Ionic volute in the same Cappadocian capital. Dr. Richter, however, had found, during the excavations which he had carried out for the German Emperor, a small votive column even more regular and more simple than the Cappadocian column. The canalis above



CHIMNEYPIECE FROM AN OLD HOUSE IN LIME STREET, E.C. (About 1620 a.d.)
(Now in South Kensington Museum.)

was horizontal, and was covered already by an abacus. The spirals also touched the shaft with their inner and lower parts in a more finished and regular form than in the Cappadocian example. He maintained that the columns from Cappadocia, Cyprus, the oldest archaic Ionic volute from Uyra, Olympia, and other places were simplifications of much more complicated Græco-Phœnician volutes, which on their part derived from the Egyptian lotus. A reference to the architectural details of one of the three "Royal" tombs of Tamassos showed how a complicated lotus-bud design was changed into a more simple form, and thus prepared the way for the formation of the Hellenic Ionic volute. From a long series of Græco-Phœnician Cyprian capitals, with palmettes over the volutes, of which drawings were shown by Dr. Richter, he showed that the three types of capitals classified by Koldewey actually occurred in Cyprus. The Ionic volute, with its beautifully ornamented cymation, which belonged to the archaic Temple of Diana at Ephesus, and which had been lately pieced together by Dr. A. S. Murray from fragments in the British Museum, he fully admitted to be the oldest existing example of a pure Hellenic Greek volute. As a last illustration, Dr. Richter exhibited a photograph of an Ionic Greek capital now in the Cyprus Museum at Nicosia, and discovered at Larnaca in 1879. In this case, there was no ornamental cymation properly speaking. The sole decoration below the lower margin of the canalis and the spiral consisted of two palmettes or lotus-flowers growing out of the corners. The upper and lower margins of the canalis were not straight, but considerably concave, and both lines ran parallel to each other. The proportions of the capital were very harmonious and Greek, but it was difficult to date it. The concavity of the lines of the canalis seemed to point to a later date than the archaic Ephesian volute of the Artemisium.

Mr. George Aitchison, A.R.A., proposed a vote of thanks to the lecturer for his profound and instructive paper. His own theory as to the origin of the Ionic capital had been that it was derived from the spiral form of a univalve shell; but Dr. Richter's series of illustrations had established the fact that it was derived from a plant, either from the palm or lotus, and probably from the latter, although certain links in the chain of evidence were still missing. As to the presence of lime mortar in the joints of the masonry at the tombs of Tamassos, that was no argument against the antiquity of the work, for many years since the speaker had brought home, and had analysed, some mortar from the Great Pyramids, with the result that the mortar from the exterior was composed of lime and sand, and that from the interior of almost pure plaster of Paris.

Sir Henry E. Bulwer, G.C.M.G., High Commissioner of Cyprus during Mr. Richter's examinations, seconded the vote of thanks, remarking that the lecturer commenced his training in actual examination of the ruins, forming his own conclusions with a free and unbiased mind, afterwards studying up the subject in the museums of Germany, France, and England.

Mr. E. Falkener remarked that he had never seen an Ionic column in Egypt, although he discovered a Doric column in that country. Dr. Richter must have heard of the wonderful imitations of wooden forms in the rock tombs of Lycia, but, singularly enough, he had not even mentioned the name of the country in his lecture.

Mr. L. Alma-Tadema, R.A., said his independent studies led him to the conclusion that Cyprus was a land to which many outgrowing sprays of architecture spread and took root, especially Phœnician, but that it was not a country to which we might look for original development. He could not see his way to acceptance of the theory that the Ionic capital was developed under Cypriote influence, nor had Dr. Richter explained the difficulty that in all the drawings of Cyprian capitals the dominant lines of the rude Ionic capitals were aspiring and vertical, whereas in Hellenic work they were as undoubtedly horizontal.

Mr. R. Phene Spiers suggested that most of the Cypriote forms of ornament were derived, not from wooden originals, but from beaten metal.

Mr. Sidney Vacher could not follow whether the lecturer regarded the Cypriote forms of decoration as developed from an Egyptian or an Assyrian source.

The President, in closing the discussion, observed that while the origin and development of the Ionic capital could not be regarded as finally settled, yet Dr. Richter had brought forward some new points towards the solution of the problem. The wooden origin of this was suggested by the late James Fergusson in Part IV. of his "Ionic Architecture." Lime mortar was undoubtedly known to the ancients, for it had been found in the early work at Mycenæ. His own belief was that the latter was one of several sources from which the Ionic capital was developed, but certainly not the only one, and that it originated in a simple spiral, such as they found at Mycenæ. The volute could not have been erected from the helical windings of a shell, which were based on an equiangular spiral; whereas the Greek volute of the Ionic order was produced by a string coiled round a cylinder. Mr. Penrose then put the vote of thanks, which was carried by acclamation, and acknowledged by Dr. Richter.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XXI.—ENGLISH RENAISSANCE.—THE ELIZABETHAN PERIOD.

THE Renaissance first appeared in England at a time when the country was peculiarly ripe for change in architecture. The detestation in which the monks had been held, followed by the dissolution of the religious houses, disinclined the builders of the time, symbolising the newly-rising civil power as they did, to adopt the forms which in their minds had been closely associated with clerical supremacy. But the new forms which were to replace the Gothic had to filter to England by devious routes, the political circumstances of the time cutting us off from much communication with the Continent, and especially from Italy, its headquarters; and a transitional style was the result, full of coarse vigour, and wonderfully suggestive of a people thrown upon their own resources and founding an empire under most disadvantageous circumstances by sheer force of manful strength.

The great houses of this, the Elizabethan period, were planned somewhat upon the lines of Gothic fortresses, and in design they differed much, from dignified Wollaton, with its large windows, and its Orders superimposed in proper sequence—curious Orders, rich and coarse, like those of the later work at Heidelberg—to coarser Bramshill, and plain Knowle, this last with little to show that it belongs to the Renaissance at all, but with a square mass of masonry over the entrance gate, itself four-centred, having a long range of low buildings on either side, with dormers of contorted outline, such as are characteristic of the style in smaller domestic work.

Perhaps the greatest characteristic of the time was the absence of anything like refined proportion. Even in the smaller features, where this might be expected to be found, it is almost invariably absent. Take the Arlington Tomb, in the Rolls Chapel, as typical of numberless other similar monuments. In this the order, *per se*, is not particularly faulty, but the design is wrecked by the entablature being supported by ornament between the columns, and by the central pier being broken by the panel upon which the three kneeling children are carved—this last subversive of all harmony.

Ill-proportion is even more noticeable in the chimneypiece from Lime-street, in that the Doric Order, forming the mantel proper, is scarcely recognisable, with its bandings, its

(Now in South Kensington Museum)

small reversed ogee as an apology for a capital, and its large reversed ogee for a frieze; and the Ionic order is little better. But it is the utter want of any attempt to design with delicacy, the entire absence of refinement, in general scheme and in detail alike, which is so noticeable here and in all the thousands of examples which are to be found scattered up and down the country. The impression given is that of solid wealth and comfort, certainly; and so the style is frequently admired, and even loved, by English people, who often worship these things above all else; but there is little beauty in it.

KNOWLE HOUSE, KENT.

It is the same with the carving, when that is introduced, and it is something to be able to say in its praise that it suits its surroundings. Occasionally, however, it does more, particularly when, executed in wood, it consists of elaborate patterns in slightly raised bands. When anything further is attempted. it is apt to be a coarse travesty of the delicate Florentine or the Early French; but the evidence of wealth is always ostentatious in the outlines and curves, the brilliant colouring upon which so much depended in other lands being entirely absent, and the whole effect depending upon the forms wrought in the native wood or stone.

While freely criticising the Elizabethan, therefore, as examples of Classic detail, it is as Classic detail misunderstood rather than deliberately misapplied or deteriorated. The result is much the same as in the deteriorated German work; but the cause was different, and possibly it would have developed of itself into something much more admirable, had not the great Civil War occurred, causing a complete change in England's relations with other powers, and for a time stopping all building operations.

SHOREDITCH PUBLIC BATHS AND FREE LIBRARY.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

OWING to the generally expressed feeling of dissatisfaction with the award in this competition to which we referred last week, when we published the design placed first, the illustration today of the second prize scheme, by Mr. A. Hessell Tiltman, cannot fail to be interesting, though the author does not feel justified in printing detailed copies of his plans, which comprise some arrangements peculiar to himself as the result of personal experience. By the key-plan attached to the perspective view, it will be seen that the author has treated the problem, as far as the baths portion of the scheme is concerned, upon his well-

ARLINGTON'S TOMB, ROLLS CHAPEL.

RESTORATION HOUSE, ROCHESTER.

known quadrangle arrangement, as exemplified in two of his most recent buildings; and in the author's opinion this mode of treating the very numerous entrances of a public building of this character is really demanded by the exigencies of such a site, abutting, as it does, on to a thoroughfare so crowded as that of Pitfield street. Apart from the emergency exits from the first-class swimming-bath, and the entrance to the public washhouse, absolutely eight distinct entrances are required, and for the proper conduct of business "this necessary arrangement," Mr. Tiltman says, "is impossible by any other treatment of a site with so small a frontage as this." The quadrangle permits of the perfect localisation of all departments with their proper entrances and exits, and of an arrangement generally of great simplicity on plan, besides avoiding long and devious corridors (so difficult of management to those concerned when a large number of unruly boys are leaving) represents, so the author states, a saving of at least 50 per cent. in the superficial area of the collective corridor spaces. This has to be reckoned with in the structural cost of the buildings, involving, as it does nearly always, an expensive mode of roofing—viz., lead flats. The special entertainment entrances of the first-class swimming-bath are entered entirely from this quadrangle, whilst the exits open into Bowling Green-walk, which, from its narrowness, &c., is unfit for any other purpose. The Commissioners, by their own conditions, state that not only must the selected plan meet the requirements of the London County Council, *but that it will not be considered accepted until such sanction has been obtained.* Mr. Tiltman has called upon the Commissioners to carry this condition to its logical conclusion, by obtaining the sanction provisionally to the arrangement shown for this purpose *on the competition plans before they are altered, as now proposed,* and that, failing this test, Mr. Tiltman's plans should be subjected to the same ordeal. The accommodation furnished is "based upon the conditions, supplemented, however, by many important items of accommodation not recognised at all by the conditions, but which were regarded by the author of the design as absolutely essential to the establishment. The cost of this extra accommodation was more than compensated for by a reduction upon some of the extravagant heights, &c., required by the conditions, and by the *saving in the run of corridors* by the adoption of the quadrangle treatment of the plan." "Unless this modification had been made in the schedule of accommodation, it would have been impossible," Mr. Tiltman says, "to have carried out this (the baths portion of the scheme), constructed and finished as required for the amount named—viz., £30,000. The women's slipper-baths are arranged entirely on the first floor, over the drying-closet of the washhouse, and other portions that were equally low in height on the ground floor, so as to obviate any great height for the ascending staircase; and it is a distinct assertion of the architect that there are many advantages, and no material disadvantage, in placing all the women's slipper-baths on the first floor—a course, too, far preferable to spoiling the ground floor of establishments (as has been on several occasions done in London) by the unnecessary and persistent attempt to get *all* the slipper-baths upon one floor. The public washhouse is entered entirely from Coronet-street, and not through the quadrangle—a very desirable distinction and separation, and has over it on the second floor, but communicable by the staircase with the ground and basement floors. The Commissioners' board-room, clerk's office, and the superintendent's residence are all accommodated in the two floors over the arched entrances to the quadrangle facing Pitfield-street." In respect to his library plans Mr. Tiltman "has no remarks to make, except that he provides the accommodation asked for on two floors only, and that he does not believe the arrangement of it to be in any way equal to the baths portion of his scheme—a strong enough argument against the principle of giving *two equal premiums* to each of the successful competitors."

THE SOCIETY OF ARCHITECTS.

An ordinary meeting of the Society of Architects was held on Tuesday evening at St. James's Hall, Piccadilly; the President, Mr. Edwin J. Hamilton, in the chair. The following three new members were elected:—David MacBean, Office of Public Works, Glasgow; Hezekiah Mitchell, Topsham, Devon; and Frederick E. Simpson, 14, Park View-terrace, Heavitree, Exeter.

A YEAR'S WORKING OF THE LONDON BUILDING ACT, 1894.

The following paper was read by Mr. Ellis Marsland, honorary secretary, and district surveyor for Camberwell:—

It was my privilege a year ago to read a paper before the members of this Society giving a general description of the principal povisions of the new Building Act so far as it concerned us as architects. I then pointed out that considerable modifications and amendments had been made in the new measure since its introduction into Parliament as a Bill till its emergence as a complete Act for regulating the streets and buildings of the Metropolis. It was then a matter of speculation with me whether these modifications and amendments had produced a good and complete measure, or the conflicting interests at work against the Bill had been a case of too many cooks. In the few critical remarks I shall make this evening, I am afraid I must confess that the latter surmise has been the correct one, and in the words of Dr. Longstaff in his paper before the Architectural Association on the 22nd ultimo:—"It will probably be necessary to go to Parliament once more, not so much to strengthen the hands of the Council as to remove ambiguities or inconsistencies in the law which practice has brought to light. In some cases amendments introduced in committee by irresponsible opponents (and not always expressed in the clearest possible manner) lead to inconsistent or even absurd results, for it is an admitted defect of our legislative machinery that there is no means of redrafting a Bill after its emergence from committee so as to insure harmony in its several points." In my remarks this evening I make no pretentions to a complete critical analysis of the Act; but I wish to point out some defects which have occurred in my own practice, which will of necessity be directed more from my official position as district surveyor than from the standpoint of an architect. I shall make them as brief as I can, as I should wish as much time as possible left for the discussion, which, I trust, may afford architects an opportunity of stating their view of the case. I am free to admit that, in endeavouring to insist upon what was the intention of the new Act, the council and those responsible for seeing the Act enforced have up to the present not been very successful. This may be accounted for in some instances by the indiscreet surrenders those in charge of the Bill felt, in the interest of the safety of the measure, they were compelled to make, and the cases that have been taken into the law and police courts are, in the majority of instances, the result of ambiguity in the wording of the clause or section to which they refer. The difficulties and differences which have arisen are both legal and structural. One would have thought that with such an array of legal talent as was engaged upon the Bill it would have been possible that a legal distinction could have been made between a contract entered into by a builder for erecting a building and a building agreement taken up by a man who took so many acres of land and agreed to cover it with roads and houses in a certain number of years; but such, it appears, is not possible, and Section 212 (the interpretation of which, as now settled by the Law Courts, was farthest from the minds of the framers of the Act) allows houses erected in years to come to be carried out under the old Act if only a building agreement for their erection had been executed before the 25th August, 1894. This seems to me a most calamitous result for suburban house-building, looked at from a sanitary and structural point of view, for side by side we shall see houses being erected under the old Act, while those whose owners have been less fortunate as to the date of their building agreements will have to proceed under the new. This will be especially noticeable with respect to the open space in rear, thickness of walls, and a properly lighted and ventilated staircase. In Section 13, clause 5, which allows the re-erection of buildings that are now less than the prescribed distance from the centre of the roadway (provided the position of the old building has been certified by the district surveyor), seems to me to be a defect, as although no more land is to be occupied in the re-erection than was occupied by the old building, there is no restriction as to the height to which the newly-erected building may be carried, and whereas the old building may only have been one story in height, the new one may go to the extent of 80ft. Section 21, dealing with schools under the School Board the sites of which were acquired before the new Act came into operation, allows such schools to be completed under the old Act, yet it was only, I take it, intended that they should be exempted from the sections under Part II.—viz, the formation and widening of streets—as Section 21 comes within this division, or else the section is not in its correct position. In Part III., relating to lines of building frontage, I do not see that a very important section in the old Act has been re-enacted—viz., that giving the superintending architect power to deal with the frontage lines of buildings which abut upon more than one street. The old Section 33 in the General Powers Act, 1890, appears to have been repealed, and nothing substituted. Passing to Part V., which details the open space to be provided about buildings, I venture to think that it was a mistake for the council to exclude from the advantages of this division offices and counting-houses, as the occupants of such buildings pass a considerable portion of their time there, and the need of air and light seems essential to health; moreover, adjacent domestic buildings suffer if the whole of these sites can be covered with buildings perhaps of considerable height. Section 40 does not appear to answer the purpose for which it was intended. It is a section meant to provide light and air to habitable basements, but beyond the fact that a hundred square feet is to be provided in rear, it need not have any further relation to the habitable rooms supposed to be benefited thereby, and the concluding sentence, "which open space, notwithstanding anything hereinafter contained, need not necessarily adjoin the rear boundary of the premises," seems to be one of those interpolations inserted to appease some opponent, the meaning of which is not very apparent. Section 96 of the Public Health Act comes somewhat to the rescue, but that is a section that applies only when the building is occupied, and cannot be enforced during its construction. Section 41, detailing the amount of open space required for a domestic building upon a new site abutting upon a new road, seems, notwithstanding its somewhat complex character, to be working out so far as my experience goes in a satisfactory manner, and it is a great pity that the same conditions should not have been imposed upon a new site on an old road, instead of permitting the diagonal line to be drawn at a level of 16ft. above the pavement, and the open space to be also provided at this level, as this practically makes matters very little better than under the old Act. This Section 41, it may be observed, applies only to domestic buildings abutting upon a street; but what is to be done when a domestic building is to be erected upon a site that does not abut upon a street, is left to conjecture. Firstly, as to whether it can be erected at all, and secondly, what open space is required, as Section 42 only provides for the erection of dwelling houses to be inhabited by persons of the working class, upon sites not abutting upon a street. Under this section an important decision has been given, whereby a stable abutting upon a street is deemed a domestic building, and requires open space in rear; but had it not abutted upon a street, I fear no open space in rear could have been insisted upon. Section 43, dealing with a domestic building to be erected on an old site (where plans of the previously existing domestic building have to be certified by the district surveyor), states that such domestic building may be re-erected so that no more land shall be occupied by the newly-erected building than was occupied by the previously erected domestic building. Nothing is said as to the height, which may be anything up to 80ft. I find, on referring to the draft Bill, that it states "that the owner may then rebuild it to an extent and height not exceeding in any part the then dimensions so certified." This would have been, to my mind, reasonable; but I presume the Council had to give way on this point. In section 45, relating to courts within buildings inclosed on all sides, difficulty appears to have arisen in some cases in providing for the ventilation by means of a communication between the lower end of the court and the outer air, as it necessitates lowering the ceiling of a room on the ground floor, or raising the floor of the room immediately above it. The communication thus formed has a tendency to get choked up with rubbish, and is not very accessible for cleaning. Turning to Part VI., containing the sections relating to the construction of buildings, we find many points for controversy and many ambiguous clauses, some of which can be traced to the opposition. In section 54, dealing with recesses and openings in external walls, it recites such recesses and openings may be made *above* the ground story equal to half the whole area of the wall, but what is to be allowed *upon* the ground story is by no means clear, especially if your building is only one story high. It may mean you can have none, or have the building all open, which latter course will bring you into contact with the Schedule, which states every "building is to be inclosed with walls." This point has been a fruitful source of controversy in my experience. The only way out of the difficulty appears to me to apply to the superintending architect, who has in this particular case supreme power to decide the point at issue without any appeal to the Tribunal. Schedule 58 tells us practically that when a party-wall is built as a party-wall it shall be deemed to be a party-wall. What useful purpose this Section serves in the form we now have it I am unable to say. In the original draft of the Bill it was intended to prevent openings being made in the upper part of the wall dividing the buildings, one of which was higher than the other, but when the opposition defeated this idea, the whole Section had better been omitted. In its present form it means very little, or nothing, as the definition of a party-wall is fairly clear in Section 5, Sub-section 16. There seems to be a discrepancy between Sections 55 and 73 (4). The former restricts the frames of doors and windows of shops, if they are flush with the face of the wall to the ground story, whereas the latter fixes the limit of height to 25ft. This height would certainly embrace two stories, so that it is difficult to know which to follow. It is another of those instances in which a re-drafting would have insured harmony. What is required is that the following words be omitted from Section 55:—"and frames of doors and windows of shops on the ground story of any building." Section 74 causes to architects whose work is principally in commercial buildings a good deal of anxiety. It is the Section relating to a composite building used partly for purposes of trade and partly as a dwelling-house. The Section is very badly drafted, and is capable of varying interpretations. The problem to be solved is this:—If persons are living above the business portion of the premises, you must provide sufficient means of escape for them should the business portion be on fire. For this Section to come into operation the new building must exceed 1,000sq.ft.. It also comes into operation when two buildings are united and their united areas exceed this superficial area, and it is here where much difficulty arises. There are, of course, many hundreds of buildings which already infringe this new rule; but directly any addition, however small, is made the whole building comes within the scope of the Section, for Section 207 states:—"It shall not be lawful (unless with the consent of the Council) to make any alteration of any building in such manner that when so altered it will by reason of such alteration not be in conformity with the provisions of this Act applicable to new buildings." And, again, in Section 77, Sub-section 2:—"Buildings shall not be united; if, when so united and considered as one building only, they would not be in conformity with this Act." It is a mistake to suppose that this Section can be evaded by dividing your building up into divisions less than 1,000sq.ft., and putting iron doors to any openings that may be made in such divisions, as iron doors are only permissible for dividing warehouses into blocks of 250,000c.ft., or for dividing into blocks of this size the part used for trade. When once the united premises exceed the 1,000sq.ft. the rule has to be observed, and no number of iron doors will obviate fire-resisting separation of the trade portion from the dwelling-house; this, of course, means in many cases a large outlay. Now, of what is this division to consist? The section states it is to be by means of walls and floors of fire-resisting material; the thickness of neither is stated, but it may be inferred that inasmuch as the least thickness of a wall is 9in., that the vertical separation is to be this thickness; but district surveyors are not agreed upon this point. But what as to the horizontal separation, as neither the thickness nor the material is mentioned in the Section, but if we turn to the schedule of materials deemed to be fire-resisting, we find in clause 7, "That concrete composed of broken brick, stone chippings or ballast, and lime cement or calcined gypsum when used for filling in between joists of floors" is considered as such, but what interpretation are we to put upon the word "joists"—does it mean iron or wood? In my opinion, if it means the ordinary wood joists, the construction would be unsound, as the wood joists having no air-space around would have a tendency to go rotten, and would very soon bring about the collapse of the whole floor; then, again, no thickness is given, which might lead to a disagreement between the architect and district surveyor. Again, when is a fire-resisting staircase required? It appears from a recent decision that where you entirely separate the part used for purposes of trade from the dwelling-house portion by floors and walls of fire-resisting material, you need have no fire-resisting stairs. With all due respect to the learned magistrate who gave this decision, I venture to disagree with him on this ground, that he conceived the idea that a composite building within the meaning of this section contained only two elements—viz., the portion used for trade and the dwelling-house portion, and entirely overlooked the third element—viz., "all passages, staircase, and other means of approach," and came to the conclusion that the passages and staircases, &c., if not in the trade portion, must necessarily be in the other, and not a separate portion of the building. I think it essentially necessary that the staircase to the dwelling-house, and consequently from it, should be fire-resisting, in addition to the horizontal and vertical divisions, and the section, to my mind, states that it is to be so. For of what use is the vertical division with its doors in it if the doors are left open? (and there is nothing to oblige them to be kept shut). The fire would rush through these doors and possibly attack the staircase, if not of fire-resisting material, and render the escape of those above impossible, and thus defeat the obvious intention of the section. Another point of difficulty is with the doors in the vertical separation, which may be of 2in. teak or oak; but no mention is made of a frame or linings, and whether these are allowed, or the door is to be fitted to a rebate in the brickwork, is a moot point. I think I have shown some of the difficulties surrounding this section, and the direction in which—if it is to be of any practical value—it will require amendment. The intention of the section is good, and calculated to prevent the sacrifice of human life we have had formerly to deplore. The same difficulty as to the construction of the floors arises in the third clause of this section in buildings exceeding 2,500sq.ft. in area, and used as separate sets of chambers or offices. I may add that the new Act does not provide for the horizontal division of buildings of the warehouse class into sections of 250,000c.ft., which it was hoped it would. In Section 80, having reference to the construction of churches, chapels, public halls, &c., although the widths of the staircases, internal corridors, and passage ways are defined, no width for the entrances and exits is given. The doors and barriers are to be made to open outwards, and no outside locks or bolts are to be affixed thereto; but what manner of fastenings you may have is somewhat problematical. It would be a good thing, I think, if this section were allied to the regulations issued by the Council for the Construction of Theatres and Music-Halls, and I make it my practice to take these as my guide in dealing with public buildings generally, and more particularly for public halls, as I find it saves the owners considerable expense if they subsequently require to apply to the Council for a music license. One word with respect to exemptions from the operations of the Act contained in section 201. It must be borne in mind that all buildings, of whatever description and to whom they may belong, are the subject of notice to the district surveyor, or how else is he to ascertain that they comply with the conditions by reason of which they are exempted? and it must also be noted that they are only exempt from Parts VI. and VII. This implies that they are not exempt from the remaining parts of the Act, such as lines of frontage, open spaces, height, and the operations of the by-laws, all of which under section 138 come under supervision. I think a mistake has been made in exempting altogether the construction of detached greenhouses, without any restriction as to the distance away from any other building or the ground of any adjoining owner. A builder may now erect a large wooden greenhouse right up to his neighbour's boundary, and within an inch of any other building, with impunity, thereby largely adding to the risk of fire. A case came recently under my own observation, in which the back of a greenhouse some 9ft. or 10ft. high and 12ft. or 15ft. long was erected of matchboarding, and close up to the boundary of the adjoining land. If in this case the builder had been compelled to have executed this part in brickwork, he would, I think, have hesitated, and constructed more of it with sashes and glass, which, from an æsthetic point of view at least, would have been an advantage. I would also point out that exempted buildings are only exempt so long as they are used for the purpose or retain the character by reason whereof it is so exempt or privileged, so that you cannot build a greenhouse and subsequently use it as a billiard-room or workshop without incurring a penalty under Sections 200 (12) and 211 (4). I have endeavoured, somewhat imperfectly, I am afraid, to point out some of the defects and difficulties experienced in the working of the new Act, although a year's working is scarcely sufficient to test either its good points or its deficiencies; but I think we must give the London County Council credit for an earnest endeavour to provide a workable Building Act, as although some of its clauses are ambiguous owing to the large amount of opposition it encountered, yet I think the intention is clear; and it will, I feel sure, have the loyal support of the members of the Society of Architects, in order that it may be carried out in the spirit in which it was conceived.

Mr. Henry Lovegrove, as the most hard-worked district surveyor in the Metropolis, proposed a hearty vote of thanks to Mr. Marsland for his carefully prepared paper, which would be of the greatest value to his fellow officials and the profession generally. For himself, he found fault with the very title of the measure, and could not understand why it was to be cited as the "London" Building Act, instead of, like its predecessors, by the more correct name "Metropolitan." The term "London" had indeed replaced Metropolitan throughout the statute. He thought that the various sections relating to new streets and frontage were clear, and could be easily understood. Section 61, Sub-section 2, was an important piece of new legislation. It required access to be given to the roof in case of fire; but failed in one point, inasmuch as it did not define whether such provision of access was required in cases of alterations, or was demanded only in new buildings. Section 73, Sub-section 5, gave permission for the erection of bay windows, but said nothing about their construction, so that probably the portion above the sill might be wholly of wood. The requirement that parapets should be carried to a height of 3ft. in warehouse buildings above 30ft. high, was a very great improvement on the old Metropolitan Building Act; but it seemed absurd that parapets should be insisted upon between the roofs of adjoining w.c.'s, which were not buildings at all likely to take fire. The provision in Section 63 that every new building 60ft. in height and over should have means of escape in case of fire, was an excellent one. The district surveyor had now to ascertain, under Section 66, that there was a space of at least 18in. between the top of any oven and the floor above. Section 73, Sub-section 8, might well, he considered, have included some reference to lamps and other projections, which were now erected under the sanction of the vestry authorities. Some day there would be, he ventured to predict, a catastrophe caused by the giving way of one of the supports of these huge projections, and it could not be doubted that to leave them under the sole control of the vestries was a source of danger to the public. He fully concurred in all Mr. Marsland had said as to the slip-shod draughtsmanship and dubious interpretation of Section 74, relating to buildings used in part as dwellings and in part for trade purposes. His own experience was that this section was an extremely difficult one to work under in cases of alterations. In new buildings the architect was able to so plan the domestic portion as to be separated from the trade portion, as the section demanded; but in carrying out alterations, it seemed to need some definition as to the precise stage at which an alteration of the existing building was required. Sub-section 3 settled a disputed point as to the method of charging district surveyors' fees on buildings containing separate sets of chambers. Section 75 appeared to follow the decision in the case of "Holland and Hannen v. Wallen"; each portion of a warehouse building exceeding 250,000c.ft. must now be separated by party-walls, and not merely by a party structure. This seemed to be the meaning of the Act; he confessed that it was rather difficult to persuade architects that it was so. He had a case now before him, in which an architect wished to place on a site of limited extent a building containing three times the maximum area of 250,000c.ft., and proposed to circumvent the Act by dividing the structures by fire-resisting party-structure floors. The building would, of course, exceed the 60ft. limit of height, and he had informed the architect that such plans could not be passed except by the special sanction of the Tribunal of Appeal. Reverting to Section 13, clause 5, he agreed in the main with Mr. Marsland's criticisms, but thought it was very fair to the owner. He would point out that Section 21, dealing with the exemption of board schools from the Act, only affected the question of frontage lines. As Mr. Marsland had shown, section 40, relating to the light and ventilation of habitable basements, was very badly worded, and the next section, 41, referring to the space at the rear of domestic buildings, would render matters worse than under the old Act, for it enabled the owner to build over the space at the back to a height of 16ft. above the pavement. Sections 42 and 43 were very indefinite as to who were intended by the "working classes," and the assumption throughout the Act that a stable was a "domestic building" was very absurd. The rules as to recesses and openings in Section 54 were very good, and abolished some ludicrous arrangements previously adopted by knowing builders for burying brickwork in the foundations so as to comply with the old requirements, that the opening should not exceed one half the area. The reference to the part of building above ground story ought, however, to have been better defined. He could not but regret that the rules as to what were party-walls were based on the decision — an unwise one in his judgement—in the well-known case of "Williams v. Bull." If in two adjoining houses one was two stories higher than the other, commonsense demanded that the portion of the wall which separated the buildings should be regarded as a party-wall; but the upper portion, which merely inclosed the two upper floors of the loftier building, was no more than an external wall. He must repeat the warm thanks they all owed to Mr. Marsland for his well considered summary of the weak points revealed during the first year's operation of the new Act.

Professor Banister Fletcher, J.P., in seconding the motion, observed that their Society could not be better employed than in discussing such practical points among themselves as the subject of Mr. Marsland's interesting and valuable paper. As to the confusion which had arisen between a contract for building and a building agreement, he suggested to the framers of the Bill, when it was in committee, that they were wrong. As usual, they produced counsel's opinion to prove they were right; but within a month after the measure came into operation that counsel's opinion was shown to be mistaken. The application of a new restrictive Act should be, he contended, slow and gradual, and there should be no atttempt to interfere with private rights and arrangements made at great cost unless the public interests imperatively demanded such a change. The alterations made by the new Building Act, as compared with the one of forty years ago, were, after all, comparatively infinitesimal, and notwithstanding what Mr. Marsland had said, he was glad that the ambiguous point as to contracts and agreements had been so interpreted by the Courts as to protect owners of, and still more important, takers of, land partially built upon from altering their proposed arrangements. He did not agree with Mr. Marsland's interpretation of Section 13, Clause 5. He believed that the Act provided not only that in the reconstruction of old buildings no more land should be covered, but where the street was not 40ft. wide the new building could not be raised higher than the old one; it certainly could not be raised to the height of 80ft., as Mr. Marsland had asserted. As to the defects in Section 40, relating to new basements, no better provision to limit the use of basements could be required that was to be found in the Public Health (London) Act; the further requirement of the London Building Act was to provide an area of 100ft. square at the rear of the premises, "or contiguous thereto"—what the last three words meant he could not conceive. The new Act was, in regard to shop areas, a vast improvement on the old one, and got rid of many subterfuges to evade the verbiage of the Act. It was very difficult to understand why stables were treated as "domestic buildings" under the new Act in Section 42. A grave difficulty would occur in the future when a decision was required in a case where a man proposed to build a stable "not abutting upon a street," as such a case was not provided for under this section. Were such a point to come before him, he should reply that no man wanted to put up a building which did not front a street at some distance or other. It was to be regretted that there was no definite decision as to what constituted an old and what a new street, and the latest decision, "Perry v. London County Council," if supported, would relieve owners of land from giving notice in cases where hitherto it was thought necessary. There had been, unfortunately, contradictory decisions as to the legal definition of a street; but this was not to be wondered at when they considered the different standpoints of architects and lawyers. Lawyers were incapable of defining anything, but were ready to pick to pieces the definitions framed by practical architects. For example, the framers of the present Act, aided by expert architects, agreed on the definition of a building, but lawyers found it absolutely impossible to adopt the terms arrived at, or to suggest any others more acceptable; the consequence was that the House struck the clause absolutely out, and there was passed a Building Act containing no definition of a "building."

Mr. William Woodward supported the vote of thanks, and having referred to district surveyors' measure of control over public buildings, pressed Professor Fletcher for chapter and verse in the new Act for his interpretation of Section 13, clause 5, as to the restriction of the height of reconstructed buildings.

Professor Fletcher repeated that he believed the spirit of the Act was, that if a building in a street less than 40ft. in width were pulled down, it could not be raised in rebuilding to a greater height than the old structure; but he could not recollect off-hand the precise clause.

Mr. J. C. Jackson asked as to the meaning and extent of the restriction of the height of buildings in a street less than 50ft. wide laid out before August, 1862.

Mr. Philip Condy said there were many anomalies in the new Act which could only be rectified by an amending measure.

The vote of thanks having been passed by acclamation, Mr. Marsland replied, remarking that he utterly differed from Professor Fletcher in his interpretation of Clause 5 of Section 13; he read it that so long as new buildings did not exceed 80ft. in height, there was no restriction on adding to the height of buildings reconstructed in streets less than 50ft. in width laid out before August, 1862. It was quite true, as the professor had remarked, that regulations as to underground rooms existed in the Public Health (London) Act; but this only came into force when the rooms were already erected and occupied. It was a defect in the new Building Act that rooms in basements were not dealt with when originally planned. The Act was not clear as to the extent of shopfront areas. It was quite true, as Mr. Woodward had shown, that not a single building, whether erected by H.M. Office of Works or a railway company, was free from notice by the district surveyor; certain buildings were exempt from Sections 6 and 7, but not from other sections.

LONDON MASTER PLUMBERS' ASSOCIATION.

A MEETING of London master men, convened by the National Association of Master Plumbers, was held on Monday at the Westminster Town-hall, for the purpose of formally inaugurating a branch in the Metropolis. Mr. A. R. Marshall occupied the chair, and explained that the National Association was formed in Leeds in May of the present year. Branches had already been established in Manchester, Bolton, Leicester, Oldham, Halifax, Blackburn, York, Newcastle-on-Tyne, Hull, Bradford, Sheffield, and other provincial centres. The proposal to formally inaugurate a London branch was formally submitted, and was adopted unanimously. After some discussion as to what should be the objects of the London Association, it was eventually agreed that these should be (1) to raise generally the status of the plumbing trade; (2) to prevent, if possible, the great bulk of the contract work of the country being done at prices which are unremunerative; (3) to unite by a system of federation all master plumbers; (4) to mutually protect and honour each other, and so act generally in concert for the protection of the trade; (5) to support each other in cases of strikes or labour difficulties; (6) to confine plumbers' work to plumbers; and (7) to bring about improvements in the contracting system. The rules of the branch were next submitted and adopted with slight amendment. The election of officers was then proceeded with.

* * *

At the London Institution on Monday night a lecture on "The Old Norman Builders," illustrated by dissolving views, was delivered by Mr. Arnold B. Mitchell, A.R.I.B.A. Mr. Mitchell described the development of Norman architecture in our churches, pointing out that many of these were also built as the village fortresses—a condition retained by the tower of Warkworth Church to this day, and, in conclusion, advised those Londoners who wished to study a specimen of Norman simplicity to visit the church at Waltham Abbey.

In Shields-road, Heaton-on-Tyne, on Tuesday afternoon, the popular tragedian, Mr. F. R. Benson, laid the corner stone of a new building designed to serve as the Grand Theatre for the playgoers of Heaton and Byker. This new play-house will cost £13,000, will hold 2,500 people, and may be ready for opening at Eastertide next. Mr. William Hope, of Newcastle, is the architect, and Mr. S. F. Davison, of Heaton, the builder.

The London County Council, on Tuesday, empowered the engineer, Mr. A. R. Binnie, to obtain assistance in promoting an inquiry, with a view to the restoration of the Thames as a highway. In regard to the water-supply, the recommendations of the Parliamentary Committee were negatived, and the proposal that the Government should be asked to promote a measure for placing the entire control of the water-supply within the Metropolitan area in the hands of the Council, conjointly with the City Corporation, was carried by 56 against 43.

At the last meeting of the Liverpool Dock Board objection was raised to a proposal of the Works Committee to give notice to representatives of the timber trade to quit premises occupied by them on the east side of the Canada Dock in consequence of prospective dock improvements. It was complained that sufficient attention was not being paid to the wants of the timber trade. The chairman of the committee denied that the timber trade had been unfairly used, and the proposal was eventually adopted.

OBITUARY.

Mr. Benjamin Bucknall, architect, the friend and companion of Viollet-le-Duc, died at Algiers on November 16th, at an advanced age, from an attack of influenza. He had translated many of Viollet-le-Duc's principal works into English, and was his guest while the great French architect was rebuilding the Château of Pierrefonds for Napoleon III. Mr. Bucknall, who went to Algiers about 22 years ago in search of health, was so pleased with the country and his surroundings that he settled there permanently. "With singular knowledge and good taste," says a correspondent of the *Times*, "he adapted Moorish art to modern requirements, and the many beautiful villas in the neighbourhood of Algiers which he built or reconstructed for French, as well as for English, owners are very graphic evidences of his genius and good work. So successful was he that he was employed by wealthy natives as well as by Europeans. His funeral was so largely attended by persons of all nationalities and classes that it assumed almost a public character."

CHIPS.

The finance committee of Aberdeen Town Council have approved a draft Bill to be promoted in Parliament in the event of the council deciding to purchase the tramways. A valuation of the system is to be carried out.

The city council of Wells, Somerset, have resolved to make a final offer to the local gas company of £14,700 for the undertaking and plant.

On Thursday in last week a new Congregational chapel, recently erected at Wall Heath, near Kingswinford, was opened. The builder was Mr. Cave, and the architect Mr. Beck, both of Wolverhampton.

At the meeting of the Edinburgh Architectural Association, held at the Royal Institution in that city, on Wednesday night, a paper was read, illustrated by limelight views and photographs, by Mr. Thomas Arnold, A.R.I.B.A., of London, on "The Mausoleum at Halicarnassus." Dr. R. Rowand Anderson, the president, occupied the chair.

It is proposed to restore the tower of the parish church of Llangynllo, Radnorshire, from plans by Mr. F. R. Kempson, F.R.I.B.A., of Hereford. The church itself was restored in 1878, with the exception of the tower, which is now very dilapidated.

The guardians of Chorlton Union have adopted plans by Mr. J. B. Broadbent, of Princess-street, Manchester, for a group of cottage homes, with workshops, hospitals, and schools, to be erected by the board at Styal, Cheshire.

The Napoleonic Museum at Ajaccio is about to be enriched with a collection of paintings and various other curiosities relating to Napoleon I. They were bequeathed to the town of Ajaccio by the will of the late Baron Hippolyte Larrex.

The rural sanitary authority of Taunton have adopted an amended scheme by Mr. Hawkins, C.E., for the drainage of Somerton village, at an estimated cost of £1,500, exclusive of £450 to be paid for land at Barpool. The same authority are also arranging outworks of water-supply for Somerton.

The new hospital, Heywood, has been warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A group of public offices are about to be erected at Hunstanton, for the urban district council of that watering-place. Messrs. G. J. and F. W. Skipper, of Norwich, are the architects, and Mr. S. Hipwell, of Wisbech, is the contractor. The outlay will be a little over £2,000.

At a special meeting of Dunfermline Town Council, held on Friday, Mr. Andrew W. Bell, of the Office of Public Works, Glasgow, was appointed burgh engineer, master of works, sanitary inspector, &c., at a salary of £250 a year.

At the last meeting of the Leeds Corporation Waterworks Committee, the city engineer (Mr. Thomas Hewson) reported that the new 30in. main from Swinsty to Arthington was completed, with the result that there are now three gravitating mains between Swinsty and Eccup, and the total quantity of water which can be sent to Leeds without pumping at Arthington is over 18,000,000 gallons per day, the daily consumption at the present time being 14¼ million gallons.

The Bishop of Lincoln has unveiled a seven-light stained-glass window which has been erected above the reredos in the chancel of St. Leonard's Church, Newark. The window, which represents the Ascension of Our Lord, has been raised by public subscription, at a cost of £250. Mr. C. E. Tute, of Gray's Inn-square, W.C., was the artist.

COMPETITIONS.

Brownhills.—At the last meeting of the Brownhills Urban District Council, a report by Mr. Eayres, West Bromwich, the assessor, with reference to the competitive plans for the drainage of Walsall Wood was considered in committee. It was then decided to adopt the scheme by Mr. H. B Nicholls ("Forward"), Grosvenor Chambers, Corporation-street, Birmingham, by eight votes against four for Mr. H. W. Radford ("Gravitation"), Nottingham, who was awarded the second premium.

Christ Church Schools, Horsham.—On Wednesday last the appointment of quantity surveyors for the new school buildings in Sussex, of which Messrs. Aston Webb and Ingress Bell are the architects, was determined by the committee of the Governors. A large number of applications were, naturally enough, received from surveyors in all parts, as the cost of the works will be probably about £400,000. Three firms were finally selected for ultimate choice—viz., Messrs. Hunt and Steward, Mr. J. Gandy, and Messrs. Gardener, Son, and Theobald. The first-named firm, Messrs. Hunt and Steward, have been elected.

Coventry.—The city council received, on Tuesday, a report from the joint Estates and Finance and Watch Committees, respecting the plans for new municipal buildings, with reference to accommodation for the police, &c. After consultation with the architect, Mr. Quick, the committee recommended a rearrangement of the plans, which secured sufficient accommodation on a much less ambitious scale. The joint committees also submitted correspondence with the Home Office, showing the necessity of prompt measures being taken to prevent the loss of the Exchequer contribution to the cost of maintenance of the police. The Mayor moved the adoption of the report, and gave details of the accommodation proposed to to be provided, and Alderman Marriott seconded, stating that he estimated that the revised plans would result in a saving of something like £10,000. The question of the plans for municipal buildings generally, of course, stood over. After considerable discussion, in which Mr. Lee pointed out that they had paid large premiums for the best plans and then laid them aside for plans of their own making, the report was adopted, and full powers in the matter were delegated to the Watch Committee to submit the scheme to the Home Office for approval, and apply for the necessary borrowing powers.

Hetton-le-Hole.—In consequence of the dilapidated condition of the present church at Hetton, built 65 years ago, it was decided to rebuild it, and £1,200 having been promised towards the reconstruction, competitive designs were invited. Nine firms of architects sent in their plans, and the committee selected the designs of Mr. Stephen Piper, M.S.A., Westgate-road, Newcastle-on-Tyne. Mr. Piper's design is that of a simple Early English church, consisting of chancel, nave, north and south transepts, and narrow aisles, organ chamber, and side chapel, with a clergy vestry on the north side of chancel, and choir vestry at the west end of church. The accommodation is for 600, and the estimated cost £3,450, after taking into consideration the existing building material and seating.

Reading School Board.—The resolutions passed by the Board on June 12 and July 10, to obtain by competition plans for the school and buildings to be erected on the Swansea-road, were rescinded on the 11th inst., and it was decided that Mr. G. W. Webb, F.R.I.B.A., Market-place Chambers, Reading, be appointed to prepare plans, &c., for the new buildings. The schools are to accommodate 1,000 to 1,200 children on the classroom system, with central halls; also a cookery centre for 54 scholars, a manual instruction centre for teaching metal and woodwork, and playsheds for gymnastic apparatus, &c. The architect is also to report as to providing a swimming-bath in the basement of schools.

Welshpool.—The Governors of the County Intermediate Schools at Welshpool have intrusted Messrs. Woodhouse and Willoughby, architects and surveyors, of 100, King-street, Manchester, with the duty of assessing the competitive designs for their new school buildings.

* * *

A new mill, warehouse, and stables are about to be built at Congleton, Cheshire, from plans by Mr. John W. Rodger, of High-street, Cardiff.

OLD MASTERS ON THE CONTINENT: XXVIII.—"THE HOLY FAMILY," BY HANS MEMLINC.

"The Seven Joys of Mary," in the Old Pinakothek at Munich, the Madonnas at Antwerp, Florence, Bruges, and Madrid, and also the "Virgin and Child Enthroned," one of the two examples representing this great Flemish master in our National Gallery, are similar in many ways to the dignified and beautiful painting which we reproduce to-day from the Royal Gallery at Brussels, entitled "The Holy Family," but which might be described more correctly as a votive picture of the Virgin and Child with St. Anne, the donor, a monk, kneeling in prayer by the side of the sacred group, which forms so admirable a composition, and furnishes so appropriate an illustration on the eve of the festival of Christmas. Some account of the works of Hans Memlinc, written by Mr. Charles Eastlake, the Keeper and Secretary of the National Gallery, will be found in the Building News for Nov. 3, 1893, on which occasion we illustrated the painting of the "Virgin and Child Enthroned," already referred to. On the 1st of November of this year we gave another specimen of Memlinc's masterpieces, and we hope to give others shortly in this same series, which is being reproduced from magnificent photographs taken direct from the original paintings by Mr. Hanfstaengl, of Munich.

SHOREDITCH PUBLIC BATHS AND LIBRARY SECOND PREMIATED DESIGN.

(For description, see p. 880.)

NEW BATHS AND WASHHOUSES, KENNINGTON ROAD, S W.

This establishment of public baths and washhouses, for which tenders are to be sent in to-morrow, is to be erected at the corner of the Kennington and Lambeth roads by the Commissioners for Baths and Washhouses for the parish of Lambeth, and is the first of the series projected by them, and for which plans have been prepared by the architect of these buildings illustrated by us to-day—viz., Mr. A. Hessell Tiltman, F.R.I.B.A. The site is probably one of the finest that could be obtained in London for this purpose, and the extent of its two frontages enables a proper distribution and separation of the numerous entrances to the various departments; and, of more importance than all, it secures thereby a well-arranged series of entrances and exits to and from the men's first-class swimming-bath on the occasion of the latter being used for public entertainment, and thus with many other points of arrangement meets the requirements of the London County Council in respect of its license for the use of this part of the buildings for such purposes. The ground floor (as shown by the key-plan published), together with the first and basement-floor plans, provide the following accommodation:—Men's first-class swimming-bath, 143ft. by 57ft., with pond, the clear size of which is 132ft. by 40ft.; men's second-class ditto, 100ft. by 43ft., clear size of pond 90ft. by 30ft.; women's ditto, 65ft. by 41ft., clear size of pond 60ft. by 25ft. There will be 24 first-class slipper-baths for men and 39 second-class; 14 first-class slipper-baths for women and 17 second-class. There is room for the enlargement of all branches of the women's baths. The public washhouse will accommodate 64 washers, together with all the necessary accessory accommodation, and many new arrangements for the comfort and convenience of those using and governing this portion of the establishment as the outcome of the architect's special experience. The estimated cost of the establishment, including site, engineering, &c., will not exceed £55,000, and its author states that not only will it be the equal in size of another of his establishments already erected—viz., that at Hornsey-road, N. (the largest in England), but that it will have many improvements over it, in the shape of more suitable finish in every part, for the special avoidance of periodical repairs—an item of very great importance not even yet done justice to.

MERCHANT TAYLORS' SCHOOL—HEAD MASTER'S HOUSE.

This perspective shows the new buildings which have recently been erected for the Merchant Taylors' Company, for the head master of their school in Charterhouse-square, E.C. The buildings are faced with red brick, and Portland and Bath stone are largely employed in the windows and stringcourses. In the rear are two spacious dining-rooms for the boys, about 300 dining every day out of a total of 500 boys. The plan explains the general arrangement of the house, and there is a handsome oak staircase going up to the top story. The drawing-room is on the first floor, and the oriel window which is seen in the drawing gives a good view over the playground. The buildings have been carried out from the designs of Mr. W. Hilton Nash, F.R.I.B A., and the builders were Messrs. Dove Bros. The cost of the work was about £10,000.

NO. CXLIV. HIGH STREET, SOUTHAMPTON.

This curious and very ancient place of business dates from the time of the Normans, who, 800 years ago, constructed the barrel-vaulted cellar (under the front shop) to store wine in, which purpose it fulfils to day. In the stonework many rings and hooks of old Hampshire iron remain, and throughout the premises tiles, pottery, and coins of various dates have been discovered. The well marked A on plan is steined with worked stone. In designing the new portions the irregularities of the site, instead of being "squared off" were pressed into service, and now form useful recesses, spanned by the curb of an octagonal roof. The whole of the timber is unvarnished pitch-pine, the dado of red and white deal, and the fireplace of red Mansfield and Caen stone. An old bakehouse has been converted into a kitchen, between which and the dining-hall is a ventilated chamber containing the grill. Messrs. H. Stevens and Co. have carried out the work for the owner, Mr. G. B. Cundell, under the supervision of the architect, Mr. R. M. D. Lucas, at a cost of about £600.

FONT CANOPY, ST. PETER'S, LONDON DOCKS.

This richly-sculptured, spire-shaped canopy shown by the architect's detail drawing, which is reproduced herewith to-day, was lately executed by Messrs. Farmer and Brindley, the elaborately-treated metal-work hoist having been carried out in wrought iron. The sculptured statues in the niches round the octagonal body of the cover represent:—1, "Noah, with the Ark and Dove," foreshadowing Redemption; 2, "Moses with the Two Tables of the Law," recalling the Passage through the Red Sea, a figure of the Waters of Baptism; 3, "St. John the Baptist," bearing the *Agnus Dei*, and wearing his garment of camel's hair; 4, "St. Peter with the Keys," the patron saint of the parish; 6, "St. George and the Dragon," the heroic martyr of Nicomedia, A.D. 285, and patron of St. George's-in-the-East, in the old parish of which the mission of St. Peter's, London Docks, largely extends; 7, St. Charles Borromeo, born Oct. 2, 1538, died Nov. 3, 1584, Archbishop of Milan and Cardinal, after whose name the founder of St. Peter's, Old Gravel Lane, Charles Lowder, was christened; 8, "St. Vincent de Paul," leading a child. He was the founder of the "Order of Lazarites," or "Fathers of the Mission," in Paris, 1642, and the "Order of Sisters of Charity" in 1655, five years before his death at the advanced age of 84. The cover is surmounted by a *Pelican in her Piety*. The red spot at the end of the bird's beak having led people to suppose that while preening its feathers it was feeding its young with its own blood originated the use of the Pelican as a beautiful symbol of Him who in like way sustains the Church in the Sacrament. The figures of the Evangelists on the stone shaft supporting the oaken beam of the font's cover-hoist were carved by Mr. Nathaniel Hitch from the architect's full-size drawings. The same artist sculptured the kneeling statue of an angel at the foot of the staircase leading round the baptistery to the west gallery of the church. A view of this building appeared in our pages for May 11, 1894, from the Royal Academy drawing of the architect, Mr. Maurice B. Adams, F.R.I.B.A.

CHIPS.

The Edinburgh and Leith Water Trust have appointed Mr. Jervis, who was formerly in charge during the construction of the Moorfoot works, as chief inspector of the Talla works of water supply, at a salary of £300 per annum.

In last Saturday's issue of *La Construction Moderne* an article is devoted to the description of the Passmore Edwards Public Library at Hammersmith, and accompanying it a reproduction is given of the Royal Academy drawing of the building, exhibited this year by the architect, Mr. Maurice B. Adams.

The Shoreditch Public Library in Kingsland-road is about to be considerably enlarged at the cost of Mr. J. Passmore Edwards, who presented the original building to the parish a year or two since, when it was opened by the Duke of Devonshire. The new façade is to be in Portland ashlar with cornices and pediments. The architect nominated by the commissioners, and appointed by the donor, for the work is Mr. Maurice B. Adams, F.R.I.B.A.

At University College, Gower-street, on Monday, Professor Bonney, the well-known geologist, was presented with a portrait of himself painted by Mr. Trevor Haddon, and subscribed by past and present students at the College and at Cambridge University.

The work of demolishing the first block of eight houses in Poets'-corner and Old Palace-yard, Westminster, was commenced on Tuesday. This clearance, which is being carried out by H.M. Commissioners of Works, will provide a much-needed open space on the north-east of the Abbey Chapter House and Henry VII.'s Chapel, and this will, for the present at any rate, be laid down with turf.

The foundation-stone of a new branch Jewish Synagogue, to be erected in Lauderdale-road, Sutherland-avenue, Paddington, was laid on Sunday afternoon by Mr. Sebag Montefiore. Messrs. Davis and Emanuel, the architects, are described in the official document placed under the stone as the "designers of designs." Messrs. S. J. Jerrard and Sons are the builders.

At the Audit House, Southampton, on Wednesday week, Major-General H. D. Crozier, R.E., held an inquiry on behalf of the Local Government Board into the application of the Southampton Corporation for sanction to borrow £6,000 for covering in the two revervoirs on the Common, at present open, and holding about six million gallons. Mr. W. Matthews, waterworks engineer to the corporation, explained the proposal. Further applications were made on behalf of the corporation for sanction to borrow £4,000 for laying an 18in. cast-iron intercepting sewer from Simnel-street to the Town Quay, and sums of £545 and £475 for improvements in Bedford-place and Blechynden-terrace.

The town council of Dunbar decided on Friday to expend £2,000 in supplementing the supply of water with some to be drawn from the Cold Burn, above Pathhead.

In the case of Edgar Charles Newby (late tradin as E. C. Newby and Co.), Cardiff, contractor, the discharge from bankruptcy has been suspended for three years and six months, ending April 3, 1899.

The Watford Urban District Council having applied to the Local Government Board for sanction to borrow £900, for the erection of a new council chamber, an inquiry was held by Mr. John Ord Hasted, one of the Local Government Board inspectors, at Upton House, on Friday. The clerk to the urban council explained that the contract for building had been entered into by Mr. Eames for £580, the architect's commission and expenses were estimated at £40, and £280 would be required for furniture and fittings.

Building Intelligence.

Birkenhead.—The new fire station, which has been erected for the Birkenhead Fire Brigade in Borough-road, was formally opened on Tuesday. The buildings comprise the fire-station proper, with superintendent's house, engineer's house, and quarters for twelve single men. The engine-house fronts to Whetstone-lane, and has accommodation for two steamers and a tender, all of which can be taken out direct by means of three large folding-doors opening on to the road. Adjoining are a recreation-room, duty-room, and superintendent's office. The buildings have been erected from the designs and under the superintendence of the borough engineer, Mr. Charles Brownridge, A.M.Inst.C.E., Mr. James Merritt, of Marion-street, being the contractor.

Gateshead.—The foundation-stone of the new church of St. George, Durham-road, Gateshead, was laid on Monday by Lord Northbourne. The building, which is a simple treatment of 13th-century style, is being erected at a cost of £5,900, including the tower. The accommodation is for 630 adults. The church consists of chancel, nave, north and south transepts and aisles, and organ chamber, with choir and clergy vestries on the south side. The latter are arranged so that they may be used as one room for meetings, and have an entrance from Inskip-terrace. The nave is 27ft. wide and 49ft. high to the ridge. It is divided into five bays, with narrow aisles, and without a clerestory, an arcading of high pitched arches being thus obtained. There are three entrances, the principal being at the south-west angle, through the tower. The exterior walling is of local stone, sneck-faced, and the interior piers and arches are of stone, chisel dressed, the general finishing being plaster with a cleated dado. The floors of the nave will be of wood, with wood-block flooring in the passages. The floor of the chancel will be covered with encaustic tiles. The windows will be filled with tinted cathedral glass in leaded lights; and the heating is to be by hot water, on the low-pressure system. Mr. Stephen Piper, M.S.A., 52, Westgate-road, Newcastle-on-Tyne, is the architect, his plans having been selected in a limited competition, in which Mr. W. Walton-Wilson, F.R.I.B.A., was the assessor. The contractor is Mr. Alexander Pringle, of Gateshead, and Mr. Richley is acting as clerk of the works. It is expected that the building will be completed next autumn.

* * *

New works of water supply are about to be carried out for Wargrave and Twyford, Berks, from plans by, and under the superintendence of, Mr. A. Marshall, C.E., of Swadlincote. The contract has been taken by Mr. M. S. Kitteringham, of Enfield, at £4,240.

The Liverpool School Board have assented to the inclusion in its contracts of a clause binding contractors to pay the current wages and observe the recognised hours.

A Local Government Board inquiry was held at Harrogate on Tuesday as to an application by the corporation for sanction to borrow £27,000 for the purposes of electric lighting; £4,000 for the construction of new storage reservoirs for surplus water; £1,500 for the provision of underground conveniences on the Stray; £1,050 for works of storm-water overflow, the covering of a water-course, and the erection of a shed for mixing asphalte; and £150 for the provision of conveniences at the Victoria Baths.

Colonel G. T. Plunkett, late Royal Engineers, has been appointed by the Lord President of the Council to the Directorship of the Science and Art Institutions in Dublin. In this capacity he will have the same administrative control of the Science and Art Museum, the Metropolitan School of Art, the Botanic Gardens, and the National Library, as the late Director, Dr. Valentine Ball, C.B., and at the same time will be responsible for the duties at present connected with the office of secretary to the Royal College of Science, which post Colonel Plunkett has hitherto held.

The Chester Town Council had before it, on Friday, a proposal for the erection of a new high-level bridge over the Dee, to connect the city and the residential district of Queen's-park. The plans, prepared by Mr. Beswick, show a structure in two spans of 212ft. and 160ft. respectively, and 27ft. in width, running from St. John's Churchyard to the Queen's Park Estate, and the estimated cost is £11,500, towards which £5,000 and the land on the estate abutment would be provided by the residents in that suburb. The matter was referred to a sub-committee.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

York Architectural Society.—The council of this society, in their thirteenth annual report, state that the total number of members on the roll is 58, being an increase of three since the last report was issued. Six new members have been elected, and three have left the city. Papers were read during the session by Messrs. H. W. Chubb, of London; F. W. Bedford, of Leeds; J. W. Longfield, London; John Lane, and N. R. Yeomans, and excursions were made to Tadcaster, Pickering, and the city sewerage works at Fulford and Naburn. The treasurer's report shows a balance in hand of £37 18s. The following are the arrangements for the present session:—Jan. 10 (Friday), Annual Social Gathering and distribution of prizes; Jan. 30 (Thursday), lecture, "The Mediæval Manor House," by Mr. Francis W. Bedford, A.R.I.B.A., Leeds; Feb. 14 (Friday), lecture, "The Ventilation of Buildings," by Mr. A. H. Claypoole, A.M.I.C.E., York; March, lecture, "To Ancient Rome," by Mr. G. Bertram Bulmer, F.R.I.B.A., Leeds; March 27 (Friday), lecture, "Old York," by Mr. George Benson, York.

Glasgow Architectural Association.—A lecture was delivered in the rooms, on Tuesday, by Mr. James A. Morris, F.R.I.B.A., architect, Ayr. Subject, "Architecture: What is it?" the President, Mr. A. N. Paterson, M.A., in the chair. Reference was made by the chairman to the loss the association had sustained in the death of Mr. Thomas Gildard, hon. member and past hon. president of the association. Mr. Morris then said that the general acceptation of architecture was the art of building or construction. Now, while this may be accepted as an undoubtedly popular definition, it seemed to the lecturer that one might quite as accurately define poetry as the art of grammar; for if a knowledge of building or constructing is to make a man an architect, it may be quite as reasonably argued, that a knowledge of grammar will make a man a poet; a contention as unreasonable as it is absurd. An architect should undoubtedly realise his architectural conceptions by the aid of good materials and sound construction; but it does not follow that a knowledge of these two last-named sciences must of necessity make one an architect. When, then, is architecture, considered as a fine art, as it is, and not merely as utilitarian in its aims and end? It will be well, he urged, if we accept architecture as something serious, something ennobling, existing in the same high world as poetry and music and the sister arts. If a man knows or cares nothing for this spirit in art, this ideal, then is the man no true artist; and if he has this spirit, let it be ever so feeble a spark, and does not submit to it, and walk up to it, then is he no true man. Is it uncharitable to think that this is surely different from the spirit in which much of our modern work is carried out; this, wherein some deem to run architecture as they would a commercial business, the end and aim of which appears to be to get increase of work, and thereby money? As an almost invariable rule, and one with few exceptions, the biggest businesses in the architectural world, and those in which architectural fortunes are made, are precisely those run on purely commercial principles; and those are the businesses in which the architectural quality of the work is nearly always in the inverse ratio to the amount of work done. And why? Is it not through press of business the principal often degenerates into the office feeder, bringing grist to the mill, and leaving it to a more or less competent staff to attend to its grinding? What is architecture is as yet unanswered, and no one can define it for you in words. If, however, we have eyes to see, and the power to understand what we see, we will find an abundant answer in every line of a Greek temple, in every stone of a Mediæval church, and in all work that is high in aspiration, noble in conception, and true in itself. A large number of lantern slides were shown, illustrating the lecture, and at the close Mr. Morris was awarded a hearty vote of thanks from a crowded audience for his able and interesting lecture.

Bristol Society of Architects.—At the ordinary monthly meeting of this society, held at the Fine Arts Academy last week, a paper entitled "The Temples and Buildings of Ancient Greece as we see them To-day," with personal notes from Greece, Sicily, and South Italy, was read by Mr. Mowbray Aston Green, A.R.I.B.A. A description was given of the origin, history, and progress of the style and contemporary arts, and the paper was admirably illustrated by photographs of the best examples of temples, theatres, and other buildings, and of sculpture and mural paintings, which were exhibited by limelight. A discussion followed the reading of the paper, and at its close a vote of thanks was unanimously accorded to Mr. Green for his address.

CHIPS.

The rural district council of King's Norton have raised the salary of Mr. Webb, the assistant surveyor, from £156 to £250 a year.

A special meeting of the Belfast Corporation has been held for the purpose of specially authorising the Bill in Parliament for the extension of the city boundary. Deputations from outlying districts objected that the measure was premature and too sweeping, but the Bill was approved by a large majority.

A Roman Catholic church, erected from designs by Messrs. Pugin and Pugin, Westminster, at a cost of about £3,000, was opened at Morecambe on the 12th inst. by the Right Rev. Dr. Whiteside, Bishop of Liverpool. The edifice is in the Early Decorated style, built of brick, with facings of Yorkshire pierpoints and dressings of Whittle stone, and will seat about 250 persons.

A new Presbyterian church at Craigie, Perth, was opened on the 12th inst. The church has been erected at a cost of £4,000. Sitting accommodation has been provided for over 500, but by the addition of transepts the building will ultimately be enlarged so as to accommodate 800.

The town council of Great Yarmouth have received eight tenders for the erection of a refuse destructor, varying in amount from £7,802 to £12,769. A committee has been appointed to advise as to the best form of destructor to adopt.

Mrs. Warde-Aldam, who recently restored Hooton Pagnell Church, at a cost of £6,000, has presented to the same church a set of chimes and clock, costing £600.

The chief engineers for the construction of the Mombasa-Uganda Railway (670 miles in length), Messrs. Anderson, Napier, and John, with several assistant engineers and a small staff, have now arrived at Mombasa from England. The preparations for the starting of the railway works have already been taken in hand, and a small railway plant has now arrived, and will be laid down as soon as possible.

The new Town-hall and Municipal Buildings at Croydon will be formally opened by the Prince and Princess of Wales in May or June next. The group of buildings has been erected on the site of the former Central Station from plans by Mr. Charles Henman, A.R.I.B.A., of Cannon-street, E.C., whose design, as selected in competition, was given in our issue of June 3, 1892.

The Paisley Town Council having agreed to convert the Quarry Park, which they purchased from the Road Trustees at a cost of £4,000, into a public park, have now decided to spend about £1,200 on the levelling of the ground and the erection of wall and railings.

The death of Mr. John Smythe, J.P., of Maidstone, occurred on Saturday night after a prolonged illness. Deceased, who was 70 years of age, was head of the firm of Messrs. J. and A. S. Smythe, timber merchants, in that borough.

Under the will of the late Philip H. Rathbone, an alderman of Liverpool, the permanent collection of art works in the Walker Art Gallery of the city will be enriched by a gift of eight valuable pictures. Six of the works are by Italian artists, the largest being by Ghirlandajo, and the majority were painted in the 16th or 17th century by painters whose identity it is difficult to establish. The seventh picture is by the late Albert Moore, R.W.S., and the other is a copy of the Sistine "Madonna and Child," by Raphael. These pictures will remain at Greenbank Cottage during Mrs. Rathbone's lifetime, and afterwards will be handed over to the trust of the Liverpool Corporation.

The eighth annual dinner of the North-Western Sanitary Inspectors' Association was held in Liverpool on Saturday, when it was stated that the association had, since its inauguration, steadily progressed, and now had a membership of 120, representing 50 urban and public health authorities.

The new chimney which has been built at the Royal Infirmary, Edinburgh, at a cost of about £2,000, from designs by Messrs. Sydney Mitchell and Wilson, being now completed, was inspected on Friday by the House Committee. It is 180ft. high, 16ft. in diameter, and 3½ft. thick at the base, and it diminishes to 8in. at the top. In its construction about 200,000 hard red bricks have been used, as also 2,500c.ft. of Hailes pink stone. The whole weight of the material in the structure amounts to about 2,000 tons. Messrs. Bruce and Sons, of Greenside, were the contractors.

NOTES ON APPROXIMATE ESTIMATES.*

CIVIL BUILDINGS, WORKS, &c.—(*Continued.*)

	Average Cost.		
	Per foot cube.	Persquare of 100ft. super.	Per unit.
201. Sheds, Iron. Closed. Height, 8ft. from floor to eaves. Roof and walls of corrugated sheet-iron; iron roof trusses; concrete floor.	2½d.	£17 0 0	—
202. Sheds. Wagon or cart	4d.	—	—
203. Shelter, Cabmen's. 16ft. by 10ft., and 8ft. high to eaves	—	—	£150 each
204. Shops. Suburban, with dwelling attached	7d.	—	—
205. Shops. (See "Workshops.")	—	—	—
206. Sinks, Housemaids. Stoneware, complete with waste, &c., but exclusive of water-supply	—	—	£6 each
207. Sinks, Scullery. Complete with bracket, waste, &c., but exclusive of water-supply	—	—	£4 each
208. Skittle Alley, complete...	6½d.	—	£200 each
209. Smithery, complete	6⅓d.	—	—
210. Stables (first class)	10d.	—	£150 per stall
211. Stables (second class)	8d.	—	£100 per stall
212. Stables (third class)	6d.	—	£60 per stall
213. Stable Fitments for stalls, complete, including iron ramp and sill, filled in with 1½in. deal V-jointed matchboarding, iron heel-post, manger, hayrack, head and heel chains, halter rings, &c., 1st class	—	—	£16 per horse
214. Stable Fitments. Ditto ditto, 2nd class..................	—	—	£10 per horse
215. Stable Fitments. Ditto ditto, 3rd class	—	—	£7 per horse
216. Stable Fitments. Ditto for loose boxes, including door, fastenings, &c., 1st class	—	—	£20 per loose box
217. Stable Fitments. Ditto ditto, 2nd class	—	—	£12 per loose box
218. Stable Fitments. Ditto ditto, 3rd class	—	—	£9 per loose box
219. Stable Paving. Comprising 2½in. granite concrete paving, laid on 4in. p c. concrete, with 6in. of broken brick rubbish under, including finished surface with all falls, grooves, channels, &c......................	—	£6 0 0	11s. per yard super. or £6 12s. per horse.
220. Staircases, Iron Circular. Complete, including fixing, 3ft. 6in. diameter..............	—	—	14s. per step, or £1 1s. per ft. in height
221. Staircases. Ditto, ditto, 4ft. 6in. diameter...............	—	—	18s. per step, or £1 7s. per ft. in height
222. Staircases. Ditto, ditto, 6ft. diameter	—	—	25s. per step, or £2 2s. per ft. in height
223. Staircases, Iron, Straight, Complete, including string and handrail on each side, 3ft. wide	—	—	£2 per step, or £3 6s. per ft. in height
224. Staircases. Ditto, ditto, 4ft. wide	—	—	£2 5s. per step, or £3 8s. per ft. in height
225. Staircases, Stone. Spandrel steps, including handrail, balusters, &c. 3ft. 6in. wide	—	—	£2 2s. per step, or £3 12s. per foot in height.
226. Staircases. Ditto, ditto. 4ft. 6in. wide......................	—	—	£2 12s. per step, or £4 10s. per foot in height.
227. Staircases, Wood. Deal risers, treads, strings, and balusters, with mahogany handrail, newel, &c., complete. 3ft. wide	—	—	15s. per step, or 25s. per foot in height.
228. Staircases. Ditto, ditto. 4ft. wide	—	—	20s. per step, or 34s. per foot in height.
229. Staircases. Ditto, but with deal risers, cut and mitred string, mahogany handrail, newel, &c., complete. 3ft. 6in. wide	—	—	30s. per step, or 50s. per foot in height.
230. Staircases. Ditto, ditto. 4ft. 6in. wide......................	—	—	38s. per step, or 65s. per foot in height.
231. Stores. (See "Warehouses")	—	—	—
232. Straw Stores	2½d.	£28 0 0	—
(Height from floor to eaves 12ft.)			
233. Tanks. Cast Iron, fixed complete, including wood cover, &c., but exclusive of water supply, capacity 3,500 gallons..................................	—	—	£56 each
234. Tanks. Ditto, ditto, 5,000 gallons..................................	—	—	£75 each
235. Tanks. Ditto, ditto, 10,000 gallons.........	—	—	£110 each
236. Tanks. Underground. Complete with concrete walls, bottom and roof, including digging in clay, gravel, and similar formations	1s.	—	2d. per gal.
237. Tar Macadam. For roads, formed with 3in. of 1½in. granite mixed with 12 gallons of tar, ½cwt. of pitch, and two gallons of creosote to every ton of granite, well rolled, and covered with granite chippings 1in. thick, mixed with tar, &c., as before. The whole to be then dusted with dry limestone chippings and rolled	—	£2 15	5s. per yard super.
238. Technical Schools	8d.	—	—
239. Town Halls	1s. 1d.	—	—
240. Theatres	1s. 3d.	—	—
241. Tramways, Cable. Double track, as for streets in England, with paving of granite, setts, &c., complete, including equipment, 3ft. gauge	—	—	£18,000 per mile

242. Analytical Table of Average Cost per Mile of Double-Track Cable Tramway Complete.

Description.	Rails, sleepers, chains, bolts, &c.	Wire cable, supporting pulleys, and ironwork for central tube.	Laying cables and permanent way.	Excavating and making good to roads, including granite setts, concrete foundations, &c.	Depot, including engines, boilers, &c.	Equipment.	Total.
3ft. gauge	£2,000	£3,000	£500	£6,800	£1,700	£4,000	£18,000

	Average Cost.		
	Per foot cube.	Persquare of 100ft. super.	Per unit.
243. Tramways, Electric Traction. Double track, as for streets in England (overhead system), with paving of granite setts, &c., complete, including equipment, 3ft. gauge	—	—	£11,000 per mile
244. Tramways, Horse Traction. Double track, as for streets in England, with paving of granite setts, &c., complete, including equipment, 3ft. gauge	—	—	£10,000 per mile
245. Tramways, Steam Traction. Ditto, ditto, ditto, 3ft. gauge	—	—	£12,000 per mile
246. Tramways, Electric Traction. Single track, as for country districts in Ireland, complete including equipment, 3ft. gauge	—	—	£5,000 per mile
247. Tramways, Horse Traction. Ditto, ditto, ditto, 3ft. gauge	—	—	£2,000 per mile
248. Tramways, Steam Traction. Ditto, ditto, ditto, 3ft. gauge	—	—	£3,000 per mile
249. Tramways. Wire rope, for precipitous or hilly situations, having a running wire rope driven by a stationary engine. Including engine, timber supports (about 28 to the mile), carriers, &c., complete. To carry about 10 tons per hour..................................	—	—	£1,300 per mile
250. Tramways. Ditto, ditto, having two fixed wire cables for supporting the load carriers, the carriers being attached to a running wire rope driven by a stationary engine. Including engine, framed timber supports, concrete foundations, carriers, &c., complete, to carry a load of 10cwt. per carrier	—	—	£3,000 per mile
251. Tree-Guards. As for public parks, thoroughfares, &c., wrought iron, unclimable, 2ft. diameter, 5ft. high	—	—	16s. each
252. Tree-Guards. Ditto, ditto, 3ft. diameter, 5ft. high	—	—	£1 each
253. Tunnels, Railway. In limestone or clay and lined ..	—	—	16s. per yard cube
254. Unions. (See "Workhouses")	—	—	—
255. Urinals as for public institutions, &c., complete, with enamelled slate back, divisions, earthenware basin and waste, copper supply pipe, stoneware gutter, &c., but exclusive of water supply, walls, roof, &c.	—	—	£8 10s. per person
256. Urinals, Street. Complete, with ornamental iron screens, divisions, roof, &c., but exclusive of water supply, for three persons ..	—	—	£60 each
257. Urinals. Add for each additional person	—	—	£10 each
258. Ventilation, complete for dwellings, with fresh air inlet, foul air outlet, and including flue in chimney-stack	—	—	£2 per room
259. Ventilation for stables, complete	—	—	£1 per horse
260. Verandahs, Ornamental. Complete, with slate or stone floor, iron columns, railing, roof, eaves gutters, &c., width 3ft. 6in.	—	—	£3 per foot run
261. Verandahs, Plain. As for infirmaries, workhouses, &c., complete, with slate or iron perforated floor, iron columns, railing, roof, gutterings, &c., width 3ft. 6in.	—	—	£1 10s. per foot run
262. Walls, Brick Inclosure. As for yards, &c., 7ft. high, brick coping, concrete foundations, digging, &c., 9in. thick	—	—	7s. 6d. per foot run
263. Walls. Ditto ditto ditto 14in. thick	—	—	10s. per foot run
264. Walls. Ditto ditto 10ft. high, and ditto 9in. thick ...	—	—	9s. 6d. per foot run
265. Walls. Ditto ditto ditto 14in. thick	—	—	13s. 6d. per foot run
266. Walls, Brick, External. In lime mortar, including digging and filling. Concrete footings, damp-course, brick plinth, stringcourse, and cornice; external facings, finished fair and lime-whited inside; doors, sashes and frames, and usual finishings. Walls built solid, 9in. thick	—	£6 10 0	—
267. Walls. Ditto, ditto, ditto. 14in. thick	—	£8 2 0	—
268. Walls. Ditto, ditto, ditto. 18in. thick	—	£9 12 0	—
269. Walls. Ditto as before, but walls built *hollow* with 2¼in. cavity, including bonding bricks. 11¼in. thick ...	—	£7 18 0	—
270. Walls. Ditto, ditto, ditto. 16in. thick	—	£9 8 0	—
271. Walls, Brick, External. In lime mortar, including digging and filling. Concrete footings, damp-course, brick plinth, string-course, and cornice; external facings; plastered and papered inside; doors, sashes and frames, and usual finishings. Walls built solid, 9in. thick	—	£7 12 0	—
272. Walls. Ditto, ditto, ditto. 14in. thick	—	£9 4 0	—
273. Walls. Ditto, ditto, ditto. 18in. thick	—	£10 16 0	—
274. Walls. Ditto as before, but walls built *hollow*, with 2¼in. cavity, including bonding bricks. 11¼in. thick ...	—	£9 2 0	—
275. Walls. Ditto, ditto, ditto. 16in. thick	—	£10 14 0	—
276. Walls, Brick, Internal, in lime mortar, including digging, concrete footings, finished fair, and lime-whited both sides; internal doors and usual finishings. 4½in. thick	—	£3 18 0	—
277. Walls. Ditto, ditto, ditto. 9in. thick	—	£5 8 0	—
278. Walls. Ditto, ditto, ditto. 14in. thick	—	£6 18 0	—
279. Walls. Ditto, ditto, but plastered and papered both sides. 4½in. thick	—	£5 2 0	—
280. Walls. Ditto, ditto, ditto. 9in. thick	—	£6 16 0	—
281. Walls. Ditto, ditto, ditto, 14in. thick	—	£8 8 0	—
282. Walls, Brick, Extra only to. For each chimney-flue, including digging, concrete footings, lead flashings, chimney-pot, &c., but exclusive of chimneypiece, grate, or kitchener	—	—	£6 each
283. Walls, Brick, Extra only to. For each bay-window, including digging, concrete footings, roof, lead flashings, sashes, frames, and finishings of ordinary description	—	—	£10 each
284. Walls, Stone, External. In lime mortar, including digging, concrete footings, damp-course, coursed rubble hammer-dressed walling with half-brick internal lining, wrought stone plinth, string-course and quoins, finished fair and lime-whited inside. 20in. thick..	—	£11 0 0	—
285. Walls. Ditto, ditto, ditto. 24in. thick	—	£12 5 0	—
286. Walls. Ditto, ditto, ditto, but plastered and papered inside instead of lime-whited. 20in. thick	—	£12 5 0	—
287. Walls. Ditto, ditto, ditto. 24in. thick.........	—	£13 10 0	—

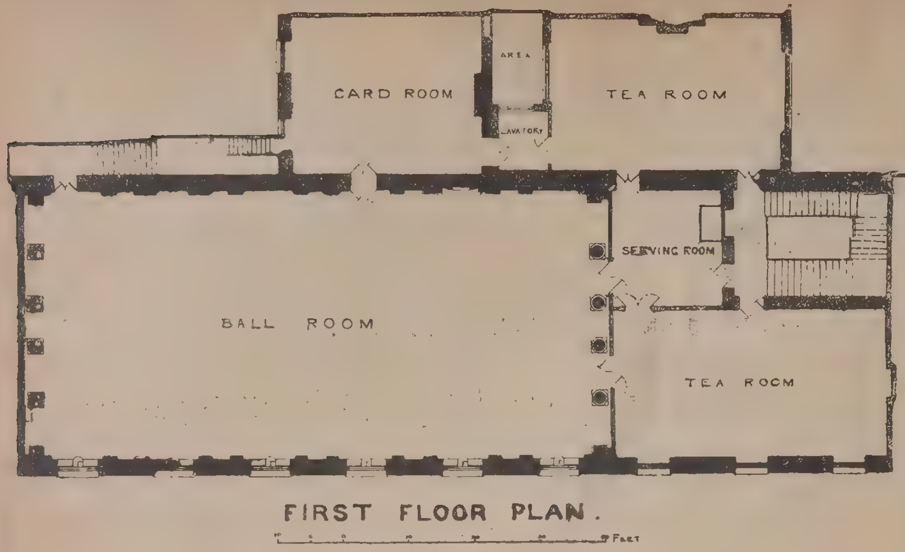

Fig. 1.

CONCERT HALLS AND ASSEMBLY ROOMS.—VII.

By Ernest A. E. Woodrow, A.R.I.B.A.

It will be seen from the drawings of Willis's Rooms (Figs. 1, 2, and 3) that a magnificent dancing saloon existed on the first floor, 40ft. wide by 85ft. long and 29ft. in height from floor to ceiling. This room—which I have chosen as an illustration because it was one of the most noted assembly rooms of fashionable London for very many years—was approached from King-street by a staircase 6ft. wide. At one side of the room was a card-room, 28ft. by 24ft., and a tea-room or second card-room, 35ft. by 24ft. This room could also be used as a retiring-room or a drawing-room for those who wished to rest during the dances. The large tea-room at the end of the hall measured 42ft. by 23ft. This was the reception-room; people arriving passed from the landing at the top of the staircase through this room into the ball-room, and were here received by the host and hostess when private dances were given. It was in this room that for a long time the meetings took place of the Dilettante Society. Between the two reception-rooms was a serving lobby, with a lift to the kitchens below, and it was from this serving-room that the light refreshments were passed into the tea-rooms.

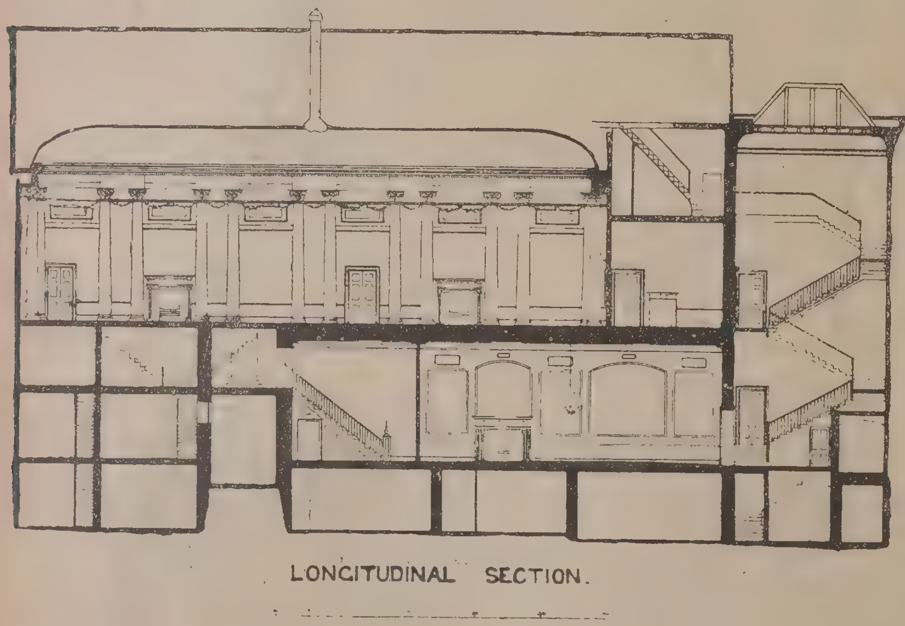

Fig. 2.

On the ground floor below, as seen on the section, was a large supper-room, entered from the vestibule of the grand staircase.

The basement was occupied by extensive kitchens and wine-cellars, fully adapted to meet the requirements of the business carried on in this building, for not only did dances take place here, but dinners, banquets, and meetings were frequently held within the walls.

The ventilation of the dancing-room was obtained by the windows overlooking King-street. The room was lit by means of large gaseliers hung with lustres, which were afterwards altered for the fittings of the electric light.

The dancing-floor was nearly 2ft. in thickness, carried on wrought iron girders, and when the floor was fully loaded with dancers the spring in the floor was such that the deflection in the centre was as much as 4in. The floor is said to have been an excellent one for dancing, and much in favour with the dancers on account of its smoothness and elasticity.

Another form of dancing-room existing in London is that which is attached to the dancing school, which is used in the daytime for tuition, and at night for public dances, as well as dances among the pupils, and for private parties. It is perhaps this class of dancing-room which, from the point of public safety, is the worst kind of existing room used for dancing in London. There are very few of these rooms which are licensed by the authorities, as the owners protect themselves by pleading that the dances given at their establishments are not public dances, but only for the tuition and practice of their pupils; yet, from the architect's point of view this should make no difference; the danger, if it exists, being as great for the pupils as for the general public.

It is a sure proof that these rooms, as a rule, are not structurally fit for the assemblage of large numbers of people, when one finds how very few have been licensed by the authorities, and how many the authorities have taken proceedings against for being opened to the public without a certificate of safety. In some cases the owners of the premises have been fined for using their rooms for the public; in other cases they have been let off.

Now there is no difficulty in obtaining the certificate of the London County Council for a building, when that building is deemed safe by the Council's architect, and yet we find, although an attack was made upon these dancing-rooms, and although the magistrates advised the owners to apply for this certificate, but very few hold such a certificate, and why? Because they are not structurally in such a condition as to justify the Council granting it.

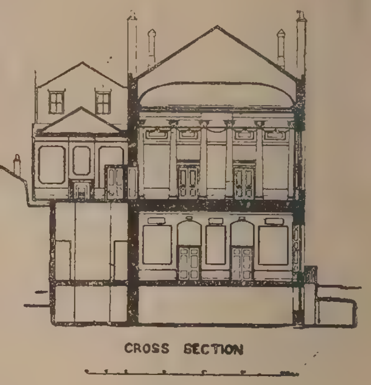

Fig. 3.

All this points to the fact that, whether used by public or private individuals, the dancing-rooms of this class in London still lack much that is desirable in their arrangements for the prevention of fire and panic. Many dancing-rooms are connected in the same fire risk as the private residence of the instructor; some are built out, in the form of a temporary structure, over the garden ground in the rear of a house, with no other escape except through the house; others are connected with premises in different occupation, such as shops; while others are equally unfit for any assemblage of people by being situated at a level above the street, and approached by only one narrow wooden staircase.

In connection with most of these dancing-rooms are supper-rooms where smoking is allowed; smoking also takes place in the passages—all adding to the danger from fire. The construction is generally very bad, and consists of alterations and additions to old premises carried out in the cheapest manner, with no regard to prevention of fire, or the escape of the occupants of the room.

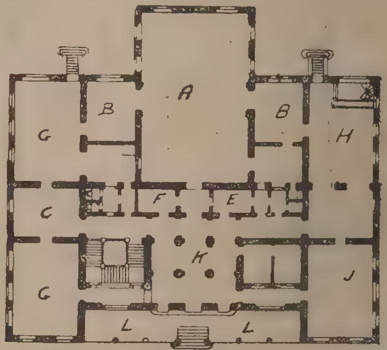

Fig. 4.—A, hall; B B, drawing-room; E, ladies' cloak-room; F, gentlemen's cloak-room; G, supper-room; H, buffet; J, billiard-room; K, vestibule; L, terrace.

I can only repeat here what I said with regard to parish rooms: it cannot matter to the architect how a room is used, whether by public or private parties: the lives are equally valuable, and the risk of fire and panic equally great. The same argument applies whether the premises are licensed or not. It is clearly the duty of the architect designing a dancing academy to look upon it as an assembly hall, and to consider all the requirements in his planning for the quick escape of the dancers by good exits, as well as to

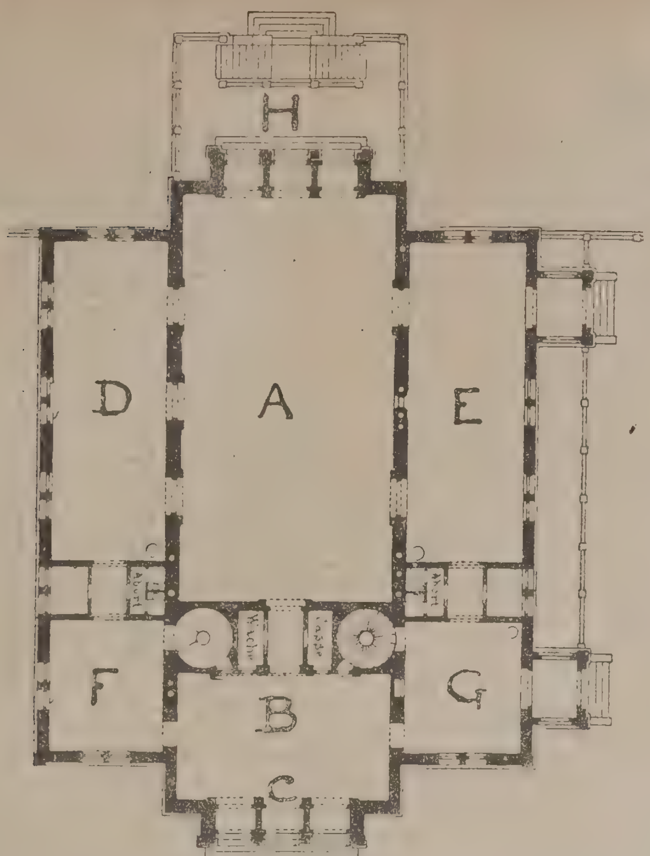

Fig. 6.—A, hall or dancing-room; B, vestibule; C, entrances; D, refreshment-room; E, drawing-room; F, cloak-room; G, buffet; H, terrace.

construct his building and arrange his plan so as to minimise the risk from fire therein, or from any adjacent building, or even from the adjuncts of the building itself.

The sanitary accommodation of the dancing-room of this class is too frequently sadly deficient; large cloak-rooms are much needed, and, as I have already said, supper-rooms and smoking-rooms are required, but these should be planned with due regard to safety. There should never be open fireplaces in a dancing-room, as the danger of a light ball-dress catching fire from such a source is very great. High iron wire guards should be placed in front of all fireplaces, where they exist; but it is better under any circumstances to heat the room by other methods than by an open fireplace.

The construction of the dancing-floor will undoubtedly cause the proprietor more interest than the arrangements of safety. This is, of course, an essential feature in the design; a small minstrel gallery is also a requisite in the dancing-room. The proprietor or instructor will need an office for the transaction of his business near the entrance.

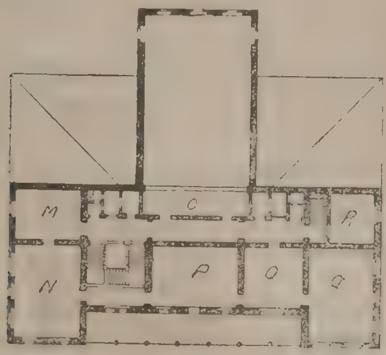

Fig. 5.—M, library; N, reading-room; O, orchestra; P, drawing-room; Q Q, supper-rooms; R, committee-rooms.

There are some large dancing-rooms devoted entirely to the teaching of stage dancing, and they are of such a size that the whole *corps de ballet* can be instructed and trained for the stage. These rooms are used where no stage floor in a theatre is available, and where the performances are rehearsed for the provinces. Even these buildings should have equal structural care devoted to them, although they are never used by the public.

Strictly speaking, there are very few, if any, casinos in London which can be looked upon in the same light as the word "casino" conveys when referring to the buildings of the Continent which go under this name. By a casino is meant, I presume, in London a place of public dancing, where the public can enter promiscuously to dance without invitation or introduction—a place kept open constantly for public dancing. Of such places there are few in the Metropolis. The public dances which are given are generally under the auspices of some individual or society, and are held in a public assembly room hired for the night or for a series of evenings during the season.

The casinos of the Continent are very different buildings, and used in a very different way. They are more like clubhouses, replete with every comfort and for every form of amusement. Rooms are provided not only for dancing, but there are billiard-rooms, card-rooms, libraries, reading-rooms, supper-rooms, conversation-rooms, &c.

I propose in this and the next chapter drawing attention to one or two plans showing the development of these buildings as a contrast to the dancing-rooms which the general run of the public have to put up with in London. It must not be thought that I mean there are no good rooms in London where dances can be held; on the contrary, there are. But what I particularly refer to is the lack of rooms devoted primarily and exclusively to dancing only.

In Figs. 4 and 5 are seen the plans of the Marine Casino at Pola, which is a building standing in a splendid position in the middle of a great park. Wide steps lead to a terrace, into which the vestibule opens by three doors. To the right is the porter's room; to the left, the grand staircase. From the vestibule an ante-room is reached through an arched staircase; on either side are the ladies' and gentlemen's cloak-rooms, while there is a separate entrance from the hall leading directly into the ladies' retiring-room. The hall is 60ft. long by 37ft. wide, and has dining-rooms on either side. One side of the building is occupied by a series of supper-rooms, used also as drawing-rooms for resting between the dances, while on the other are placed the buffet and billiard-room. Both the wings are connected with the garden. The orchestra is placed in a musicians' gallery at one end of the hall on the first-floor level. On this floor are situated library, reading-rooms, drawing-room, and small supper-rooms.

In Fig. 6 is a plan of the Casino at Brünn, which holds 1,000 persons. This is also situated in a large park, and has four entrances, one at each end and two on one of the sides of the building. The difference in the height of the ground allowed for the formation of a terrace with steps leading to the garden. The large or dancing-room is 69ft. long, by 36ft. wide, and 36ft. high. The orchestra is placed in a gallery at one end.

CHIPS.

A lecture on "Lights, Ancient and Modern," was delivered on Thursday night in last week by Mr. Ivison Macadam, F.R.S.E., in the Philosophical Institution, Edinburgh, under the auspices of the local branch of the National Society for the Registration of Plumbers. Mr. John Allan presided.

According to the statistics of the Labour Department, there is a distinct improvement in employment in principal industries, the percentage of unemployed being lower than for any month since November, 1894. A further slight seasonal decline in employment is observable in the building trades, which, however, continue to be well employed. The percentage of unemployed in November in unions making returns is 1·1, compared with 1·9 in October, the November figure being considerably below the percentage (4·2) in November, 1894. A slight failing-off in employment has taken place in the furnishing and woodworking trades. The percentage of unemployed in November in unions making returns is 2·9, compared with 2·6 in October, and with 2·5 in November, 1894.

The city council of Sheffield, after a long discussion, decided at their last meeting to promote a Water Supply Bill in Parliament next session to protect the Little Don waters, and also a Bill to take over the existing tramways in the main streets of the city.

The Northern Lighthouse Commissioners have resolved to proceed without delay with the erection of a new lighthouse at the Tud Head, on the farm of Hallhill, near Bervie, Kincardineshire. Several contractors have visited the site during the past few days with the view of giving in estimates for the work. The proposed lighthouse will be midway between the existing ones at Girdleness and Montroseness.

It is a noteworthy illustration of the ever-increasing demand for typewriters that the Yost Typewriter Company have felt it necessary to manufacture writing machines fitted with Hindustani characters. Her Gracious Majesty has been pleased to inspect and commend this unique machine, which, in the opinion of its manufacturers, will give an impetus to the typewriter business in the "far East."

An entirely new system of drainage and sewage disposal has recently been carried out at Road Ashton, Wilts, the seat of the Right Honourable W. H. Long, M.P., from plans prepared by, and under the superintendence of, Mr. W. H. Stanley, A.M.Inst.C.E., of Trowbridge. The works, costing over £1,400, have been executed by Mr. John Smith, of Chippenham, builder, and Messrs. Gowan and Stevens, of Trowbridge, plumbers, Mr. H. Hillier, of Marlborough, being resident engineer.

The Southend Town Council have decided to extend the pier seawards, at a cost of over £20,000. It is hoped the work will be completed for next season.

The contract for the remaining portion of the Buxton and Ashbourne Railway, from Parsley Hey to Ashbourne, has this week been let to Messrs. Naylor Brothers, Leeds, who constructed the Buxton and Parsley Hey section of the line, and are at present engaged upon the Buxton District Council's new reservoir at Burbage.

The Lands Committee of the City Corporation has commissioned Mr. F. J. Williamson, of Esher, to execute a bust in marble of the Duke of Cambridge, to be placed in the Guildhall.

The Wath and North Rotherham Joint Hospital Board have decided to invite competitive plans for a building of twenty beds, limited to architects practising within a radius of fourteen miles of the district.

Plans by Mr. Bennett, of Coventry, for a Shakespeare theatre to be built at Clapham have been passed by the London County Council.

Mr. George Clinch, of the British Museum library, has been appointed clerk and librarian to the Society of Antiquaries, in succession to Mr. E. C. Ireland.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

CHRISTMAS DAY.

Next week the Building News will be published on the usual day; but, in order to complete arrangements before the holidays, it will go to press on TUESDAY, and all advertisements for the next issue must reach the Office

BEFORE FIVE P.M. ON TUESDAY, DEC. 24.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received. — E. L. Maclaren. — J. W. P.—Civ. Eng.—E. W. and Co.—Traveller.—W. B. (Salford).—F. R. and E. R. Co.—C. W. L.

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received.—"Ilex," "Cygnette," "Venus," "Owl," "Moor," "Dunelm" (no name and address), "T-Square," "Kaffir," "Puff-Puff," "Black-beetle," "Mandalay," "Once More," "Country Cousin," "Dessinateur," "E.," "Red Lion."

Correspondence.

SHOREDITCH BATHS AND LIBRARY COMPETITION.

To the Editor of the Building News.

Sir,—I am informed, on good authority, that the award of the referee, Mr. Rowland Plumbe, was only confirmed ultimately by a majority of *one*, so that Mr. Hare may be said to have really secured the work by merely a hair's-breadth. Things in the mean time are not going very smoothly, I hear, as the Library Commissioners feel that they have been sacrificed to the requirements of the Baths Commissioners, and in any case, even if the Vestry grants the necessary precept, very material alterations in the plans for both departments will be necessary.—I am, &c.,

One in the Crowd.

JERRY-WORKED STONE.

Sir,—Occasionally I read in your journal of the doings of jerry builders. I now wish to call the attention of architects and builders who get their stone worked ready for fixing at the quarry to the way in which some jerry stone-working is done by machinery in some of the quarries in the south-west of England. In some cases the machine cuts the weatherings of the sills the whole length of the stone, and masons have then to put in the seats of jambs, &c. Under-cut mouldings in return pieces of cornices and string-courses are cut through in the same way, and pieces put in, and in some cases the pieces are not dovetailed. If this is not jerry stone-working, I do not know what other name to call it. What would a gentleman say if, passing by a well-known London theatre, a piece of stone several pounds in weight dropped on his new hat. or where could he get redress for a broken head? I write this hoping architects, &c., will see that none of their stonework is scamped in this way in the future.—I am, &c.,

A Mason who has Put in Some of these Pieces.

P.S.—It is not because the stone is sold at a cheaper rate by working it thus, for I see the firm wanted £1,000 more for their stone than the builder could get the best of the Bath stone for a job near Taunton only a few weeks ago.

Intercommunication.

QUESTIONS.

[11466.]—**Lecterns**.—In a pleasantly-written brochure by Mr. Walter Money, F.S.A., of Newbury, entitled "An Old Berkshire Village," a very old lectern is referred to. It exists in the Church of St. Augustine of Canterbury at East Hendred, and is thus mentioned by the accomplished author: "The oak lectern is a remarkable one, being of 13th-century date, and in good preservation." I have always assumed that the one at Bury and the 14th-century carved oak eagle lectern now in use at St. Thomas's Church, Exeter, and formerly in Exeter Cathedral, were two of the oldest oak lecterns in England. Surely the lectern at East Hendred is not Early English workmanship?—Harry Hems.

[11467.]—**Fumigated Oak.** — Will some reader kindly describe the method of fumigating oak?—Old Crow.

[11468.]—**Account.**—A. and B. are partners in a small building business, and have been in business nine months. The plant belongs to A. What would be a fair percentage for A. to charge for use of plant? Please also state if percentage should be charged on total amounts of bills rendered to customers, or on profits.—Gale and Page.

[11469.]—**Advertising.**—Would it be considered a breach of etiquette and unprofessional for an A.R.I.B A. to insert a notice of practice in a local paper? If so, how is a man to build up a practice?—Enterprise.

CHIPS.

The site at Llandudno granted by Lord Mostyn for the pavilion in which the Eistedfodd of 1896 will be held has been entered upon by the committee, the land, which is in the immediate vicinity of the railway station, being plotted out by Mr. Humphreys, the local agent of the Mostyn estate. Messrs. Darbyshire and Smith, Manchester, are the architects.

A new savings bank is about to be built at Gateshead. Mr. Stephen Piper, Westgate-road, Newcastle-on-Tyne, is the architect.

The Stowmarket Charity Trustees are building premises at Stowmarket from the designs of Mr. Henry Geo. Bishop, M.S.A. Messrs. Andrews and Murray are the contractors. The floors are to be fireproof, on the "Mark Fawcett" system. The constructional iron and steel work is being supplied and fixed by Messrs. Mark Fawcett and Co., of Westminster.

New Board schools have been erected at Peterborough, and special consideration has been given to ventilation, which has been carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of vitiated air, and their latest improved air inlets for the admission of fresh air.

Dr. Vaughan, Dean of Llandaff and late Master of the Temple, was presented with a portrait of himself on the 12th inst. at the studio of Mr. Ouless, R.A., by whom the portrait has been painted. The picture, which represents the dean in gown and hood, has been subscribed for by the clergy who have, during the last 35 years, successively studied under Dr. Vaughan in preparation for holy orders.

The trustees of the National Portrait Gallery have accepted from Mr. W. M. Rossetti a pencil drawing, head and shoulders, of the Pre-Raphaelite painter, Ford Madox Brown, done by Dante G. Rossetti in 1852.

In recognition of faithful services rendered by Mr. John R. Brown, for 25 years assistant-master at the Liverpool School of Art, the past and present students have presented him with a purse of gold and an illuminated address.

The Great Eastern Railway Company proposes to construct a short railway from their station at North Walsham on the Norwich and Cromer line to form a junction with the authorised Mundesley branch of the Midland and Great Northern Railway Companies. This junction will enable it to run to Mundesley, a rising watering-place on the Norfolk coast, midway between Yarmouth and Cromer.

The result of last week's sales at the Estate Auction Mart, Tokenhouse-yard, was £86,511, a very good figure for the time of the year.

Legal.

RAILWAY SUPERFLUOUS LANDS.

When a railway company has to take land for the purpose of its undertaking, it frequently happens that it has to take more than is actually required. These superfluous lands are dealt with by the Lands Clauses Act, 1845, under which it is provided that the promoters of every such undertaking shall sell those lands they do not require within a specified period; but before doing so they must offer them to the owner of the lands from which they were originally severed. This right of pre-emption in the former owner may sometimes be of value, and it has occasionally given rise to litigation. The latest case upon this subject is that of the North-Eastern Railway Company (*Times*, 7th Dec.). In this case the railway company had, under their special Act, purchased from the plaintiff's predecessors in title, as long ago as 1863, about 57 acres of land in the neighbourhood of Goole in Yorkshire. They did not use all this land in their own undertaking; but in 1883 the Lancashire and Yorkshire Railway, by their special Act, were authorised to take by compulsion or agreement a portion of this land for their new line, and they did so accordingly. The plaintiff now claimed that this land came within the scope of the statute as superfluous land, and should have been first offered to him, and he sued for damages for breach of his right of pre-emption.

Mr. Justice Kekewich was of opinion that the fact of the North-Eastern Railway having sold this land to the other railway proved it to be superfluous land, and gave judgment for the plaintiff. But on appeal this ruling has been altogether reversed. The Court of Appeal held that the sale of this land to the Lancashire and Yorkshire Railway under the compulsory powers of the special Act of that company was no proof whatever that the land was superfluous within the meaning of the statute. It was shown also that if the new railway had not wanted and obtained the lands the defendants would themselves have used them. Still, the case may be of service in calling attention to the right of pre-emption possessed by the former owner of superfluous land, of which there is no doubt a great deal lying more or less idle nowadays.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

T. R.—Road.—Wall.—Repair.—Probably A can be compelled to repair the whole length of the road in front of his houses; but he should request the local board to serve notice on the ground landlord as an adjoining owner. As to the wall, A does not appear to me to be liable, and the owner should be made to repair it.

Formality.—Drains.—Notice.—The sanitary authority ought to give a certificate showing that the work ordered had been done to their satisfaction and passed by their surveyor.

D. F.—Lease.—Drains.—Liability.—This point would turn not only upon the covenant to repair, but also upon the other covenant by the lessee as to paying all "assessments, charges, outgoings," &c., imposed upon the house. The making of new drains does not come within an ordinary repairing clause; and as to the rest, I am not informed.

W. S. D. — Local Board. — Wall. — Thickness. — I think the board may be held right, as your walls do "comprise"—that is to say, carry-three stories, one being in the roof; and if so, then they should be 13½in. throughout, as they end "below the topmost story." If the walls went higher, then 9in. would be enough for that portion, which you do without altogether.

C. W. S.—Lease.—Fabric.—Floor.—I should say the lessee was not liable under his covenant, as this would come in under the exception as to "timbers" by analogy.

LEGAL INTELLIGENCE.

Restrictions on Alterations to Flats.—Hudson v. Cripps.—In the Chancery Division on Friday, before Mr. Justice North, a motion was made on the part of Mrs. Hudson, a tenant of a flat on the second floor of Oxford-mansions, to restrain the landlord, the defendant in the action, till trial, from going on with certain alterations in his premises, which have been commenced, with a view of providing accommodation for a new Cavendish Club. Oxford-mansions stands on the site of Oxford Market, near Oxford-circus, and was erected some 20 years ago for the purpose of being let in flats. It is a quadrangular building, with a court in the middle, having one common entrance and staircase for all the tenants, the premises on each floor having access by verandahs with the general staircase. Mrs. Hudson held her flat (a suite of five rooms) under a printed agreement which contained various stipulations and conditions, in effect limiting the use of the premises to the purposes of a residential flat, and made for the mutual protection of the tenants of all the flats. Till recently the whole of the premises had been used as residential flats, with the exception of certain rooms on the ground floor looking on the street, which had been used as offices. The defendant's own evidence showed that he was turning the whole of the two lower floors into a club, and that he was inclosing the courtyard in the middle up to the top of the first floor with a glass roof. The plaintiff's evidence, filed recently, went to show that it was intended to turn the rooms on the higher floors into bedrooms for the club, and that the kitchen ranges on those floors had been removed. Mr. Justice North was of opinion that, looking at the fact that the agreement was in printed form, that the premises were occupied when the agreement was made, and had been for many years occupied, as residential flats, and at the various provisions contained in the agreement and incorporated regulations, it was clear that the provisions contained in it were intended to be applied to all the flats for the mutual protection of all the tenants. It seemed a case that came within the principles laid down by Lord Macnaghten in the case of "Spicer v. Martin," and acquiesced in by the other Lords, and always since accepted as law—a case in which a lessor was restrained from letting houses in a block of buildings for purposes inconsistent with restrictions imposed on the lessees generally. He therefore granted an injunction.

The Aquisition of London Tramways.—The question of the right of the London County Council to acquire the tramways in North London came, on Friday, before the Court of Appeal by way of appeal from a decision of Mr. Justice Romer in favour of the Council. The North Metropolitan Tramways Company claimed that the Council could not exercise their statutory powers until the expiration of twenty-one years from the passing of the company's last Act of Parliament in 1887; but the County Council maintained that it should date from 1871. The Master of the Rolls said the appeal must be dismissed, on the ground that a private Act could not overrule an existing public Act, unless the private Act by express words overruled it. Lord Herschell and Lord Justice Kay concurred.

Manchester Canal Contract Arbitration.—The arbitrator, Mr. Harrison Hayter, has published his award in the matter of the claim of Sir John Jackson against the Manchester Ship Canal Company. The claimant was the contractor for sections 1 and 2 of the canal, and also for some minor works, and the present claim was for extras only. The arbitrator sat in the Westminster Palace Hotel for 14 days, and the number of witnesses on either side was limited to four. A novel feature in arbitration of this magnitude was that the conduct of the case was placed by the respective parties in the hands of their solicitors, no counsel being retained. The amount claimed by Sir John Jackson was £107,601, and the amount awarded by the arbitrator is £36,650, including a sum of £10,370 for interest up to September 30, 1895.

Charge against an Architect and his Assistant.—Before Sir John Bridge, at Bow-street, on Thursday and Saturday, Kent Pinchbeck, described as an architect, York-buildings, Adelphi, and Alexander Martin, architect's assistant, of the same address, were charged on remand with conspiring to defraud by means of false pretences. The prosecutor was Mr. George Wilkinson, of the firm of Wilkinson and Sons, builders, Clarendon-road, Notting-hill. In consequence of an advertisement, he saw Pinchbeck on March 13 of this year, and was requested to give a price for erecting a pair of villas at Northwood, Middlesex. He said the houses were wanted by a rich client of his, Mr. Miles Atkinson, of Blackheath, and was corroborated by Martin, who appeared to be the manager of Pinchbeck's business. Believing these statements to be true, Mr. Wilkinson entered into a contract with "Miles Atkinson, Esq., of Blackheath," and erected the villas. He never saw Mr. Atkinson, but received two payments on account from Pinchbeck—a cheque for £200 in June, and one for £50 in September. He roofed in the houses and connected them with the drains, and there was about £445 due to him. He pressed for payment, but could get no more money, and ultimately refused to proceed with the contract. Prosecutor made inquiries at the police-station and post-office at Blackheath, but could find no Miles Atkinson there. A short time ago the case of "Rollett v. Pinchbeck" came on in the High Court before Mr. Justice Mathew. The plaintiff was a builder, and sued Pinchbeck for money. Pinchbeck said he was only an architect, and that, if anyone was to be sued, it should be Miles Atkinson, his principal. Martin gave similar evidence. Prisoners had obtained money from three other builders on identically the same representations, the total sum amounting to £1,500. The land on which the houses were built was purchased in 1894 by Pinchbeck, and they had been unable to trace any Miles Atkinson. Pinchbeck mortgaged the deeds, and gave out contracts in the name of Atkinson. He granted building leases to Marian Pinchbeck, his wife. He sold the ground rents for £1,530, and his wife mortgaged the leasehold interest for sums amounting to upwards of £2,000. Mr. Miles Atkinson was now called by the solicitor for the defence. He said that he signed the building contracts referred to, and at that time was in a position to fulfil their conditions. The prisoners were again remanded, without bail.—In connection with this charge, Mr. J. B. Pinckbeck, architect and surveyor, of 92, Hampstead-road, N.W., has written to the daily Press explaining that he is in no way connected with Kent Pinchbeck.

Conversion of Exempted Buildings.—At Lambeth Police-court, on Tuesday, William Robert Green, the owner of the premises, No. 98, Hollydale-road, Peckham, was summoned by Mr. Ellis Marsland, M.S.A., district surveyor for Camberwell, "for converting a building—to wit, a greenhouse, which, when originally erected, was legally exempt from the operation of the Building Act, into a workshop and store." Mr. Williams said the summons was taken out for a contravention of the 211th section of the new Building Act. The offence complained of was one which was very much on the increase. Mr. Marsland said on December 7 he visited the premises, No. 98, Hollydale-road, and found a greenhouse used for the storage of paint, turpentine, wall-papers, and other combustible materials. A portion of the roof was covered with corrugated iron, and two of the sides were boarded up. By his Worship: The building was originally a greenhouse. Under the new Act a builder could put up a greenhouse without notice to the district surveyor. Builders were finding that out, and were putting up greenhouses, and then converting them for use for other purposes. For the defence, Charles Malthouse, the tenant of the premises, said he entered into occupation in September last, and the greenhouse was erected by the defendant for his (Malthouse's) convenience. It was now in exactly the same condition as when it was originally constructed. Witness had been repairing the house, and during the progress of the work he put some paint-pots and other articles in the greenhouse out of the way. He intended to use the building as a greenhouse when a stove had been fixed. Mr. Hopkins adjourned the summons *sine die.*—Mr. Samuel Morrison, of The Gables, Alleyn Park, was summoned for converting a greenhouse into a billiard-room. In this case the offence was admitted, and Mr. Hopkins fined the defendant 20s., with 42s. costs.

WATER SUPPLY AND SANITARY MATTERS.

The Prevention of Lead-Poisoning.—At Monday's meeting of the Association of Yorkshire Students, connected with the Institution of Civil Engineers, Mr. O. J. Kirby, Batley Waterworks Engineer, read a paper on "Waste of Water due to Lead Contamination and the means of Preventing such Contamination." He mentioned that a newspaper correspondence on the subject of lead-poisoning had led to an increase in the consumption of water at Batley of over 100 per cent., the people allowing taps to run before drawing water. The author dealt with the various means of preventing the presence of peat in the water, which was said to be the chief cause of the action upon lead, and described his method (with that object in view) of preventing the first rush of storm-water into the reservoir by means of self-closing flood-gates. Mr. Thomas Hewson, M.Inst.C.E., vice-president, who was in the chair, said that the Leeds water, though containing a certain quantity of peat, was reported to have no action upon lead, and hence no special measures were considered necessary. Mr. M. Patterson, M.Inst.C.E., referred to the objections to the use of other materials than lead for service pipes, and said that English-made lead, containing a small proportion of silver, was far less readily acted upon than foreign lead. He also mentioned cases where, owing to the arrangements of the reservoirs, the author's method was inapplicable. In the case of Loch Katrine water, six months' exposure was found to stop all deleterious action upon lead. Messrs. C. C. Smith, A. E. Nicholls, George Carter, and F. L. Watson also took part in the discussion, to which Mr. Kirby replied.

* * *

At their meeting on Thursday morning last (Dec. 12th) the Fulham Board of Guardians confirmed their building committee's recommendation to appoint Mr. Walter Herring, of Trafalgar-buildings, Northumberland-avenue, W.C., to prepare the quantities for the additions to the workhouse in Fulham Palace-road, the designs for which are being prepared by Mr. Alfred Saxon Snell, architect, Southampton-buildings, Chancery-lane, E.C.

Our Office Table.

The authenticity or otherwise of a hitherto unknown portrait of Shakespeare formed the subject of an interesting discussion at the meeting of the Society of Antiquaries on Friday evening, inaugurated by Mr. Lionel Cust, the director of the National Portrait Gallery. The picture, which was exhibited at the meeting, is one recently discovered by Mr. Edgar Flower, of Stratford-on-Avon, and presented by him to the Shakespeare Memorial Institute of that town. In illustration of Mr. Cust's paper, a number of other portraits, a cast of the celebrated Stratford bust of Shakespeare, &c., were exhibited, and he announced that in his opinion (and he is supported by Mr. Sidney Colvin) the new portrait is the only one known to be in existence that was painted during the lifetime of the dramatist. A close comparison between it and the well-known engraved portrait by Martin Droeshout, the frontispiece to the first folio edition, 1623, and the bust in Stratford Church, which have hitherto been the only two avowed likenesses of Shakespeare known, suggests to Mr. Cust that the portrait now shown is the original from which the engraving was taken. The picture bears an inscription, "William Shakespeare, 1609," which would indicate that it was painted in the closing year of the poet's life. As a work of art it possesses no merit, but the interest of the portrait is considerable. Sir Charles Robinson was not able to go so far as Mr. Cust in assigning the picture to Shakespeare's lifetime, but he had no doubt that it was a genuine portrait of the early part of the 17th century, and certainly the earliest, if not the only authentic, portrait in oils of the poet in existence. That the picture has no pedigree was, in the opinion of several speakers, in its favour.

At Carpenters' Hall, London-wall, on Wednesday night, the Rev. Dr. Wace, the Principal of King's College, presided at a distribution of prizes and certificates to students attending the Trades Training School, Great Titchfield-street, W., a technical education centre conducted by the Carpenters', Tylers' and Bricklayers', Wheelwrights', Painter-Stainers', Plasterers', and Joiners' Companies, in conjunction with the Institute of British Wood Carvers. The prizes were presented by Mrs. Bird, the wife of Colonel Stanley G. Bird. Professor Banister Fletcher, the chairman of the education committee, in describing the work of the school, stated that 185 students were being educated there in all the trades associated with the building trade. In referring to the value of that instruction, he pointed to the testimony which had been given in regard to it by Mr. F. C. Penrose, the President of the Royal Institute of British Architects, who, after a visit to the school and an examination of the work, had said that the education given at the school could not fail to be of great service to those engaged in the building and kindred trades. Professor Fletcher mentioned the fact that all the tools at the school were made by the students, under the guidance of inspectors. Mr. A. Preston having spoken of the character and scope of the work carried on at the Carpenters' Company's Science School and Workshops at Stratford, the prizes to the successful students there, and the certificates gained at the Company's recent examination in sanitary building construction, were awarded. Dr. Wace, in his closing address, descanted upon the vital importance of the allied trades the labours of the students represented.

The City Commissioners of Sewers discussed at great length on Tuesday a report from the Streets Committee relative to the Central London railways and subways, and submitting for approval amended plans of the staircases at the corner of Princes-street (by the Union Bank), Queen Victoria-street (near the Poultry), and by the Mansion-house, subject to the works being carried out to the satisfaction of the Commissioners and without prejudice to the rights reserved generally by the Commission in 1893 to alter the position of any staircase or to modify the details in any particular. The committee recommended that before commencing the works for the purpose of the central station, subways, and approaches, the Central London Railway Company be required to deposit a sum equal to the estimated total cost of the works to insure their due completion. The effect of the alterations was that there would be separate staircases for up and down traffic at Princes-street and the Mansion-house corners, and at the Poultry corner the staircase would be partitioned in the middle so that the traffic would be divided. The changes would involve the projection of the present foot pavement at Princes-street by over 6ft., but the refuge in the roadway would be reduced considerably. The roadway itself would still be 26ft. wide. Mr. David Ross, the engineer to the Commissioners, said the land at this corner was estimated to be worth between £30 and £40 per foot. Eventually the adoption of the report was carried.

The Bill for the proposed London and South Wales Railway has been duly deposited in the Private Bill Office of the House of Lords. The measure differs materially from the plans and book of reference placed in the Private Bill Office of the House of Commons on November 30. According to the plans and book of reference, two alternative entrances into London were provided for. It was proposed, in the first place, to enter London by running powers over the new Manchester, Sheffield, and Lincolnshire Railway at Great Missenden and the Metropolitan Railway, while an alternative route was provided for by an independent line through Lisson-grove and St. John's Wood. In the Bill as finally deposited the latter route finds no place. The proposed new line will, if sanctioned, cross the Severn at Chepstow, where a bridge is to be built at a cost of close on £600,000. The line will pass through a rich agricultural country. The Great Western Railway Company have a competing scheme from Wootton Bassett to Chipping Sodbury, thence by one fork to Patchway, joining the main line by way of the Severn Tunnel, and another fork from Chipping Sodbury to Wickwar, and by way of the Midland over the existing Severn Bridge.

A course of twelve lectures has just been delivered at Darlington on "Mediæval Architecture," by Mr. D. H. S. Cranage, M.A., of Cambridge, under the University Extension scheme. Excursions were also made to neighbouring buildings to illustrate by examples the teaching of the lectures. At Durham Mr. Cranage lectured in the cathedral, and the same was done in the castle by Mr. J. P. Pritchett, of Darlington, who also, on Mr. Cranage's behalf, conducted the class to the churches at Aycliffe, Heighington, and Staindrop, explaining the various styles of architecture in each building. The closing lecture was given last Wednesday twice, to a class of about 100 each time, in St. Cuthbert's Church, Darlington, after which the class was divided into two parties of about 50 each, and whilst Mr. Cranage conducted one half over the beautiful chancel, Mr. Pritchett did the same with the other half over the grand transepts and nave, after which the parties exchanged places, and so every one had each part of this glorious building explained in detail.

The clerk to the Metropolitan Asylums Board, in a report to the board, states that during the past four years the managers have purchased five large sites for new fever hospitals—namely, Tottenham, Tooting (temporary hospital), ditto (permanent hospital), Lewisham, Shooter's-hill. On the first two of these sites they have already erected hospitals, the one in 1892 and the other in 1893. On the Shooter's-hill site a permanent hospital is approaching completion. On the Lewisham site a somewhat larger hospital is in course of erection, and is to be finished in 1897; and plans have been approved, and it is hoped that before long the building of a permanent hospital on the Tooting (permanent) site will be commenced. A site for the proposed southern convalescent hospital has not yet been secured. The managers have also during the same period been actively pushing on with most important and much-needed alterations, additions, and improvements in their existing hospitals, and have within the past two years taken important steps for the extension of their ambulance service. At two of the three ambulance stations enlargements and extensions have been carried out. They are also building a new ambulance station at Shooter's-hill, which is nearing completion. They have acquired sites for a new ambulance station adjoining the South-Western Hospital, and for a third new ambulance station adjoining the North-Western Hospital—plans for which have been already approved, and the building of which will shortly be commenced. For small-pox the managers have raised the permanent convalescent accommodation at Gore Farm from 600 to 1,000 beds, and have purchased a site for a new acute hospital. For imbeciles they have purchased a site at Tooting, on which a new asylum infirmary is to be erected.

Opinion was very evenly divided at the meeting of the Cumberland County Council on Saturday on the proposal for dismissing Mr. George J. Bell, the county surveyor. That official got himself into trouble over the proposed Sty Head Pass-road in a newspaper correspondence with Canon Rawnsley. In consequence of that the various chairmen of committees met, and decided that the offence was one that could only be met by dismissal from office. At the meeting of the County Council opinions were, however, very closely divided, and it was discovered as the meeting proceeded that there was just a probability that the motion would be lost. The county surveyor had influential backing from the west of the county, where the feeling in favour of the Sty Head-road was the strongest, and many councillors declared that the punishment proposed was in excess of the offence, and ultimately it was agreed that an apology would meet the deserts of the case, and this was accordingly given. The Sty Head-road question will now in effect be allowed to proceed, as the motion for delay was only postponed for a month by a majority of one or two, on account of this incident.

A distribution of medals and prizes gained by the students of the Glasgow and West of Scotland Technical College architectural classes (conducted by Professor Gourlay) at the Science and Art and the City and Guilds of London Institute examinations took place in the Andersonian Buildings of the College on the 10th inst. Mr. Thomas Russell, of Ascog, presided. Professor Gourlay said that in the honours stage of building construction 500 came up from all parts of the United Kingdom. Of that number 53 passed, and only three took first-class honours. Of the latter, who receive bronze medals, two were students at the College classes, and the other was a student in the classes a few years ago. Of the 50 second-class eight had been taken by the student of the College. In the advanced class 277 took first-class, and 19 were taken by their College students; while as regarded Queen's prizes of £2 each, he was informed that day that James Mather and John B. Robertson had been successful. In the City and Guilds examinations Mr. Thos. Brownlee had gained the silver medal and £3 in carpentry and joinery. Mr. John Honeyman, A.R.S.A., advised the students not to attach too much importance to theoretical knowledge gained in classes, as the knowledge gathered from their own experience produced the greatest results. The prizes were afterwards distributed, and speeches were delivered by Mr. David Thomson, late president of the Glasgow Institute of Architects, and Mr. T. L. Watson, F.R.I.B.A., of the same city.

The Lord Provost of Glasgow has issued his *résumé* of the new work of the Corporation of Glasgow during the year 1894-95. In Glasgow, with a population of 684,148, and a gross annual valuation of £4,218,580, the assessment per head is £6 8s. 3·88d.; while in Edinburgh, with a population of 276,297, and a gross annual valuation of £2,218,696, the assessment per head was £8 0s. 7·28d. The rate in the large English towns was as follows:—Liverpool, £6 13s. 1·41d.; Manchester, £5 9s. 1·40d.; Birmingham, £4 10s. 0·98d.; Leeds, £3 11s. 2·21d.; and Sheffield, £3 8s. 9·14d. Operations have been commenced in connection with the erection of a weir or tidal dam across the Clyde at Glasgow, and the corporation have also made additions to the open spaces of the city, the most important of which have been the acquiring of a new park at Bellahouston, 178 acres in extent, at a cost of £50,000; while Burnhouse Recreation Ground has been purchased for £30,000. The City Improvement Department have erected new tenements at a cost of £47,394 during the past year. In connection with the water-works, the Loch Katrine tunnel contract, the last of the seven sections into which the new aqueduct from Loch Katrine is divided, has now been let, the total cost of the aqueduct works to date being £631,000. Hydraulic power works were opened during the year in the city, and a new police establishment for the South side of the city was erected at a cost of £37,000. Sewer construction and Clyde purification have also engaged the attention of the corporation during the year. The statement concludes with a reference to the erection of new sanitary chambers at a cost of £30,000, and the erection of Ruchill Hospital at a cost of £170,000.

Trade News.

WAGES MOVEMENTS.

Stirling Painters.—The master painters of Stirling have agreed to the demand of the men for a nine hours' instead of a ten hours' day, and an increased wage of 7½d. per hour instead of 7d.

CHIPS.

An application to the Local Government Board by the urban district council of Stockbridge, near Sheffield, to borrow £11,668 for works of sewerage, was the subject of a Local Government Board inquiry on Tuesday.

The Arts and Crafts Exhibition Society announce that an exhibition will be held at the New Gallery in the autumn of 1896.

Col. Ducat, R.E., held an inquiry on Friday into the application of the corporation of Southend-on-Sea to borrow £1,600, £950, and £2,630 for purchase of land for erecting a depot, &c., for the construction of public conveniences on the Pier Hill, and for sewerage works in Leigh-road respectively.

At the Court of the Worshipful Company of Fishmongers, held at their Hall at London Bridge on the 12th inst., Mr. Howard Chatfeild Clarke, of 63, Bishopsgate-street Within, E.C., was elected surveyor to the Company.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

W. H. LASCELLES and Co.,
121, Bunhill Row, London, E.C.
TELEPHONE No. 270.
HIGH-CLASS JOINERY.
LASCELLES' CONCRETE.
Conservatories & Greenhouses.
WOODEN BUILDINGS.
BANK, OFFICE, & SHOP FITTINGS.
CHURCH BENCHES & PULPITS.
ESTIMATES GIVEN ON APPLICATION.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

***** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.**

Ashbourne, Derbyshire.—For the construction of the last section of the Buxton and Ashbourne Railway, that from Parsley Hey to Ashbourne:—

Naylor Bros., Leeds (accepted).

Beeston.—For two pairs of semi-detached villas, Beeston, Notts. Mr. C. Nelson Holloway, Newcastle Chambers, Nottingham, architect. Quantities by the architect:—

Cooper, J.	£1,705	0	0
Bell, A. G.	1,670	0	0
Hutchinson, J....	1,600	0	0
Cuthbert, T.	1,597	0	0
Donnelly, W., Kimberley	1,550	0	0
Fletcher, W., Beeston	1,500	0	0
Oscroft, J. (accepted)	1,500	0	0

Rest of Nottingham.

Cambridge.—For the erection of a villa in Cavendish-avenue, Cambridge, for Mrs. W. Varco Williams. Mr. Sidney French, M.S.A., Llandaff Chambers, Regent-street, Cambridge, architect:—

Thoday and Co., Limited (accepted)	£1,230	0	0

Chard.—For new premises, for Mr. E. Gawler, wholesale grocer. Mr. E. J. Symes, architect:—

Poole, A., Ilminster (accepted) ...	£550	0	0

FRIDAY, DECEMBER 27, 1895.

BOARD-SCHOOL ARCHITECTURE.

ABOUT Board-school planning we have heard a great deal, and we noticed last week a recent contribution to the literature of the subject by the clerk to the Manchester School Board, Mr. C. H. Wyatt. About Board-school architecture we hear much less. A word or two, tending rather to suppress it than to improve it, generally comes in at the fag-end of the planner's address, for the average Englishman cannot clear his mind of the delusion that to put down art is to promote utility. He thinks art means ornament, and he knows that ornament implies expense. There is no driving it into his head that good architecture is possible in plain buildings. The architect, to him, is simply a man who plasters on finery, and this finery often interferes with convenience, and always raises the rates. It is natural enough, therefore, that he should object to the architect and all his works, and do his utmost to keep him under.

That is one reason for the rampant ugliness of so many Board schools; the school boards love to have them so. But there are other causes besides. There is a tradition—less dominant by far than it was a century ago, but still dear to many minds—that, to educate children, they should be made as dismal as possible. At this moment, for instance, a majority of the London School Board is in favour of beating little girls, though, fortunately, the higher authorities prevent it from putting its principles into practice. But this is only an extreme example of the vulgar belief about the right way of training the young. The thing to aim at everywhere, on this theory, is to repress their instincts—to "break their wills"—and, generally, to surround them with all that is lowering and depressing. If they have any natural taste for the beautiful, that taste must be destroyed; if they have any favourite studies, those studies must be discouraged. Every child is to be turned out, at the end of his course, as much as possible like every other child. He must be taught the same things, and be left ignorant of the same things, and he must acquire his knowledge and preserve his ignorance in the same repellent sort of soul-factory or mind-mill.

We all know the London type of soul-factory. It towers, every quarter of a mile or less, above the smoky streets and squalid homes which supply it with its raw material. We know the stock-brick facings and its red quoins, and its little bits of "Queen Anne," or worse than "Queen Anne" detail, tacked on at random here and there. We know its utter lack of general composition—of grouping—of all that produces unity and individuality. We see at a glance that it was devised in the happy-go-lucky way so pompously enforced in the preface to the Education Department's Rules. "The school architect is recommended first to perfect his plan. His own skill should then enable him to clothe it with form, proportion, character, and colour." This is not the way of the real architect in any age or country: it is simply the way of the planner, who has never discerned what architecture is. The planner arranges his plan, without a thought as to what he is going to do with it. How he is going to roof it, how its various parts will group, what sort of a whole it will make, or whether it is possible to make it into a whole at all, are things that never trouble him. He fancies, perhaps, that he can "clothe it with form," as the Rules encourage him to do, after its shape is practically settled. But he finds that form depends quite as much on plan as on elevation. He made his plan without considering "form," and form will not come to him afterwards, just because he wants it. As to "proportion," the Department's other rules do not leave him much choice. His rooms must not be too high or too low; and he must not add needless features to break up his skyline. "Colour" does not count for much in smoky towns, where a very few years bring most colours to the same tone; and the end of it is, that in "character," one school is so much like another, that nobody knows, or cares, whether he has or has not seen it half-a-dozen times before.

This is what most London Schools, and those of the more crowded suburbs, have generally come to. There are some exceptions, of course, which possess individuality of character. They may be found amongst the schools which were built by the London Board before it set up an architect of its own, and gave him more to design and superintend than any mortal man could design and superintend satisfactorily. We all know how it reaped the reward of its folly in failing foundations, choking drains, and cracking walls; and, in money alone, probably lost more than it had saved. In arrangement and practical fitness the harm it did has not ended yet, nor will end for generations. We heard, little more than a year ago, from the present architect to the London School Board, that a multitude of its structures had been arranged in ways now recognised as highly objectionable. They cannot be pulled down; they can seldom be much improved. They are built, once for all, and teachers and scholars must make the best of them. It was not any want of ability, nor, we may venture to say, any want of care, on the part of the Board's former architect which produced this unfortunate result. It was simply that he and his clerks were kept, year after year, working against time, and turning out school drawings wholesale, so that they had no leisure to think or ascertain whether their stock type of school was a great success or a partial failure. The same cause must be largely responsible for the poverty of their designs, looked at architecturally. They are not as good as their maker could have designed—far from it, though some of them do bear traces of his skill; but, broadly speaking, they are only as good as he could do at high pressure. Taking them all together, they are an illustration of building in haste and repenting at leisure—an object-lesson on the effects of being penny wise and pound foolish.

It does not trouble the public how bad a thing is, provided it gets into fashion, and is upheld by authority. Therefore it is a matter of course that the typical London Board school, raising itself unabashed all over the Metropolis, and tacitly asserting itself to be the crowning result of time, should be taken by many people at its own valuation. Dingy stocks and red-brick quoins have in this way been recognised by country Boards as the only correct wall facings, and have been imported at considerable expense into villages whose local materials were incomparably better. With them have come broken cornices, gable copings, parapets, and lead gutters, and a variety of other costly and useless details, without which no board school seems to be considered complete. All these things, along with the rigid, unadaptable rules of the Department, swell the expense, in rural neighbourhoods, to a perfectly needless point. The country board school, often enough, is a manifest exotic; something imposed by outsiders on the district, and no natural product of the soil. So it happens that though it is commonly lower and less box-like than the town one, and is, therefore, more amenable to really architectural treatment, it becomes an eyesore, and not an ornament. There are numerous exceptions; but this in the general tendency, and the man who opposes it is looked upon as an enemy to education, and a person altogether behind the times he lives in.

In this way it comes to pass that one great part of our annual taxation goes to nullify the good which is being done by another part. We have a Science and Art Department doing its best to cultivate popular taste, and to restore to our country the faculties and perceptions which, for a great part of the last three centuries, it made almost a religion of repressing. This is an uphill task at the best, and it is made immensely harder by the fact that the Education Department, in reality, if not in form, is fighting against it. An artistic training means a training amongst all that is natural and beautiful and free. A Board-school training very often means a training amongst all that is ugly and mechanical and discordant. It is as if one department existed to teach music, and another department seized on the students and compelled them for five or six hours a day to live amongst steam-whistles and saw-sharpeners. For the typical Board school is seldom more lovely inside than out. It is an "education Bastille," to adopt Carlyle's phrase, and a place of durance in which, as a building, there is nothing to delight the eye or to elevate the mind. Physically and materially it may have its merits. Light and warming and ventilation are carefully provided for, as it is right and necessary that they should be. In points like these the modern Board school is far in advance of public schools like Eton and Winchester, whose desks and forms would be looked on with contempt by the London street-boy, and whose wildest dreams—at any rate, a generation ago—did not rise so high as having "hot and cold water laid on." The Education Department and the Boards can appreciate the mechanical, the physical—the things of the body. What they ignore are the things of the mind, and, above all, the higher things which cannot be taught in classes or comprised in standards. There is no communicating them in words; but they teach themselves by the influence of beautiful and refined surroundings. There are places, to have lived in which is a liberal education. A Board school should do its best to be one of them; but how many of such schools have as yet even imagined this as a possibility?

There was a story—probably apochryphal—in the newspapers last week, of a little girl ten years old, who was asked what subject she was then studying at the Board school. She replied: "Seismology," the science of earthquakes. It is, or—when more is known about it—may become, a very useful and interesting thing to learn about for pupils in Japan, and in some parts of South America; but, in any case, it can hardly be taken up with advantage at the age of ten. Yet long before that period, as every observer knows, external impressions do much to shape a child's tastes and preferences—so much that the result of its early surroundings is generally traceable through life. What a child becomes depends more largely than most people think on what sort of place it grows up in, and refined and beautiful schools may do as much for education in one of its aspects as masters, mistresses, and inspectors can ever do for it in another.

AMBIGUITIES IN THE LONDON BUILDING ACT.

THE paper read by Mr. Ellis Marsland under the title of "A Year's Work under the London Building Act of 1894" before the Society of Architects is interesting to those who have been watching the operation of the new Act to buildings in the Metropolis. The amendments incorporated in the new Act have not all been desirable; many of them were proposed at the last moment by opponents to the Bill, and by others having large interests as building owners, and the consequence is that what might have been a useful measure of consolidation has been narrowed and watered down to meet a number of conflicting interests. There are a great many ambiguities in the Act as it stands which will sooner or later have to be expunged. The courts of law have already dealt with a few of them, and we may expect many more legal interpretations to be given before the Act is put in working order and Parliament is asked to revise it.

The concessions made by the framers of the Bill at the time of its drafting to opponents and vested interests have, it must be confessed, greatly impaired the integrity and definite wording of the clauses of the present Act, and the recent questions which have come before the law and police courts show how imperfect and equivocal some of the sections are. To take, for example, the first section cited by Mr. Marsland, the 212th, referring to buildings in progress at the commencement of the Act, it is obvious, as we have before said in referring to cases brought before the magistrate, that the clause does not clearly define the two kinds of contract. The section as it is now worded is ambiguous. It says: "Notwithstanding anything contained in this Act, a building, structure, or work which has been commenced before, and is in progress at the commencement of this Act, or which is to be carried out *under any contract* entered into before the passing of this Act, may be completed subject to, and in accordance with, the provisions of the Acts relating thereto as in force immediately previous to the passing of this Act." The italicised words "under any contract" are vague, and, as the decisions have shown, may apply to ordinary building agreements to build so many houses on a given site. No doubt the framers of the section had in view a contract entered into by a builder to erect a specified building. The law courts have put another interpretation upon the clause: they allow houses to be erected under the old Act if only an agreement for their erection has been executed before the 25th of August, 1894. Professor Banister Fletcher said he pointed out, at the time the Bill was in committee, the confusion that would arise; but counsel's opinion was adopted. Any unnecessary interference with the arrangements of owners and those who had taken land under the former law would be unjust. The recent appeal case, "Tanner v. Oldham" may be cited. An agreement in writing dated Jan. 3, 1894, was entered into between the Haberdashers' Company and a builder, the latter agreeing to erect upon certain plots of ground several houses, six of which were to be completed before 25th of March last. Due notice of building was served on the district surveyor, but the latter decided it would be contrary to the Act as to thickness of walls, and gave notice of objection. The respondent appealed to magistrate, and relied on Section 212. The appellant contended that the section applied only to a contract for the erection of a specific building at a given price; but the magistrate was of opinion that the agreement was a contract within the meaning of the section, and disallowed the objection. The Court decided that the magistrate was right. The section related to a "building, structure, or work" carried out under a contract, and the word "contract" could not be narrowed down to a specification, though it might be part of a contract.

The discussion on Section 13, clause 5, referred to in the paper, also points to a defect in the framing of this clause. As our readers will see if they turn to the above subsection, the Act permits the re-erection of a building that is within the prescribed distance from centre of roadway (when the evidence of the position of the old building or the plans and extent of the forecourt, &c., have been found to be accurate by the district surveyor and certified as correct), but "so that no land within the prescribed distance shall be occupied by the re-erected building or the forecourt," &c., except that which was occupied by the previous building or forecourt. But, as pointed out by Mr. Marsland, there is no restriction as to the height of the re-erected building, which may be built presumably to the full height of 80ft. We can imagine an old building of one or two stories re-erected under this section to such a height as to make it objectionable to the adjoining owners, who apparently would be powerless to interfere. The discussion on this point elicited the opinion of Prof. B. Fletcher that when the street was 40ft. wide the new building could not be raised higher than the old one, but there is nothing in the Act, as far as one can see, to indicate any restriction as to height.

Referring to Section 40, the author of the paper drew attention to the unsatisfactory wording of the clause. The section provides for light and air to habitable basements; but it practically says nothing more than that there shall be in the rear of the building an open space of not less than 100sq.ft., which "need not adjoin the rear boundary of the premises." The area, too, is small. In the next section (41), relating to space at the rear of domestic buildings abutting on new streets, the remark made by Mr. Lovegrove is to the point. It enabled the owner to build over the space at the back to a height of 16ft. above the pavement (see sub-clause i.) when the ground story is not inhabited. We have spoken before of the effect and inadequate provision of this important and lengthy section, and we agree with Mr. Marsland in thinking it is a pity that the same condition should not apply to a new site on an old road instead of permitting the diagonal line to be drawn at the level of 16ft. above the pavement, and the open space to be provided at this level. The provision is not sufficient, and we cannot see that the rule will afford buildings under certain conditions any greater advantage in respect of air and light than was originally given.

In the next section (42) the wording is also vague as to open space to be provided for dwellings for the working classes not abutting on a street. Why a stable abutting on a street is deemed a domestic building is beyond comprehension. Where, as one speaker said, the stable did not abut upon a street, a difficulty would arise as to space in the rear. What is the definition also of "working classes" in this section? Section 43, which relates to re-erection of a domestic building on old site, is not very explicit. Plans of the previously existing building have to be certified by the surveyor, and if he is satisfied with their correctness the person may erect the domestic building, but so that no more land shall be occupied by it than was occupied by the previous domestic building; but as to height there is nothing stated, though in the draft Bill the height was not to exceed that of the old building.

Section 45, relating to courts within a building, must have caused some difficulty to architects as to how the communication between the lower end of the court and the outer air is to be effected, except by a space left over the ceiling of the ground floor in one of the rooms. A diagram explaining how this can be managed would have saved much trouble. As to another important section, 74, the new Act has not simplified the question of the separation of buildings used in part for purposes of trade and in part as a dwelling-house. We refer to Mr. Marsland's remarks and the discussion thereon. As Mr. Lovegrove said, the section was a very difficult one to work under in the case of alterations. In the first place, the section only applies when the new building exceeds 10 squares (1,000sq.ft.); but it also applies where two buildings are united and used for dual purposes. A small addition to any old building of this area may bring this clause into operation, as we find clearly stated in Section 77, 2. Not even by dividing the building into sections of not more than 1,000ft square, and placing iron doors to the openings between them, can this section be complied with. The difficulty, therefore, is to make united buildings comply with the Act, and for this purpose walls and floors of fire-resisting material are to be used; but the thicknesses of these party-walls and floors are not stated. Then what interpretation is to be put on the words "all passages, staircases, and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials" in the case of two old buildings united? We can understand a new building with these arrangements; but to make united buildings comply would mean a very extensive reconstruction and outlay. Then the part used for trade, if exceeding 250,000c.ft., is to be subject to the provisions relating to buildings of the warehouse class. It appears to us that the whole of this section requires remodelling. It is quite obvious that the framers intended that the passages, staircases, and other means of approach to the dwelling portion of the premises should be of fireproof construction. Mr. Marsland refers to other defects in the description of the doors in the vertical walls of separation, which will cause considerable difficulty to owners and district surveyors, and give the Courts much trouble where any case of disagreement arises about the kind and thickness of walls and floors separating the two parts of such buildings; and the question of joists is doubtful. The next section (75) has a new clause which makes it impossible for any warehouse to be enlarged so as to make the cubical contents exceed the statutory limits of 250,000c.ft., and the mode of division is by party-walls only. We cannot see why the old maximum limit of 216,000c.ft. was raised.

We have no space to examine other points. Section 80, as to rules for staircases in churches and chapels, &c., is a considerable improvement upon the old; but the remark was made that no width for entrances and exits is given. Attention was called to the exemptions from the Act (Section 201), and the general opinion of district surveyors is that a mistake was committed in exempting greenhouses not attached to other buildings, although the rule agrees with the decision in "Hibbert v. Acton" that ordinary greenhouses are not buildings within Section 157 of the Public Health Act, 1875; it is also objected that anyone can erect a greenhouse close to his neighbour's boundary. These and other points are unsatisfactory.

RIGID RESTRICTIONS.

COMPLIANCE with the narrow demands of building promoters cannot be very conducive to that freedom of design which a competition by its very nature presupposes. Every restriction puts a limitation on the design, and fetters the thought and imagination of the architect. The old saying that "The letter killeth, but the spirit giveth life" is particularly applicable to those rigid instructions and conditions which committees sometimes impose on the profession. That certain desiderata in the plan should be fixed no one will dispute. The accommodation, the size of certain rooms, the number of offices required in particular departments, and the demand for entrances and exits are absolute requirements. Even a rough programme or sketch is tolerable when it does not go so far as to hamper the ideas of the competitor; but when it restricts the architect to one mode of planning, or preclude him from exercising his own skill in accomplishing the same ends, it is inimical. An assessor, for example, by enforcing a particular condition of the instructions, may do the same wrong to competitors. He may, for instance, take a too literal interpretation of a condition by insisting that the public hall be placed in a particular position, thus throwing out a design which shows a better position for it in reference to entrances and exits. To the expert designer of a particular class of buildings, this rigid enforcement of conditions is positively distasteful, for it often positively debars him from exercising his own skill, and introducing features and arrangements which long experience has proved to be desirable. Thus, recently in the case of certain baths and washhouses, a very able set of designs failed to obtain the first place because its author boldly introduced a feature which was not contemplated by the promoters who drew up the conditions, and ventured to make a few deviations from the schedule of accommodation. Though these departures would have been a distinct gain to the convenient approach to the baths, they were considered by the assessor as unnecessary.

Broadly, the question of competition conditions resolves itself into: Is the object to obtain the best design practically and artistically that can be made for a given site and at a given cost?—or is it to select a design on paper which complies with a set of conditions which do not pretend to be perfect, which are, in fact, drawn up by a few of the committee with the aid of their surveyor and clerk, or with the aid of an assessor who is not an expert in the class of buildings contemplated? If the latter, then the rigid observance of the conditions, however imperfect, is a *sine quâ non* of all architectural competitions, and the idea of obtaining the best design or the highest talent procurable is a mere subterfuge? But surely no set of promoters of a competition desire to do anything else but to procure the best design.

The history of not a few recent competitions has shown that promoters expect architects to compete under severe and often unreasonable conditions, which they do not guarantee to maintain themselves. How often have committees accepted designs which have violated one or more of the leading conditions, or have selected a design which they know quite well will cost a great deal more than the amount they have stipulated! The King's Lynn Municipal Buildings competition, the award of which dissatisfied a few, and which called forth remarks in our Correspondence column, may be mentioned; also the Durham County Council offices competition, in which the assessor's award was practically set aside. Into the merits of these competitions we do not say anything further than that the question of cost was made paramount by the council, and a good internal arrangement has been selected in the latter instance. There are many instances of architects wilfully or unknowingly transgressing the conditions of competition, for which no excuse can be pleaded, and which fairly disqualifies their designs, as when they go beyond the limits of the site; when they exceed the dimensions unnecessarily, or do not give the required accommodation; when they place offices or departments on the wrong floor; do not provide the required entrances or exits; introduce corridors or halls that cannot be lighted; when they exceed the cost, or do many other things contrary to the express or implied meaning of the instructions. In these instances the committee or the assessor are justified in rejecting their designs. A competitor places himself out of court by not complying with the terms of the competition, and he cannot justify his neglect when the conditions are clear and definite, and other competitors have fulfilled them. On the other hand, there is a free interpretation of the conditions which every professional man is justified in exercising. If a competitor does not violate any essential point, but, in the exercise of his judgment, introduces a modification which gives the same result in another way, it seems to us the assessor is bound to consider it upon its merits. It may be a better or a worse way of doing something, and as such it ought to be examined.

Let us take a few cases that have occurred in actual competitions, in which competitors have exercised their own judgment in interpreting the conditions. The promoters propose that the whole area of a given site is to be covered by the building, except certain small areas for light; but they do not make the condition absolute. One of the competitors, instead of conforming rigidly to the instruction, introduces a quadrangle for light and air, which absorbs a considerable space in his plan. To obtain the necessary accommodation, he places some of his inferior rooms in a third story or a mezzanine. Is such a proceeding a violation of the instructions? A better and more architectural plan is obtained at the cost of putting a few of the minor offices on another story than that scheduled. It will scarcely be maintained that, if his design is made better by such a modification, this plan should be disqualified, although other competitors who have followed closely the instructions may regard it as an infringement. In another competition, designs were invited for a building on a site the building frontages of which were laid down, but nothing was said to restrict the architects. One or two designs submitted showed the building kept considerably within the boundaries; on one side a large area was left, and the authors added a story. We think the design was rejected on these grounds, though the authors complied with the general conditions as to accommodation. Frequently we find the following:—The plan of site has irregular angles and boundaries, which are supposed to be built up to; but a few of the competitors venture to set back their main frontages, and to design a square-angled building. What is more reasonable? Are these designs to be rejected on this account?

Again, A. is a design submitted which in all main essentials complies with the conditions; the departments are well grouped and located, and the entrances are sufficient and well studied, but the accommodation in one department is not given as asked for. Another competitor, B., supplies the accommodation asked for, but his entrances are cramped, and his corridors badly lighted. Which should be selected? A.'s design is in every respect better as a plan, and his elevations are suitable; B.'s design blindly follows the schedule, but his plan is inferior, and his external design elaborate, but not adapted to the buildings. Then take another and not uncommon case. The conditions lay down that the architect of the successful design is to obtain at his own cost a *bonâ-fide* tender from a well-known contractor approved by the commitee to carry out the work for the amount of his estimate. The author of the best design fails to obtain such a tender. In the Durham County Council Competition one clause stated "that if the estimate exceeds £22,000, the design will not be eligible for a premium, and special consideration will be given to plans which can be carried out at the lowest cost." Many competitors accept such a condition with reserve. They can call to mind numerous cases when the promoters have disregarded this stipulation when a really good design has been selected; they look upon the clause merely as a kind of loophole, or as a means of keeping down unnecessary expense, and not one that will be seriously acted upon when the cost is not extravagantly in excess of the amount. As a matter of fact, a very large percentage of competitive designs selected exceed the stipulated sum. When it is intended to adhere to the amount, a statement to this effect would save many disappointments and unnecessary labour. All the above cases, except the last, are instances of a free interpretation of the conditions, in which the authors have shown skill and artistic ability. As to the clause now so often inserted, that the successful competitor is, at his own cost, to obtain a *bonâ fide* tender from a builder to carry out the work at the architect's estimate, nothing can be more derogatory to the artistic and professional minds, as it practically converts the architect into a contractor. The effect of this restriction is to tie the designer's hands and prevent him from fully developing his scheme; his design must suffer in the long run—details are cut down or spoiled. For, in most cases, the sum put down is far from being adequate, and has been fixed without any due consideration of the requirements. Such has been the case with the sum put down by the Shoreditch commissioners for their baths and library. Why should an able design be hampered by an ill-considered estimate, which, in nine cases out of ten, has to be increased? Mr. Penrose, in his presidential address at the Institute, observed that it can hardly ever happen that "any set of conditions and instructions issued by a committee can supply competing architects with all the information required for forming a successful plan, at all comparable to the free intercourse of an appointed architect with his employers." We may go further, and say that a set of conditions prepared by a committee, or an assessor, is insufficient to supply a competing architect with any information beyond the barest requirements, and even these may be often unattainable or impracticable, and that the fuller and more detailed they are, the more irksome they become. Every competitor knows how hampering and restricting the effect is of a large number of conditions and a long schedule, and at almost every step in the planning, a question occurs which must be answered. The list of questions and answers often published as an additional sheet of information after the plans are far advanced, show how imperfect the conditions generally are, and how much less friction, and more freedom of thought would be insured by leaving all unessential points to the competitors. No doubt, to some of the inexperienced and incompetent competitors of complex buildings, very full and definite instructions are helpful; but they are just the men who are most hampered and restricted by them, and they stumble and fall over points which their better informed brethren avoid. While one gropes his way in the dark, following, as far as he can, the instructions, the other makes rapid strides, and is more impeded than otherwise, by a number of restrictions which may turn out to be impracticable, or inconsistent with other conditions. The question remains, Is the most compliant fulfilment of the conditions, or the best building which architectural talent can produce, the chief consideration? So far as our experience goes, the two things are irreconcilable. The most perfect fulfilment of conditions as generally framed by committees, does not insure the best plan or the most effective design. All the former can do is to lay down a minima of requirements; whenever more is attempted, the highest skill in planning and the dearest artistic discernment are placed at a decided disadvantage, or are absolutely thrown away.

◆

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—XI.

By Joseph Horner.

I HAVE made frequent allusions to the important differences between the upper and lower portions of castings, and have explained the reasons for these differences. A practical man would always, when inspecting work, try to locate each before making detailed observation. The upper and lower parts of a casting may almost always be distinguished, even after it is fettled, in the following way:—

The runners generally come down somewhere on the top, and then the marks where they have been chipped off can always be distinguished from the untouched skin of the casting adjacent. If, however, the runners have been brought in at the side of the casting, then marks of chipped off risers can be distinguished, and these are invariably on the upper surfaces of castings. The sectional forms of these are either circular or rectangular. These signs are sufficient. But a practical eye can often tell the top from the bottom by slight differences in the appearances of the surfaces. The top is seldom quite so smooth and even as the bottom. But the runners and risers are sufficient indication.

The parts where the mould has been jointed can almost always be detected by the signs of minute overlapping, and of fins chipped or ground off. It is often useful to note this in determining which is the top and which is the bottom side of a casting.

Where a casting has been poured on end—that is, cast vertically—the runners will be brought in either at top or bottom, and their marks will be detected accordingly. Even if the ends of such a casting have been machined, the way in which it was cast will still be evident by the absence of the marks of chipped-off runners and risers on the sides.

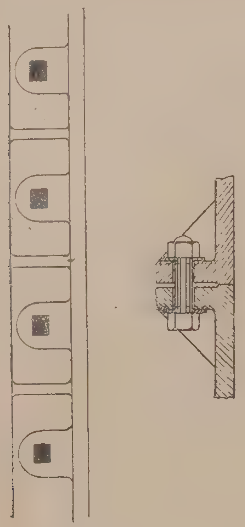

FIG. 45.

I will now give some selected illustrations which will show the importance and the practical applications of some of the principles and facts which have formed the subject-matter of foregoing articles.

To take first a piece of history, terribly memorable in the annals of engineering:—

On the evening of Sunday, December 28, 1879, the most terrible railway bridge accident ever recorded in this country occurred. On that night a portion of the first Tay Bridge went over into the river with a train of about 70 passengers, who had left Edinburgh for Dundee. The bridge had been erected at a cost of about £350,000 by Messrs. C. De Bergue and Co. and Messrs. Hopkins, Gilkes, and Co., of Middlesbrough, and it had been opened only on the May twelvemonth previous. The bridge was 10,350ft. long, and carried a single line of rails. The columns of the Tay Bridge at the piers which failed were in groups of six, arranged at the corners of an irregular hexagon, each column being made of seven lengths 10ft. 10in. long, united by flanges. Four were 15in. diameter, two 18in. diameter, filled with Portland-cement concrete. They were braced with horizontal and diagonal bracings, the latter being attached to cast-iron lugs or snugs, with bolts. The bolts were $1\frac{1}{8}$in. diameter, the snugs 1in. thick, $1\frac{1}{2}$in. apart, and the holes in the snugs were $1\frac{3}{8}$in. diameter. The columns were about as bad as castings could possibly be. They were made of bad iron, badly moulded, cores out of centre, no chaplets being used, scabbed lugs were imperfectly burnt on, cracking the columns, and there were cold shuts. Cracks were filled up with putty, and holes with Roman cement. The bolts in the lugs for securing the bracing were slack in their holes, and the salt-water had corroded them seriously, half-way through in some cases. It came out in evidence taken in connection with the failure, that some columns were only from $\frac{3}{8}$in. to $\frac{1}{2}$in. thick on one side, and $1\frac{1}{4}$in. to $1\frac{3}{8}$in. on the other. Also, that lugs were sometimes burned-on, when it was known from the quality of the metal that the job could not be solidly done. That in cooling, the lugs sometimes came away from the flange, but adhered to the column. It was a miserable history of a bridge badly designed, badly built, and badly maintained, and it created a prejudice against the use of cast iron which the material, if employed under suitable precautions, does not deserve.

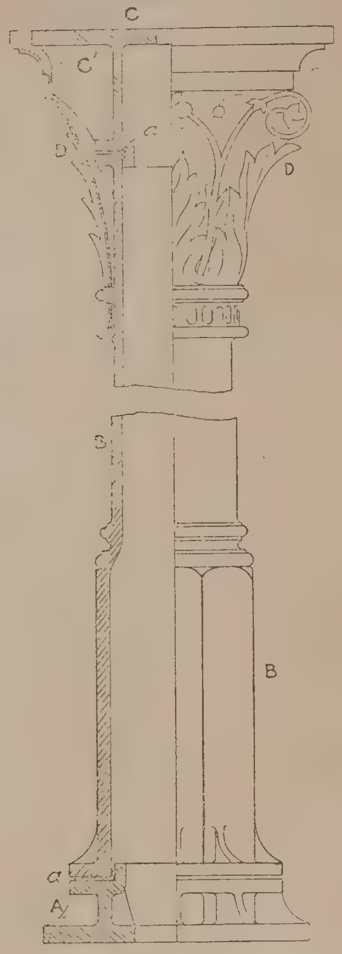

FIG. 46.

From many of the remarks in foregoing articles relative to shrinkage stresses, the reason is explained why it is the practice to build up some heavy masses of cast iron in several pieces bolted together, rather than to attempt to cast them in one. Some disproportioned castings would become torn asunder by their own shrinkage; others, if not actually fractured, would be within an ace of being so. Besides this, too, the cost of moulding is increased by casting large masses of metal in which great differences in dimensions occur. The moulding flasks, with their contained sand, are more awkward to handle, and the risk of wasters is increased.

In cast-iron tanks, for example, the plates are seldom larger than 4ft. square, being then easily cast and handled about. Large columns with broad bases and caps are cast in several parts and bolted together—the shafts sometimes in several lengths, and the bases and caps distinct. Heavy mouldings are not cast, but screwed on. The joints between the different parts are not necessarily faced right across. It saves expense, and makes practically as good a job to have narrow facings only and fill up spaces with iron cement, as in tank plates.

Fig. 45 shows the regulation method of making the bracketed flanges for cast-iron plates of all kinds, whether for tanks, buckle-plates, or other broad surfaces in cast iron. The flanges are bracketed strongly to resist the cross breaking stresses due to the pull of the bolts. A small radius, too, fills up the angle. The bolt-holes are either square or oblong—the proper form being oblong, as shown. The excess of length over breadth may range from $\frac{1}{16}$in. to $\frac{1}{8}$in; but, though apparently small in amount, it is always well to make this difference. The reason is, that the coring of the holes to exact centres cannot be relied on, and if the holes overlap slightly, the chances are that the bolts cannot be got in without some time wasted in enlarging the holes by chipping. Casting the holes oblong gives a slight excess of clearance in the direction in which the holes are most likely to be out of truth—that is, lengthwise. In the other direction, that of depth, the holes are usually from $\frac{1}{16}$in. to $\frac{1}{8}$in. larger than the bolts—no more. It is customary to cast square holes and to use round bolts with square necks. It is not necessary to cast square holes in both flanges; but it is convenient to make all flanges alike. Thin facings are, or ought to be, cast around the bolt-holes for the bolt-heads, or nuts, or washers, to bear against. There is generally quite $\frac{1}{16}$in. of taper on the inner faces of the flanges, and this prevents the nuts or heads from bearing all over their surfaces.

When facings are cast on, less taper is given to their faces than to the faces of the flanges, and the bolts have a better bearing. Washers are, or should be, always inserted between the nuts and the facings. If the job is a water-tank, gromet washers are used under the heads and nuts, consisting of a strand of tar twine rolled round into a ring to encircle the bolt.

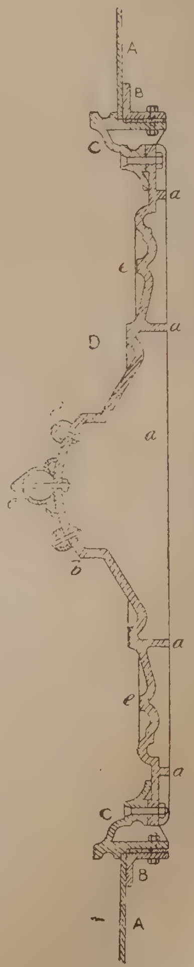

FIG. 47.

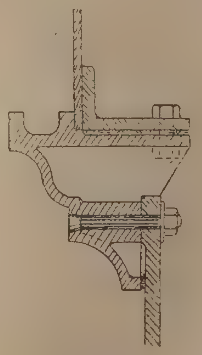

FIG. 48.

A fillet is always cast round plates of this kind, and ought to be planed. In casting the narrow fillet, there is a space left between adjacent flanges, usually from $\frac{3}{8}$in. to $\frac{1}{2}$in., and this is filled up with iron cement, consisting of fine borings and sal-ammoniac moistened with water. This soon sets nearly as hard as the iron itself.

Fig. 46 represents one of the columns of the Liverpool Central Station in half-elevation, and half-sectional elevation. It is selected as affording a good illustration of the manner in which heavy cast-iron columns are built up. The upper circular part of the shaft tapers from 1ft. 9in. to

PORTICO OF ST. PAUL'S CHURCH, COVENT GARDEN.

1ft. 6in., and the lower hexagonal part is 2ft. 3in. across, and the total length over base and capital is 27ft. A column of this type cast in one would be costly to mould, and would possess several elements of weakness, due mainly to the shrinkage stresses already enumerated in previous articles. This, therefore, affords a good object-lesson of the manner in which large columns are built up in order to minimise the evils incidental to work cast in iron. The base A, shaft B, and capital C are made separately, because of the great disproportion in the dimensions of each, and the foliage D round the capital is cast in separate pieces and screwed on. When heavy foliated work is cast on a capital of large dimensions, there are two evils to contend with: one is the shrinkage stresses and draws which occur, due to the unequal massing of metal; the other is the increased difficulty of constructing the pattern and withdrawing its various sections from the mould. With regard to the first, it is well-nigh impracticable to make cores to follow the outlines of the foliage, and so preserve that approximate uniformity of thickness of metal which is so necessary to insure equal cooling and shrinkage. With respect to the second, the task of constructing a pattern for easy withdrawal is often a most troublesome one. In a large ornate capital the number of separate pieces, large and small, will often number two, three, or four dozen. These all have to be jointed before the carving is done, so that the pattern-maker must needs see, mentally, the moulding of everything clearly before he commences working. And even then some of the details often have to be modified, and some sharpness of outline sacrificed to the exigences of delivery. Then there are the moulder's joints, which show to a greater or less extent in the casting, and have to be trimmed and smoothed. But by casting the foliage in iron or brass, and screwing it round the cap, much of this trouble is avoided, and the metal is maintained of approximately equal thickness. Ribs, it will be noticed, are cast on at C^1 to form suitable projections for the attachment of the sections of foliage. The joints between the main parts of the column at *a*, *a*, are usually made good with iron cement.

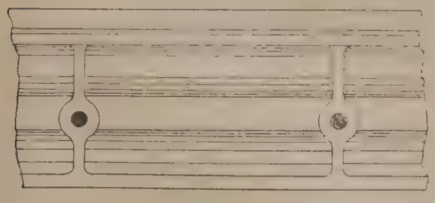

Fig. 49.

Fig. 47 gives a vertical section through one of the ornamental spandrels of Battersea new bridge, selected to illustrate the way in which large areas of ornamental work and heavy mouldings are built up. The section is taken through the shield at the centre span, representing, therefore, nearly the deepest section of the cast work. The outline of each spandrel is, but for the rise and curvature of the spans, that of a right-angled triangle, the length of the upper side of which measures about four times as much as that of the perpendicular, and each is made of four cast-iron plates flanged, bolted, and cemented, and strongly ribbed. It is not necessary to illustrate this. In Fig. 47 A A are steel plates which serve as a connection between the spandrels and the top and bottom main girders of the bridge. Angle-irons, B B, are riveted to these. The cast-iron mouldings C C are bolted to the angles with iron cement joints, and the spandrels D are bolted behind the mouldings. *a a* are stiffening ribs cast on the backs of the spandrels, *b* is the shield having bosses, *c d d*, bolted to it, *e e* are sections through ornamental scroll-work.

The noteworthy points about this design are the way in which equal thicknesses of metal are preserved throughout, and the method adopted of casting parts separately. To attempt to cast the mouldings on the spandrel would give infinite trouble in cooling. To cast the bosses *c d d* on the shield would give trouble in moulding, and draw the casting there. By adopting the method shown, the shape and strength of each section is preserved intact. A moulding is shown in detail in Figs. 48 and 49, in section and back view. Always, when mouldings are bolted to other work, bosses and ribs are used for the bolts, so that there shall be no important excess of metal in any one section. The joints are made with iron cement.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XXII.—ENGLISH RENAISSANCE.—THE WORK OF INIGO JONES AND WREN.

THE true Renaissance was introduced into England so entirely by two men only, and these two of such high genius, that it is necessary to treat their works separately from all else.

First of these came Wynw (or Inigo) Jones, the Welshman, who lived during the reigns of the first James and the first Charles, and who imported into England, almost in their purity, the characteristics of the Venetian School, which he had learned to love when travelling in Italy; and he was followed, after the interval occupied by the Civil War, by Wren, the astronomer, whose extraordinary genius enabled him to produce works of the highest order and magnitude with little or no training in architecture.

Of Inigo Jones's buildings, there is no question as to the projected palace at Whitehall having been the most important, as the portion of it erected, and now forming part of the home of the United Service Institution, is undoubtedly the most noble and most characteristic piece of his work still left to us—for the villa at Chiswick, often ascribed to him, was not even projected till long after his death.

In the Whitehall example there is a plain basement, then an Ionic, and over that a Corinthian Order, the columns being sufficiently widely spaced to allow of windows being introduced between, the four in the centre being true columns with the entablatures breaking round them, and the others being pilasters of no great projection, those at the corners being coupled in order to give a greater idea of support.

The most unusual feature, and consequently that which most deserves attention here, is the treatment of the Ionic capitals, with all the volutes projecting diagonally from the face, and without drums, faces or fronts being thus formed on all three exposed sides. To find a precedent one has to go back to the Temple of Apollo Epicurius at Bassæ, built by Ictinus about 438 B C., with which Jones could scarcely have been acquainted. Where a similar treatment has been adopted to the coupled pilasters at the

OLD BANQUETING HALL, WHITEHALL.

angles, the effect is not altogether pleasing, though doubtless it was necessary for the sake of consistency.

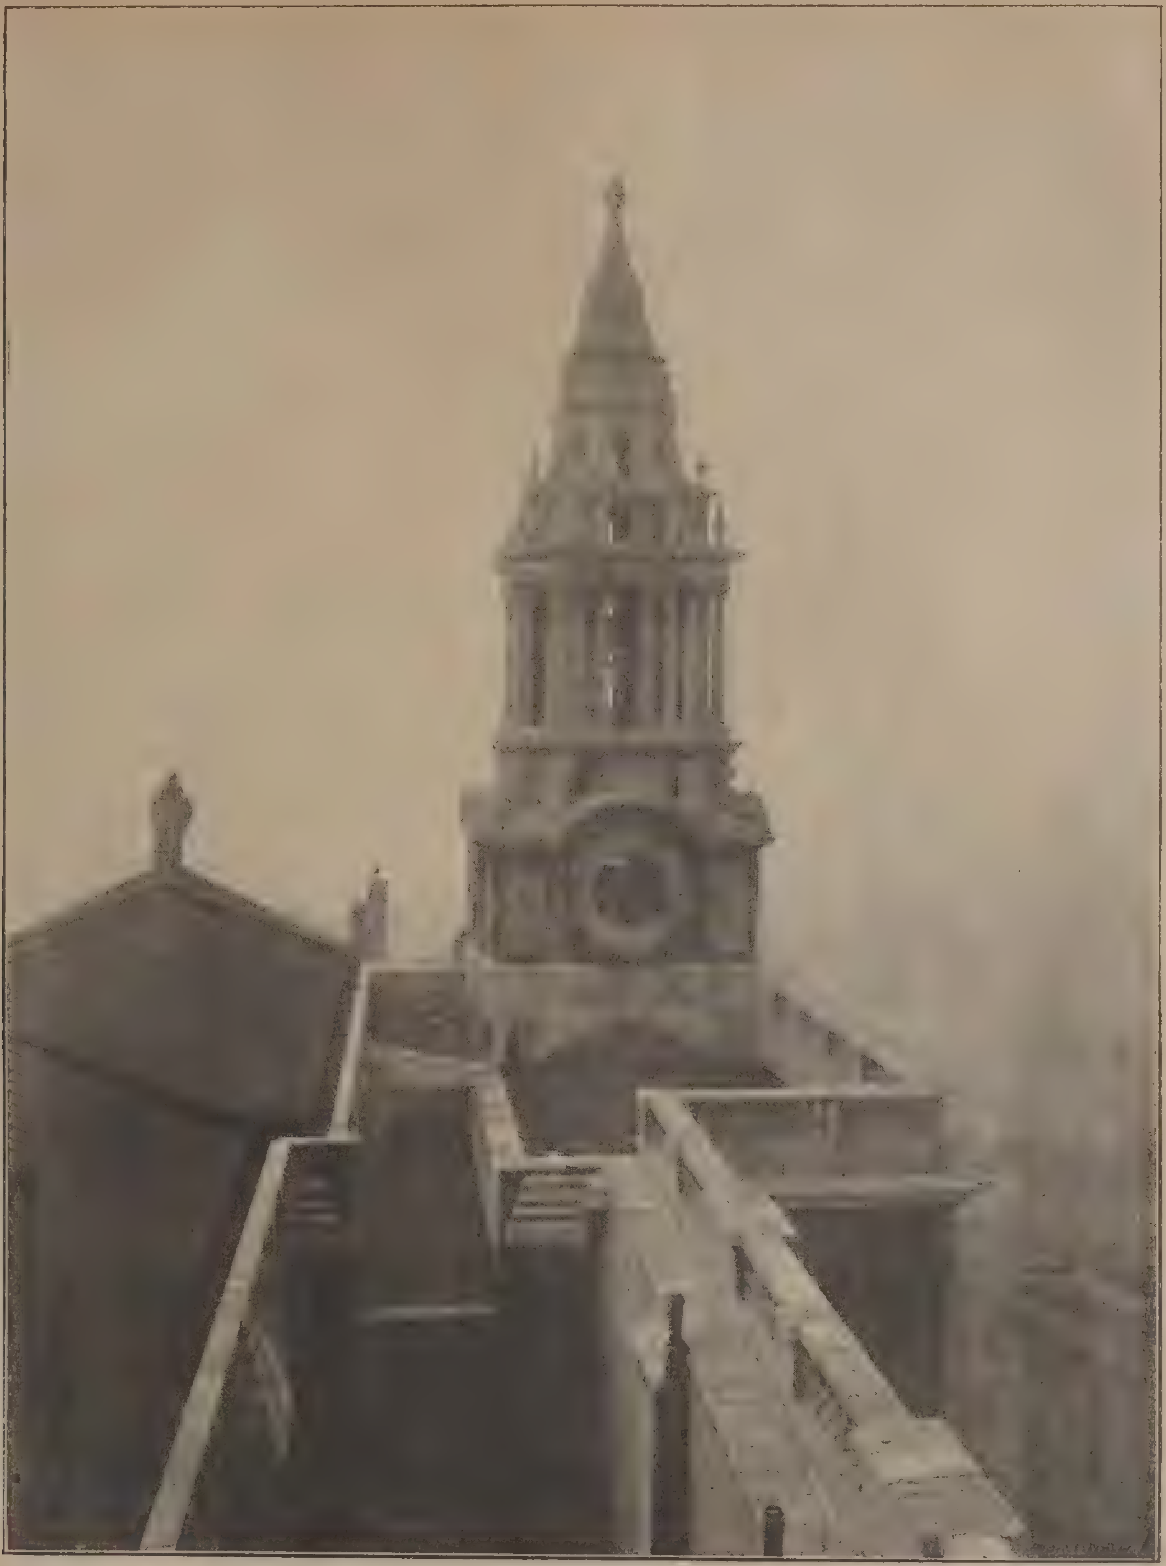
The swelling of the frieze, and, more particularly, the simple yet altogether noble treatment of the windows are also noticeable; and, in fact, the whole building forms a wonderful lesson in proportion and in dignity.

When necessity called for it, Jones was something more than a mere copyist of Italian forms, as is evidenced by his church of St. Paul, Covent Garden, in which most extreme simplicity was demanded, there being no money to expend upon ornament. The result was a building of extraordinary dignity, showing what can be achieved by means of good proportions and honest workmanship alone, but not an example to be strictly followed where there are funds available for something less bare. It displays its poverty boldly and proudly, as if symbolical of manly bearing in adversity.

Wren, less trammelled by tradition, through having seen but little of the Renaissance work of other lands, dared to be more original. His spires alone mark a new epoch, rising, as they frequently do, order above order, in tiers of diminishing size, until a terminal is reached of varying design, all elegant, all commanding admiration, and all illustrative of an entirely new phase of Classical design, and a new application of Classic detail, to give Classic form and Classic feeling, too (not a mere Classic dress), to the essentially Gothic feature of the spire.

The one illustrated is that crowning the north-western tower of St. Paul's Cathedral, and the opportunity has been taken to show at the same time the deep well which exists over the aisle between the wall of the nave and the much-criticised blank wall, carrying the order, and seen from the outside. Unfortunately, the fine main order of the building is in shadow. A point worthy of attention in the lower part of the photograph is the construction of the coping. Another of Wren's great characteristics was the free use which he made of cherubs as architectural ornaments. Appearing in the form of winged heads, vigorously carved, they frequently group round openings in the guise of a company of angels welcoming the worshipper. The idea was—a beautiful one, and, carried out with restraint, as was usual with Wren and his immediate followers, capable of most admirable results; but it was just one of those things which were most easily vulgarised. The tombs in Westminster Abbey are many of them fearful examples of what a depth of degradation in art a cherub's head could typify.

A memorial brass by Messrs. Thomason and Co., of Birmingham, has been placed in Llanthony Church, in memory of the late Rev. Lewis Lewis, for nearly forty years vicar of the parish.



NORTH-WEST TOWER, ST. PAUL'S CATHEDRAL.

SIZE OF GRAINS OF SAND IN CEMENT.

Mr. A. S. COOPER, United States assistant engineer, has recently made a series of tests to compare fine beach sand with the coarser varieties, which have a considerable bearing on the question of the strength of mortar as influenced by the size of the particles of sand used in mixing. During the construction of a mining casemate at Fort Pulaski last year, the question arose as to the advisability of using fine beach sand instead of coarse river sand, on account of the greater cost in obtaining the latter. Mr. Cooper considered that the fine sand would be nearly as good—in fact, good enough—and as its employment was estimated to save at least £200 sterling in the total cost of the work, a short series of experiments was made, which, to the astonishment of all connected with the work, proved the fine sand to be slightly stronger than the coarse. These results were spoken of as being opposed to those obtained by all previous experimenters, and this fact induced the author to investigate the question in a more thorough and scientific manner.

The method of working was so devised as to eliminate as many uncertainties as possible. The sand was first graded by means of thirteen sieves, ranging from 8 to 140 wires to the lineal inch, and the grades indicated by the two sieves used. The grade 8 = 12, for example, means that the sand in this grade passed a sieve with eight wires to the inch, and was held by one with twelve wires. It was concluded to mix the mortar rather dry, about the consistency of moist snow, so as to be able to handle the briquettes immediately after moulding them. It was also believed that a dry mortar would give more even results under uniform pressure than a wet one. The sand and cement were first carefully weighed, then they were mixed dry by means of a square box with a rod run through the corners. The water was measured with a graduated glass, and mixed into the cement and sand on a stone table with a trowel. If the mortar appeared too dry, more water was added; and if too wet, note was made of the fact, and the set proceeded with. In nearly all cases, enough mortar was made at one mixing to make eight briquettes. Four of these were broken at the end of a week, and the remainder in eight weeks. As a difference of 1 per cent. of water in the finished mortar could not in all cases be detected, a series of tests was made to determine the effect of such variations. The results proved conclusively that slight variations in the amount of water might cause considerable differences.

Some cements and some sands of the same size require more water than others to yield a mortar of the same consistency. Generally speaking, fine sand requires more water than coarse, and natural cements more than Portlands. The briquettes were moulded in brass moulds; but were not pressed in by hand. The method used by Prof. Charles D. Jameson was adopted. Professor Jameson put his mortar into the moulds under a uniform pressure of 150lb. per square inch, while in this work 200lb. were used. The press consisted of a simple lever arranged in such a manner that when pressure was applied nothing but vertical pressure would be transmitted to the briquette. Generally speaking, the coarser the sand, the stronger the mortar made from it; but the difference between the grades below 30—40 are so slight that, as far as sizes are concerned, they might be considered in one class. There seemed to be a tendency towards an increase in strength with grades below 100-120; but so few samples of these grades were obtained that this slight increase may be put down as accidental. There is an unmistakable indication of weakness in the upper grade, 8—12. The specific gravities of all of the various kinds and grades of sand tried are not materially different, and therefore the difference found between the weights of equal volumes are principally due to the different percentages of voids. It is further apparent that the smaller the grade the greater the percentage of voids in loose sand, and *vice versâ;* while in well packed sand there is practically no difference in percentage of voids. These results indicate that uniformity of mortar briquettes for tests can be obtained only by either measuring the sand while well packed or by weighing.

The conclusions arrived at were: (1) Other things being equal, coarse sands are better than fine sands for cement mortar up to the grade 12—16, or about $\frac{1}{12}$in. in diameter. (2) Below the grade 40—50, or about $\frac{1}{60}$in. in diameter, there is no practical difference in the value of the different sands, as far as the size is concerned. (3) The shape and condition of the surfaces of the grains of different sands has as much to do with their value for cement mortar as the size.

◆

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of this Association was held on Friday evening, the President, Mr. W. D. Caröe, in the chair. Messrs. W. J. Devlin and A. Hendy were elected as members.

BRICKWORK.

Mr. John Toomey read a paper on this subject, illustrated by a number of samples. The author explained that he proposed to confine himself to the consideration of the materials used by bricklayers, with a few remarks on methods of using them. He had often found that the quality of the sand used for building purposes did not receive the attention it deserved. A clean, sharp sand was essential to the making of good mortar, whether mixed with lime or cement. The many impurities to be found in sand certainly acted injuriously, and tended to detract from the strength of the mortar. The best way to avoid this was to wash the sand; but the expense attaching to this process prevented its general adoption. But the lecturer had used a Medway sand, and one from the neighbourhood of Hatfield, which were both good in quality, being sharp and clean. Where a mortar-mill was used, the clinkers from a dust-destructor mixed in reasonable quantities with sand and lime or cement made a good mortar. But it was always an important point to see that a proper proportion of lime or cement was used, which was not always done. The question of the qualities of bricks was such a large one that he only proposed to speak of a few kinds. The numerous kinds of bricks that were now in the market showed that greater attention was being paid to their production, chiefly in facing bricks for external use. They might be divided into two classes—viz., the "sand" brick and the "pressed" brick. The different processes of manufacture of the two bricks were very different: the sand brick being moulded while the materials were of a dough-like consistency, and the other being pressed while the ingredients were nearly dry; this difference of manufacture tended to make the pressed brick squarer and more regular in shape and size. But a brick, like terracotta, needed to be well burnt to be durable, and in burning it lost in shapeliness what it gained in durability. The author of the paper then referred to and commented upon various specimens of bricks in ordinary use, which were exhibited. In regard to malms, he remarked that they had gone out of use very much as facing bricks, in consequence of the competition of cheaper external facers. The small holes which appeared on them when rubbed were caused by the method of burning, and he thought some means might be devised to avoid this objectionable feature. Shippers, next alluded to, were described as similar to malms, but harder burnt; they were used as the facing to the London Board schools, and were the most durable for that purpose in the market, although the dull colour was objected to by many persons. Stocks were included in the same class, and were somewhat inferior in quality, and, of course, also in price. These three bricks he considered unequalled for durability and cohesion; he had experienced much greater labour in cutting through walls built with them than was found to be the case when cutting through pressed or wire-cut bricks. The red sand brick had the advantage of retaining its warmth of colour and even improving with age; many were apparently soft, but they hardened with age. Red pressed brick had an advantage in uniformity of size, but in exposed situations he had seen the surface peel off under the influence of damp, exposing the rough interior. These bricks had long been the kind chiefly used in the Midlands, and were coming more into fashion in London. The Leicestershire bricks were, he thought, the best of this class, and much better than those from Tunbridge Wells. Comparing the last two classes of brick, the red sand and red pressed, the makers of the latter had recognised the demand for a brick regular in size and with a clean sharp arris, while little effort had been made to improve the former type. The latter, however, had the advantage in colour. The wire-cut brick, though used for cheapness for internal facing, was inferior to the common stock; one great fault was that when cut with the trowel, it had a tendency to fly to pieces all over. The principal point in favour of the Fletton brick was its squareness, and that it could be delivered in London cheaper than a stock brick in many cases. Glazed bricks included many inferior kinds with which it was impossible to do good work, owing to the variation in size, and to make a satisfactory job with even the best quality it was necessary that those laid on each course should be gauged before being laid, or joints of uneven thicknesses would result. Salt-glazed bricks made serviceable work for dados, &c. Their faults were variation of tint and many small blisters on the surface. A second and much worse blistered specimen was exhibited, the lecturer drily observing that the first was the sample submitted by manufacturers or merchants, the second was the kind sent on to the job. It was possible to obtain them with these faults reduced to a minimum, but care should be taken to insure that the external and internal facing-bricks were the same thickness. Passing on to consider the methods of bedding bricks, Mr. Toomey said he thought it was essential (except during the winter months) that bricks should be well wetted before being laid. This was all the more necessary where cement-mortar was used, or the materials would not adhere to each other. The only possible way to secure strong work was to grout each course of brickwork, and this was where the advantage of washed or well-screened sharp sand was seen, as it would more readily fill the open joints of the brickwork. The plastering of mortar on the top of each course would not do. But the fact that wet bricks made bricklayers' fingers sore might have something to do with the frequent neglect of wetting bricks. In work that was to be pointed after the building was erected, the joints should be raked out at least $\frac{1}{2}$in. deep, and well brushed off with a hard broom, so as to clear away all loose mortar, and the pointing should be well pressed or ironed into the joints. In glazed or enamelled work it might be often noticed that after a time the glaze flaked off, and the defective part appeared black. This was very often due to using chipped or defective bricks, but it also sometimes resulted from another cause—viz., the mode of bedding them. The bricks had two deep frogs, and generally being laid in a close joint, care was not always taken that sufficient mortar was spread to insure the frogs of the brick being solidly filled, so that when the weight came on the wall the pressure was largely on the outer edge of the brick, and caused the glaze to fly. One way to obviate this was to fill the frogs with mortar before laying the bricks. Another way was to joggle either the end or side of the brick before bedding, and to fill or grout them up with liquid mortar. In concluding his short but practical paper, the lecturer remarked that the conditions of the present-day building often compelled builders and others to carry on their works in sections. Very often party-walls were built with a vertical toothing, and when the second building was added there was no proper bond between the two, and when the later work settled the toothings were broken off. If the delay in building could not be avoided, the toothing had better be omitted. He thought the connection of making good to such toothing should be done with cement.

Mr. W. Howard Seth-Smith proposed a vote of thanks to the lecturer for his eminently practical and useful and, indeed, exhaustive paper, in which he had dealt both with broad principles and details. The suggestion that toothings should be filled up with cement was one which ought to be generally adopted.

Mr. Francis G. F. Hooper, in seconding the vote, said that experience had taught him that scamped work was not usually the fault of the bricklayer—there were other unseen influences at work. He was a member of a committee of the Institute of Architects, who were carrying out a series of practical experiments at the West India Docks in the testing of brickwork. A series of piers built four months ago were now being tested, and it was proposed to carry out a second series on other piers eight months hence, when ample time would have been allowed for settlement.

Mr. F. T. W. Goldsmith asked as to the custom of the craft in building a 9in. wall.

Mr. B. Flight Fletcher urged that it was as necessary to wet bricks in winter as in summer, for if laid dry the mortar would not adhere to them. He asked as to the relative value of mill-made and hand-made mortar. The latter was a better colour, but in the former broken bricks could be ground up, and this made the substance, according to many practical men, stronger. In Tudor brickwork the joints were very wide, whereas in that of Queen Anne's time they were as close as possible, and modern architects generally followed the latter practice. Most engineers objected to toothing new work into old, and preferred to let each building settle its own way.

Mr. F. Walker, as a practical man, thought mill-made mortar had its advantages and defects. It was true that the ingredients were thoroughly incorporated in a mill, but there was the risk that they would be overground, so that they became mere dust, and the mortar had no cohesive strength. It was very usual to see in specifications that no more mortar should be made than could be used during the day; but this was altogether wrong. So long as the mortar was not allowed to get dry, the more often it was tempered and retempered, the stronger would be the work. He did not think sand-faced bricks were so much to be condemned. If well burnt, they were frequently more durable than pressed bricks. The latter were often deteriorated by the machine-oil used in oiling the moulds. He should not use malms for external work, as they were absorbent, and therefore soon became dirty. He endorsed the lecturer's remarks that shippers were about the best brick for use in London. In shippers one got a variety of colour which was more pleasing than the dull, dead yellow tone possessed by a malm brick front. His experience of all bricks was emphatically that it was most difficult to get bricks delivered on the works equal to sample. To secure a thoroughly good durable red brick one should seek for a dark colour, with great density and weight. Leicestershire yielded very good red bricks, and, in fact the clays over the whole of the coal-measures gave very good bricks; but in Staffordsire the materials became more refractory, and produced the well-known firebricks. All sand bricks, and especially those from the Fareham district, improved with time; in fact, he thought no better bricks for colour could be had than the Farehams. The only good point about wire-cut bricks was the readiness with which they took mortar. The Fletton bricks were very friable. In glazed bricks sufficient joint was frequently not allowed for bedding, so that good solid work could not be turned out. At the very least $\frac{3}{16}$th of an inch should be allowed for bedding glazed bricks. A very grave objection to this class of goods was its susceptibility to craze. The salt-glazed brick was not, as many architects seemed to suppose, a dipped brick, but was treated by salt thrown into the kiln during firing. The faint blur often seen on bricks was due to insufficient space being left between the bricks while in the kiln. It was very dangerous to wet stocks during frosty weather; but it was certainly needed in the summer, as the surfaces of the bricks were coated with dust, which prevented the adhesion of the mortar. In the United States bricklayers never thought of flushing up or wetting brickwork during the winter, the frosts being much more severe than in this country. They carried out their work with heated bricks and heated mortar. There was no question that struck brickwork was far better than pointed work. Every practical man realised the evils and risks of toothing old work to new, and where possible it should be avoided on account of the unequal settlement. Mill-made mortar was fatter and more plastic, but for external work hand-made mortar was preferable.

Mr. Owen Fleming preferred mill-made mortar to hand made, except that the colour was not pleasant. The architect for the sake of uniformity was tempted to ignore theory, and specify that his brickwork should be pointed, and not struck, on account of the improved appearance. Fletton bricks had their use, but not for exterior work in London. Just now, owing to the fluctuations of the market, red facings were a little cheaper than stocks if a good class was specified.

Mr. H. H. Statham preferred the appearance of wide mortar joints to narrow ones.

Alderman H. R. Taylor, L.C.C., referred to the fact that architects often specified the openings and piers of sizes which could not be carried out in brickwork, except with an unnecessary amount of broken bond. Struck brickwork, as done everywhere till within the last quarter of a century, was far preferable, and stood better than the pointed work now universal; and in his early days, when working with his father, he always struck his brickwork as he went along. It was said that struck work could not now be done; but if it were specified, the demand for good work would soon produce a supply. As to building a 9in. wall, bricks were not, as a rule, quite true on all faces, and therefore a good wide joint should be made, and the bricks humoured in laying so as to get a level surface. Milled mortar was not, he had found, so pleasant to use as hand-made, and some of it seemed to have been sifted through a ladder, it was so coarse. It was very good material, however, so long as it was not ground too finely, and no mould was allowed to be thrown into the mill. He was glad to see architects and artisans in friendly conference, and if some members of the profession would come down to a meeting of the trade, he could promise them a lively time. If architects would draw up intelligible and practical specifications, plenty of men could be had to carry out the works satisfactorily.

Mr. E. Woodthorpe said there was a prejudice against hollow walls; but in bricks made in sandy districts, walls could not be built to keep the weather out unless they were hollow, or slated. The most frequent fault was carelessness as to placing the ties in hollow walls.

The President, in putting the vote of thanks, said his advice to young architects would be to avoid the use of the mortar-mill as far as possible, for its evils outweighed its advantages, the chief being the risk of over-grinding. One of the greatest evils of the bricklaying trade in the present day was that bricklayers knew the work would be pointed down by another man, and so did not trouble to execute the work so well as when they had to strike it down as they went along. The only difficulty—and that, he admitted, was a great one—was the occurrence of frost while work was being struck. In Scandinavia the practice during severe weather was to mix with the mortar some unslaked lime. As it slaked it evolved such heat as to protect the brickwork. He had tried to adopt the practice on many occasions, but had failed to get men to do it successfully in this country. He believed in wide joints and small bricks, for with small bricks the scale of the building was increased, and the pattern of the brickwork bond was not observable. With the large bricks used in Manchester and Liverpool the effect of the pattern of the courses was very obtrusive, and the work looked coarse. If Flettons were used for internal wall, the joints should be kept well back, as their surfaces were exceedingly difficult to plaster upon.

The vote of thanks having been passed by acclammation, Mr. Toomey replied. He admitted that it was possible to grind mortar in mills too much, but the usual error of builders was in the other direction. If the ingredients were good, mill-made mortar was excellent. The common item in specifications that only as much mortar should be made as could be worked up in the day should only apply to hydraulic mortars—in other cases it was quite needless. Care should be taken in using blue lias lime mortar, as it often fractured off the arrises and corners of the bricks. There were no better bricks than Fareham reds, but they were expensive in the labour of cutting. The common faults in hollow-built walls were, first, that no provision was made by leaving out a few courses at the bottom of work for raking out any mortar that fell down between the walls, and next that the ties were not V-shaped, nor put in level. As the President had said, Fletton bricks would not take mortar well, and therefore the joints should be thoroughly raked out. There was no greater evil in the craft than the subdivision of trades, and one of the worst was that work was so generally pointed instead of being struck. If the latter course were adopted the work would be sounder, look better, and last far longer.

NOTES ON APPROXIMATE ESTIMATES.*

CIVIL BUILDINGS, WORKS, &c.—(*Continued.*)

	Average Cost.		
	Per foot cube.	Per square of 100ft. super.	Per unit.
288. Walls, Stone, Extra only to. For each chimney-flue, including digging, concrete footings, lead flashings, ashlar stone chimney-stack, &c., but exclusive of chimneypiece, grate, or kitchener	—	—	£10 each
289. Walls, Stone, Extra only to. For each bay window, including digging, concrete footings, roof, lead flashings, sashes, frames, and finishings of ordinary description	—	—	£16 each
290. Warehouses. Iron. For canal, docks, or railway goods. Comprising iron columns and roof trusses, corrugated-iron covering to roof and walls, with timber framing to walls. Concrete floors. Height 14ft. to eaves	2½d.	£24 0 0	—
291. Warehouses. Plain	6d.	—	—
292. Warming, by means of hot-water pipes and coils. Houses or mansions	—	—	£4 per 1,000 cubic feet
293. Warming. Ditto, ditto. Churches	—	—	£1 per 1,000 cubic feet
294. Warming. Ditto, ditto. Factories	—	—	£2 per 1,000 cubic feet
295. Warming. Ditto, ditto. Hospitals	—	—	£3 per 1,000 cubic feet
296. Washhouse. (See "Laundry")	—	—	—
297. Water-Closets. As for private houses, complete with soil and ventilating-pipe, pan, mahogany seat, water-waste preventer, &c., but exclusive of water supply	—	—	£18 each
298. Water Mains, laid complete, including coating with Dr. A. Smith's process, lead joints, digging, filling, &c., in common ground, clay, or gravel. The trenches to be deep enough to allow tops of pipes to be 2ft. below surface of ground. (See Table)	—	—	—

Analytical Table of Average Cost of Cast-Iron Water-Mains per Yard Run, laid Complete.

Diameter of main.	Cost of mains, including bends.	Cost of lead for joints.	Cost of laying and jointing mains, including digging, cartage, &c.	Total cost per yard run.
Inches.	s. d.	s. d.	s. d.	s. d.
2	1 9	0 1½	0 11½	2 10

THE MANCHESTER BUILDING TRADES EXHIBITION.

THE Manchester Building Trades Exhibition, which is to be held in St. James's Hall, Manchester, in April and May next, promises to be a great success. Mr. Albert P. Baker, of 57, Deansgate, Manchester, is the general manager, and he is organising matters thoroughly well.

In order to help exhibitors in showing off their class of goods to the very best advantage with effect, at the least possible expense, the management have decided to call in the assistance of one of the leading firms of architects in Manchester, Messrs. Darbyshire and Smith, who, after receiving particulars of class of goods to be shown, will supply a plan under special terms giving the desired effect so much needed to catch the eye of the Press, the architect, the builder, and the general public. The utility and effect of many excellent inventions are overlooked for want of display. It will serve for other exhibitions, and wood blocks will be made and supplied to the various building trades publications before the opening of the exhibition. This in itself would more than compensate for the little expense attached to same. Full particulars may be had on application to the general manager.

The exhibits will include construction, engineering and machinery, decoration, kitchen appliances, workshops, plumbers' work, mining and mining appliances, furniture, smoke abatement, electricity, paints and colours, sanitation and ventilation, fuel, gas, &c. The *locale* of the exhibition is a most eligible one, and it may be confidently expected that the public of the Midlands will visit it in considerable numbers. We shall give fuller particulars shortly, and meanwhile advise exhibitors to book space early.

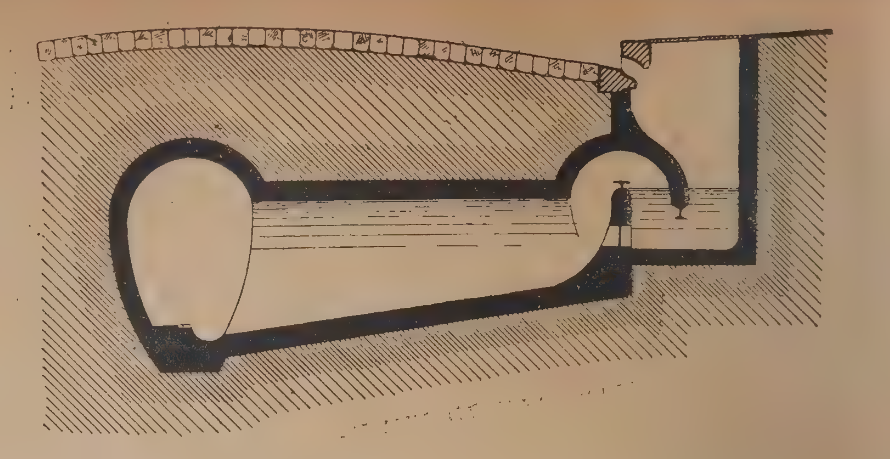
SIPHONED BRANCHES FOR STREET GULLIES.

AN interesting report was made at a recent meeting of the Society of Sanitary Engineers and Architects of France, concerning a new system of siphoned gully branch proposed by M. Freret, secretary of the Paris syndicate of paving and drainage. This system, which will in all probability be employed to a large extent at Paris, is worthy of report for the consideration of English sanitary engineers. It is intended to prevent the return of noxious gases from gullies connected with the sewers, and is especially useful for those situated near the large markets and slaughter-houses, and also places such as omnibus stations, where the public are obliged to remain for a certain length of time.

It is a certain and disagreeable fact that Paris, during certain hours of the day, and more especially at evening time and during the warm weather, is infected with evil odours, the cause of which is still a matter for discussion. According to M. Bechmann, chief sanitary engineer of Paris, the causes may be numbered at four. The smells from the works outside the city, classed as unhealthy establishments; the carrying through the town of residues from butchers' shops, slaughter-houses, and dairies; the chimney-stacks of various manufactories; and the Bondy night-soil depot. The remedy would be the disinfection of the residues by means of chloride of zinc, the improvement of the apparatus destined to destroy the disagreeable properties of emanations from unwholesome manufactories and work-stacks, and the suppression of the Bondy depot. According to M. Besançon, chief inspector of unwholesome manufactories, the drains are the chief causes of the unwholesome odours; and M. Freret ranges his opinion with that of M. Besançon. The water-supply of Paris is absolutely insufficient for the needs of the population; the more so that now the excellent system of the "tout à l'egout" drainage is being installed in all the new houses built at Paris (the system becoming obligatory for all dwellings at the end of three years from now), a large quantity of soil and matter is sent into the sewers, and for the proper dilution and expulsion of the drain matter a considerable supply of water is necessary. In spite of flushing reservoirs in dwellings and sewers, it is certain that the drains and sewers are not sufficiently water-swept, especially during the hot weather, when the periodical flushing should be much more frequent. The drains, however, should not be cleansed with water, which, even for drinking purposes and toilet necessities, is in too small a supply; still something should be devised to counteract as far as possible, the inconveniences arising from lack of sufficient water; for it must be remembered that the present exigencies are at a minimum: they will increase day by day in considerable proportions.



A certain number of siphoned gullies already exist in some of the private streets. In these cases the siphon is formed by the kerbstone and gutter, but as the water trap is thus perfectly open to the air, a slight frost only is necessary to stop its proper working; again, in the case of the siphon basket gulley the same objections holds good. In the opinion of M. Freret the siphon, if any, should not be arranged at the gully mouth, but in the lower branch connection with the sewers. Besides the siphon arrangement, which he opines is most necessary for gullies in much crowded streets, he proposes to adopt therewith a trap for reception of all refuse carried into the gullies from the streets, this trap being more convenient than the system of basket trap, and specially suitable in places near markets, &c., where a quantity of waste and refuse is thrown aside on the roadway, and carried by the first rainfall into the gullies. He has himself employed a somewhat similar system in a scheme of drainage for a street containing metal founders' works and modelling workshops. In this special case the fall of the existing sewers being very slight and the amount of heavy sand from the founders' and modellers' workshops carried into the sewers being very considerable, the complete obstruction of the sewers, and therefore continual flooding of the streets was a speedy matter. As it was not possible to give a greater fall to the new sewers it was necessary to devise a new system which would obviate a return to the old state of affairs, the result being an arrangement of traps to receive and hold all sand and mud entering the sewers by the connecting drains, and a system of siphons preventing the return of foul odours. An improvement on this idea is what M. Freret proposes for the Paris streets for at least during the time that the supply of water is not sufficient for proper flushing purposes. It consists of a branch connecting gully similar to those now existing, differing only by the well and its cover being placed beneath the pavement on the inner side of the kerb. Exactly under the gully mouth and crossing the gully, a small wall is built, the height of which would vary according to the necessities and the desired level of the water-trap. Over this wall, and parallel to it, is built a small semicircular vault, one end being supported by the masonry of the gully, the other end resting on an iron bar placed below the level of the water trap. The height of the water-trap, and the strength of the iron rail should, of course, be calculated according to circumstances and necessities. An iron sluice placed in the cross wall would permit the periodical cleansing of the gully cess-pit from the sewer end, and the carrying away of the accumulated refuse. The siphon would act as a periodical flush, and at the same time prevent all return of foul gases from the sewers. The siphon may be applied at very little cost to existing gullies, and in new constructions the extra cost would only be that of a few extra feet of masonry, a little extra cement, and an iron rail.

A single objection, and one which is not without value, may be made to this system of siphon. This is the suppression of the ventilation of the sewers. But, as M. Freret says, the question of ventilating the sewers by means of the gullies is a much-discussed matter—in any case, the remark may be made that the effect of such ventilation is lost at 300ft. from the outset, owing to the connecting drains.

In putting his idea before the meeting, he urged its adoption, if not in all cases on account of the supposed danger of loss of ventilation, at least in the cases above mentioned, where much refuse carried or thrown into the gullies remaining there for a certain length of time, and becoming putrefied, is a great source of danger to the public health.

It would be interesting to know the opinion of English sanitary engineers concerning this system of siphoned gully branches.

Arthur Vye Parminter.

SOME CONDITIONS OF CONTRACTS.

THE second of a series of monthly meetings of the Glasgow Building Trades Exchange was held on Thursday in last week, when Mr. Robert Scott, measurer, Glasgow, delivered a paper on "Some Conditions of Contracts." Colonel Bennett presided. Mr. Scott said the conditions he proposed to deal with were those relating to the extent and character of the work in the contract, the variations, the extras, and the appointment of arbiter. The extent and character of the work was usually determined by the plans and estimate, and it was necessary that plans should be carefully prepared, so as to give a true indication of the nature and extent of the work to be contracted for. The detailed drawings furnished during the progress of the works should only be developments of the original plans. The estimate should contain an accurate representation of the nature, quality, and measurement of the material and labour, each part being measured on a well-defined principle. In some cases such complete plans were not forthcoming, consequently proper estimates were not supplied, and when the work came to be executed details were found to have little or no relation to the original drawings, and disputes arose as to the prices for altered work. Mr. Scott proceeded to deal with the clause empowering architects to make alterations. He quoted the usual clause, commented on its elasticity, and advocated that the powers it contained should be as little taken advantage of as possible, so that the contractors might only be called upon to execute work truly contracted for. In dealing with extras, Mr. Scott pointed out that many items arose where contract rates did not apply, and that these should be priced at fair and reasonable rates. With regard to the question of appointing an arbiter, he said that in ordinary contracts it seemed to be the custom for the architect to appoint himself to the post. As the architect was really agent for the proprietor, this was naturally objected to by the contractor. He stated that the general opinion was that in all cases the abiter should be some properly qualified person mutually chosen, and in the event of parties failing to agree on an arbiter, the arbiter should be appointed by the sheriff of the county. A discussion followed, in which Mr. Goldie, Mr. Howatt, Mr. Young, Mr. Muirhead, Mr. M'Gilvray, Mr. M'Culloch, and Mr. Murdoch took part.

The demolition of the old East Pile Pier at the entrance to Calais Harbour, and the excavations necessitated thereby, have led to the unearthing of several interesting relics. Amongst the most interesting are part of the hull of an old man-of-war, and a bronze cannon 9ft. in length.

ILLUSTRATIONS.

MILAN CATHEDRAL.—THIRD PREMIATED AND OTHER DESIGNS FOR THE PROPOSED SHOREDITCH FREE LIBRARY.—DESIGN FOR A CABINET.—A CAST BRONZE LOCK.—NEW PREMISES, BRIGGATE, LEEDS.—NEW HOUSE ON HIND HEAD.

Our Illustrations.

MILAN CATHEDRAL.

The Duomo at Milan, one of the architectural wonders of the world for vastness of size and its ornate elaboration, needs no special descriptive account on this occasion, particularly as we have in more than one instance, when giving other illustrations of the church, accompanied our plates with such particulars. Owing to the darkness of the nave inside, it has hitherto been impossible to obtain satisfactory photographs of the cathedral, and the best views from the camera have been more or less impaired by the effect of halation from the great lantern surmounting the crossing. Our present illustration, therefore, is of special interest. When its author, Mr. J. T. Sandell, applied to the authorities for permission to photograph the interior, he was told that he might try what he could do; but the official pointed out the uselessness of the attempt, as so many had tried—only to fail. Mr. Sandell's plates, however, proved equal to the occasion, with the result that even the tie-bars of the roofing vaults intervening between the camera and the windows are registered without any halation whatever. Moreover, the lights on the altar are clearly defined in the photograph, which is a marvel of definition, while the stereoscopic effect in the silver print is uncommonly well rendered, an advantage largely due to the atmosphere being so clear. In reproduction, it is, of course, beyond the limitations of photo-lithography to adequately represent such delicate excellences; but they are certainly worthy of comment, and we have to add, that in the original photograph all the painted tracery decorations in the spandrels of the vaulting are shown with perfect clearness. We have not hitherto given a general view of the nave of Milan Cathedral, but a drawing showing a cross view inside the building will be found in our issue for July 16, 1886, and on May 7 and 21 of the same year elevations and plans were given. The nave of Milan is 160ft. high by about 55ft. wide. The selected design for the new west front appeared in the Building News for December 21, 1888, from the drawings of the chosen architect, Sig. Giuseppe Brentano, whose unfortunate and early death has caused considerable delay in the execution of his work. Mr. Daniel Brade's design for the same façade figured in our pages for Nov. 16, 1888. The famous flying buttresses, forming the richest part of this world-famed duomo, were illustrated by us on March 30, 1888.

SHOREDITCH PUBLIC BATHS AND LIBRARY.

There is little to add to what has already been said in our pages concerning the third premiated design, by Messrs. Groll and Todd, for these buildings. In a general way, the arrangement of its main parts for the baths department, follows somewhat the lines adopted in the plan awarded the first place, which we illustrated the week before last, the second prize plan being given by us on the 20th inst. We now print the view and plans of this third-placed design. It will be seen that it has in the library building, the initial and very important defect of having the lending library located on the first-floor. The porter's box is too exclusively restricted to the control of the boys' room, with not sufficiently direct supervision to the news-room, magazine-room, or staircase; whereas this official should be able at a glance from his "coigne of vantage," to obtain a view throughout the entire public part of the ground-floor. Accompanying the above illustration, we print copies of the two designs marked No. 2, and No. 31, the first sent in by Mr. Francis J. Smith, F.R.I.B.A., an experienced public bath specialist, and the second-named plan submitted by Messrs. Spalding and Cross, who are also well-known for this class of work. Of these two designs, Mr. A. Hessell Tiltman, the author of the second premiated design, in writing to us last week, made the following pertinent remark: "I think I cannot conclude without drawing attention to the several very excellent sets of designs submitted by my rivals, notably, amongst others, No. 2 and No. 31, and it is a very strange thing that some of these plans did not receive two of the premiums. Of course, I speak of baths; I have no claim to criticise library plans." In No. 2, all the bath accommodation is contrived on one floor, and direct emergency exits are provided from the side of the big hall into the street, with an open-air gallery staircase at one end, and another also immediately leading into Bowling Green-walk at the other. The washhouses, as in the second prize design, are entered from Coronet-street. In No. 31, the hall is placed end on to Coronet-street, with emergency exits towards that thoroughfare, and the waiting halls for men and women are so contrived, as to answer as crush-rooms. Several of the competitors treated the Bowling Green-walk elevations too architecturally, for it is merely a passage less than 10ft. wide, and thus the façades could never be seen. The vestry meeting to consider the referee's report is expected to be held on New Year's Eve.

A CABINET—NATIONAL BRONZE MEDAL DESIGN.

There is not much to add to the copious information so fully furnished by Mr. F. W. C. Gregory's detail drawing, which we are enabled to reproduce to-day, in illustration of his prize design for an oak cabinet for books and china. The plans and elevations are further elucidated by a clearly-drawn perspective sketch, and added to these are portions of the work set out to a larger scale, such as details of the bronze candlestick terminals, and drop handles to the doors. We are indebted to the South Kensington authorities for the loan of the original drawings, which, with the author's consent, were sent us from the recent exhibition of students' work held in the Museum annex, at Brompton.

A CAST BRONZE LOCK—NATIONAL BRONZE MEDAL DESIGN.

The admirable character of this capital design distinctly places it above the level of mere cleverness, for its leading idea is monumental, without being overpowering in scale, and it is unhesitatingly refined, at the same time avoiding any claim to prettiness as a prime consideration. The limitations of the moulder's art, too, are properly observed, and there is nothing in the detail which does not recognise that the work is to be produced by casting. A further merit in the design also is its departure from rigid architectural lines, as in the pediment, which is handled in a sculptor's manner as a decorative accessory rather than a diminutive model of a building's vast façade. The plain reserve of the unornamented pavisors adds considerable breadth to the composition, while the armed figures seem to indicate janitors ready to defend the entry. Mr. Leon V. Solon, of Stoke-on-Trent, is the author of this prize work.

RECONSTRUCTION OF SHOP PREMISES, NOS. LXIX. AND LXX. BRIGGATE, LEEDS.

This work, consisting of the conversion of two shops into one, is now well in course of erection, and is situated in one of the best positions in Briggate. The reconstruction entailed the pulling down and rebuilding of the front elevation, raising the floors and roof, and considerably enlarging and deepening the cellar. The contractors are greatly handicapped owing to the proprietor carrying on his business in the back portion of his present shop, which is the lower one on the passage side, and therefore the work is being carried on in two sections. The front section is to be entirely completed first, when the business will be transferred to this portion, and the back section will then be gone on with. The shop, besides the front and back windows, is to be lighted by means of skylights on the roof, and open wells on the first and second floors. The ashlar in the front is from the Rose Hill Quarries, Shipley, the shop front is treated in Spanish mahogany, and the roof is to be covered with green Westmoreland slates from the Coniston Quarries. Messrs. Craven and Umpleby, of Leeds, are the contractors for the whole of the work, exclusive of the shop front, which is a separate contract let to Mr. Horsman, shopfitter, of Leeds. The work is being carried out from the designs of Mr. Henry Buckley, architect, 5, Park-lane, Leeds.

NEW HOUSE ON HIND HEAD.

This house, with its stables, has been built on the property of Mr. A. W. Williamson, F.R.S., at Hind Head. A compact arrangement of plan has been aimed at, so as to produce a warm interior. The walls of the lower story are built with two facings of brickwork, having the space between filled in with fine cement concrete. The upper story is tile-hung, and the roof is covered with Broseley tiles. Our illustration is from a drawing prepared by the architect, Mr. Arnold S. Tayler; but the design has been somewhat modified in execution.

CHIPS.

Canada sells more lumber to the United States than to Great Britain. Thus the Canadian exports of forest products in 1894 to the United States aggregated in value 13,903,586dol.; to Great Britain, 12,332,726dol.; and to other countries, 1,937,491dol. Grand total of Canadian exports of forest products in 1894, 28,173,813.

A stained-glass window has been erected in Duns Parish Church, in memory of the late Sir Samuel and Lady Home Stirling. The subjects are "Ruth cleaving to Naomi" (Ruth i. 16), and Dorcas, who "was full of good works" (Acts i. 36).

The Bishop of Peterborough, on Thursday afternoon in last week, opened a new church in Leicester, which is dedicated to the patron saint of the shoemakers, St. Crispin. It is in one of the lowest quarters of the borough.

A concession for the construction of a road to join Baghdad with Teheran has just been granted by the Sultan of Persia to Mr. Felix Moral, the representative of a number of German houses. The road will probably become the principal trade route between Persia and the West. The concession is for 75 years, and concedes the right of constructing the road, levying tolls on it, and working a transport service. The work must be completed in 2½ years. Mr. Felix Moral also obtained a concession for the construction and working of a steam or electric tram from Teheran to the villages north of the city, a distance of ten miles. The construction of the cart-road from Resht to Kazvin has been begun.

The Tower Subway Company (who secured themselves by a clause in the Tower Bridge Bill) find their tolls so injuriously affected by the new bridge of the Corporation that they have presented a claim for £30,000. It goes to arbitration immediately.

A memorial window has just been erected in the parish church of Crieff in memory of the late Rev. John Cunningham, D.D., LL.D., who was minister of the church from 1845 till 1887, and afterwards the Principal of St. Mary's College, St. Andrew's. The window is placed at the east end of the church, and the subject is the scene in the Temple where Christ is seen disputing with the Jewish doctors and others. The window is the work of Messrs. Camm and Co., Birmingham.

St. Giles's Church, Shrewsbury, was reopened last week after restoration and enlargement. The alterations consist of the removal of the organ from the north transept and placing of new seats therein to accommodate 50 persons, the removal of the screen between the north aisle and transept, the removal of a stained-glass window representing the Annunciation, the Adoration of the Magi, and the Presentation, from the south wall of the chancel to the north wall of the transept. The window formerly in the east wall of the transept is now located in the south wall of the new organ chamber. Another improvement is the addition of new clergy and choir vestries, and the heating apparatus has been readjusted. These works have been carried out by Mr. J. Bowdler, according to plans by Mr. A. E. Lloyd Oswell, architect, Shrewsbury. The south side has been laid with wood block flooring, a work intrusted to Mr. George Bullock. The organ also has been enlarged.

New House on Hind Head

Arnold S. Tayler, Architect.

Building Intelligence.

Capel Als.—The old chapel at Capel Als, near Llanelly, has been pulled down, and reconstructed at an expenditure of £4,500. An organ loft, with vestries and lavatories, and external wings for the galleries' stairs, have been added, while the schoolroom has also been altered. The style adopted in the renovation is Classical. The inside joinery work throughout is of pitch-pine, while all the pews have mahogany heads. The gallery front is panelled with curled pitch-pine and carved oak, used alternately. The organ front has been designed by the architects, the panels being carved to represent the harp, the bells, the horn, and the cymbals. The rostrum is of pitch-pine, with oak panellings set in mahogany. Messrs. Brown, Thomas, and John executed the joinery work; Messrs. J. F. Jones and Son, Cowell-street, carried out the decorations, including the new ceiling of fibrous plaster: the ventilators being supplied by Messrs. E. Shorland and Brother, Manchester. The windows in the organ-loft have been fitted with lead lights having musical designs. All the masonry and the plastering was carried out by Mr. David Hopkins and Mr. W. Edwards. The clerk of the works was Mr. W. Edwards. The contract was carried out under the supervision and direction of the architects, Messrs. Owen Morris, Roberts, and Son, of Portmadoc.

Dudley.—Various additions and improvements are about to be carried out at the Guest Hospital. The works will include a new operating-room for women, and two small detached wards for special cases; the extension of the women's ward to hold 31 beds instead of 23, as at present; the rearrangement of the kitchen, and children's ward over; the enlargement of the laundry and improvement of the hot-water supply; and extra sleeping accommodation for nurses and servants. The estimated cost of the structural work is about £2,000, besides fitting and furnishing. Mr. William Henman, architect, Birmingham, is preparing plans, and it is hoped the work will be commenced early next year.

Edinburgh.—The plans for the construction of the new Union Club have now been finally approved. The premises are those formerly occupied as the Albert Hotel in Hanover-street, with two shops on the ground floor. The main features of the present front will be retained, and the new work, will be practically an insertion within the lines of the existing pilasters and entablature of the ground story. The style of this front, and also of the internal finishings, will be a free treatment of Italian Renaissance. From the hall access is obtained to the dining-room, 34ft. by 23ft., and to the smoking-room, an L-shaped room, 34ft. by 16ft. The rooms on the first floor include the reading-room, 34ft. by 18ft., billiard-room. Adjoining the billiard-room will be a small private dining-room, a card-room, a committee-room, and the secretary's room. On the second floor will also be members' bedrooms and bathroom. The building will be entirely lighted by electricity. The total cost is expected to be over £3,000. The architects are Messrs. Dunn and Findlay, 94, George-street, Edinburgh.

Glasgow.—The Corn Exchange, which has been under process of reconstruction since early in the year, is now all but completed. It has been constructed of red sandstone from Locharbriggs Quarries. The frontage to Hope-street and return to Waterloo-street, is four stories in height, yet in effect only looks two. The Hope-street frontage is divided into five divisions by engaged columns, the columns being two orders in height. The central doorway has columns in advance of the plane wall, and lead to the Exchange proper, as also to the upper stories by a staircase 14ft. wide. Surmounting the columns of the door are colossal figures—the only sculpture connected with the building — representing Sowing and Reaping, from the studio of Mr. James Young, sculptor. The lower order is Tuscan, and the upper order is Roman Doric. An entablature of architrave, frieze, and corona surmount the three-quarter columns, the triglyphs and blocks being left out. The Waterloo-street portion of the building is of the same character, but it is of one order of height only. The erection of the buildings has been carried through by Messrs. P. and W. Anderson, Glasgow, and Mr. William F. MacGibbon, of the same city, is the architect. We illustrated the building in our issue of August 2nd last.

Landscove.—The church of St. Matthew at Landscove, in the parish of Staverton, was built in 1851 at a cost of £3,000. It is of Early Decorated character, and has a unique interest in that it was the first church ever built from the designs of Mr. John L. Pearson, R.A. Messrs. Jackson, then large builders in Exeter, were the contractors who carried out the work. It was intended at the time that a carved oak reredos, to Mr. Pearson's design, should be put up; but unforeseen circumstances prevented until now, when by the gift a parishioner it has been added to the furnishings of the church. It is entirely constructed of English oak. There is a retable, and above it a super-altar, and the reredos itself consists of three compartments, the central one gabled. The buttresses on either flank project out the full width of the super-altar, thus making returns, and from the outside faces of these are fixed metal movable brackets, to carry the dossals. Running the whole length of the reredos and up the line of the gable is a pierced and carved cresting, whilst at the apex of the gable is the figure of a dove, with outstretched wings, carved in the round. The triplet of panels, although now quite plain, will ultimately be filled with sculptured figures. The reredos is the work of Messrs. Harry Hems and Sons, of Longbrook-street, Exeter.

Lavender-hill, S.W.—The plans for the new Shakespeare Theatre at Lavender-hill, Clapham-junction, have now received the approval of the London County Council and the Battersea vestry authorities. Mr. W. G. R. Sprague is the architect, and the outlay will be about £25,000. The main frontage of 60ft. to Lavender-hill will be of a Classic character, and will be in stone with a projecting portico and balcony. The theatre will be a two-tier house, with stalls and pit on the ground floor tier, dress-circle and balcony on the first tier, gallery and amphitheatre on the second tier, and the usual private boxes. The approaches for the stalls, dress-circle, balcony, and private boxes will be from Lavender-hill. There will be vestibule and crush-room, and the decorations of the auditorium, vestibule, crush-room, and lounge will be Moorish in style. The electric light will be supplied from the proprietor's own plant. The stage will have a clear width of 70ft. and a depth of 50ft., and a height of 56ft. to the grid. The dressing-rooms will be provided with hot and cold water supplies, and be heated, and will stand as a separate block cut off by brick walls and iron doors from the stage. A complete system of low-pressure hot-water pipes and radiators will be provided throughout the building; and the stage and auditorium will be separated by a fire-proof curtain. The theatre will be opened next August Bank Holiday.

Mayfair, N.B.—The Free church, erected several years ago, from plans by Mr. Hippolyte J. Blanc, has recently received some finishing touches which were left over at the time of the opening. The spire has been added, and internally the church has recently been decorated, and an organ and a new pulpit have been erected at a cost of over £1,500. The organ is placed in the apse at the east end. The case, designed by Messrs. Pearson, architects, Castle-street, Edinburgh, is of oak. Prominent features of it are two square towers rising to a height of 19ft., and finished with an arcading and gablet. The arcading in each tower holds five of the larger pipes, which are made of spotted metal; the other pipes are out of sight. Between the tower is a carved oak screen, the lower half of which is arcaded for three seats. Above, a smaller arcading is carried right across the screen, upon which, and upon the towers, there is a good deal of carving. The organ is by Vincent and Co., of Sunderland. The pulpit, which is also of oak, is octagonal in form, and is panelled and carved.

Rainton.—The church of St. Mary was reopened on Dec. 18, after a complete restoration. The building, though of modern date, had fallen into a state of great dilapidation, both inside and out. The absence of any damp-course over the foundations, and of drains to carry away the rain-water from the down-spouts, had caused a saturation of the walls, disintegration of the stone, and decay of the mortar. The restoration has included the removal of the old slates from the entire roof, and the substitution of green Westmoreland slates, a system of rain-water and subsoil drainage around the building, the cutting and raking out of all external joints in the masonry, and the stopping of these with Portland cement, the removal of all external decayed stonework, and the insertion of new stone, while in the inside the whole of the decayed plaster has been removed, and the substitution therefor of Portland cement. The tints of the chancel tiles are repeated in the spandrels of the nave arches and splays of the aisle windows. The main part of the work has been executed by Mr. Robt. Hudson, contractor, of Millfield, Sunderland, and the cement plaster-work by Messrs. Wilkinson and Co., of Newcastle-upon-Tyne. An entirely new heating apparatus and appliances for lighting were supplied by Messrs. Emley and Sons, of Newcastle; the tile-work was executed by Messrs. Maw and Co., Jackfield, Salop; Messrs. Jos. Potts and Son, of 57, John-street, Sunderland, are the architects.

Engineering Notes.

Dover.—The solid masonry of the new harbour extension works at Dover, now makes its appearance above the highest tides for a distance of over 250ft., nearly 400 lineal feet of the foundations having up to the present time been laid by the divers. About 2,500 concrete blocks, averaging 16 tons each, have been laid since the commencement. As many as 40 of these blocks have been laid in a single day, and a reserve of about 2,000 is kept stacked in the yards on shore ready for use. The open ironwork viaduct, which is to connect the shore with the masonry in deep water, has made great progress, and already over half the distance has been completed. As the viaduct proceeds, the chalk in the bay is found to be harder, and the work of sinking the piles 12ft. below the bed of the sea is rendered more difficult and tedious. The work of surveying the bay for the National Harbour, which was commenced by Messrs. Coode, Son, and Matthews about a month ago, is continuing, and will be completed so that plans and estimates may be ready by March.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Edinburgh Architectural Association.—A meeting of this association was held on Dec. 18, Dr. Rowand Anderson in the chair. Mr. G. S. Aitken read a paper by Mr. Thomas Arnold, who was unavoidably absent, on the mausoleum of Halicarnassus—the tomb erected by Queen Artemisia in honour of Mausolus. Mr. Arnold in the course of his paper explained that he had observed in Sir Charles Newton's plans three piers adjoining the excavation foundation, and that on examining these he had found a relation between them and the intercolumniation. From this he had started to restore the whole building. Pliny's dimensions he had taken as the basis of the restoration; but the height which Pliny gave was generally given as 140ft. Mr. Arnold's contention was that not more than 100ft. ought to be allowed. In this way the podium or base was contracted to 25ft. in height instead of 65ft., which was the dimension in the former restoration. This difference of dimension constituted the principal feature in the restoration of Mr. Arnold, who, by a number of diagrams, showed how the dimensions which he had arrived at could be included within several geometrical figures. Some remarks were made on the subject of the paper by Mr. D. W. Vallance, assistant curator of the Museum of Science and Art, Edinburgh.

New stables and kennels for the Avon Vale Hunt, at Semington, Wilts, a cricket pavilion for the Wilts County Cricket Club, at Trowbridge, and a milk factory for the North Wilts Dairy Company have recently been completed from plans prepared by, and under the superintendence of, Mr. W. H. Stanley, architect, Trowbridge, Mr. J. Wilshire, of Semington, being the builder for the first-named work, and Mr. George Moore, builder, of Trowbridge, for the other two.

The council of the miniature republic of Andorra have given their consent to the construction by the French Government of a branch of one of the great national high-roads, which will go directly through the territory of the little Republic, and afford easy communication between its capital and the road from Toulouse and Bourg Madame. In the course of next spring the surveyors will begin their work, as both Governments have come to an understanding with regard to the plan. The cost of constructing the road will be about £80,000; but, though the land over which it will pass will nearly all belong to Andorra, the French will pay for the actual road-making.

COUNTY LUNATIC ASYLUMS.—XXXVI.

By George H. Bibby, F.R.I.B.A.

DISTRICT ASYLUMS AT HOME AND ABROAD.

THE London County Asylum at Banstead accommodated, in the year 1877, about 1,250 patients, two-thirds of whom were females; but these numbers had been increased, at the close of the year 1894, to a total of 2,000 patients. Considerable additions have recently been made to this asylum, for the sick on the women's side, and for acute cases in the division for males; but these are intended, I believe, for the purpose of reducing congestion in the wards, and are not intended to afford means for increasing the number of the insane patients. Previous to the opening of the new annexes, proper sleeping accommodation does not appear to have been given to all the patients. Many of them were obliged to sleep on the floor, and the day-room space was insufficient. The accommodation has been lately increased by about 100 beds; but the Commissioners in Lunacy have declined to allow an increase of patients, upon the ground that a greater area per patient is necessary than has been arranged for in the past.

From the block-plan shown in Fig. 56, it will be observed that the wards for the male patients have chiefly a southern aspect, while those for the female patients (who are here greatly in excess) face the north, and that the buildings generally, in respect of outlook, are not so favourably arranged as is the case with the plans of asylums already given; but the institution is a large and very important one, and under the charge of about thirty officers, assisted by 127 male and 158 female attendants, &c. About fifty carpenters, bricklayers, plumbers, painters, plasterers, slaters, masons, fitters, gardeners, and labourers are employed about the premises, and have a special mess-room. This asylum is provided with a new building, for cleansing by steam the horse-hair of mattresses.

The Commissioners in Lunacy have expressed the opinion, with regard to the day-rooms of this asylum, that they are *too large* for the proper control of the class of patients who now occupy them. Many asylums would be far better planned if, with small wards and a more liberal supply of single rooms than often can be arranged for, by reason of financial considerations.

The references to Fig. 56 are: A, contagious hospital; B B, greenhouses; C, waiting-room; D, mortuary; E, engineer's house; F, chaplain's house; G, gate-lodge; H, attendants' houses.

In this asylum, a patient described as "architect" was an inmate during the past year, he being the only person of that profession out of a total number of 18,541 pauper lunatics chargeable to the County of London; but there may be some in the various private asylums.

The Banstead Asylum, in its general arrangement, is somewhat barrack like; but the wards and corridors are so decorated with pictures, and in other ways, that they are more comfortable than might be reasonably expected in an institution of this description.

At the Banstead Asylum, amongst others, the temperance policy was adopted some time since, and upon this architects may assume that for many new asylums such adjuncts as brewhouses need not in future be provided for on the general plans. I may state here that the disused brewery at the Hanwell Asylum has been converted into a dormitory, and that as a result there has been a net gain of 30 beds secured to this asylum. Dr. Alexander, the medical superintendent at Hanwell, has reported with regard to the existing temperance system in his asylum:—"I may say that this change has so far (1890) been followed by the happiest results, as evidenced by the *notable increase of contentment* and the *decrease of squabbles and bickerings* among the patients. The benefits have been most marked in the case of epileptics, *whose infirmities of temper are much less*, and whose liability to fits has been lessened."

One of the difficulties of the architect who has a large asylum plan to arrange, is that there are so many distinct departments, and that each one often appears to claim a site on the asylum estate for which another seems to have an equal suitability. The question of adding a brewing establishment to an asylum with a population of over 2,000 persons, involves also, probably, the erection of at least two cottages for the brewer and the brewer's labourers upon a site which might be better utilised. The Commissioners in Lunacy, however, have expressed themselves adversely with regard to the disuse of beer in asylums.

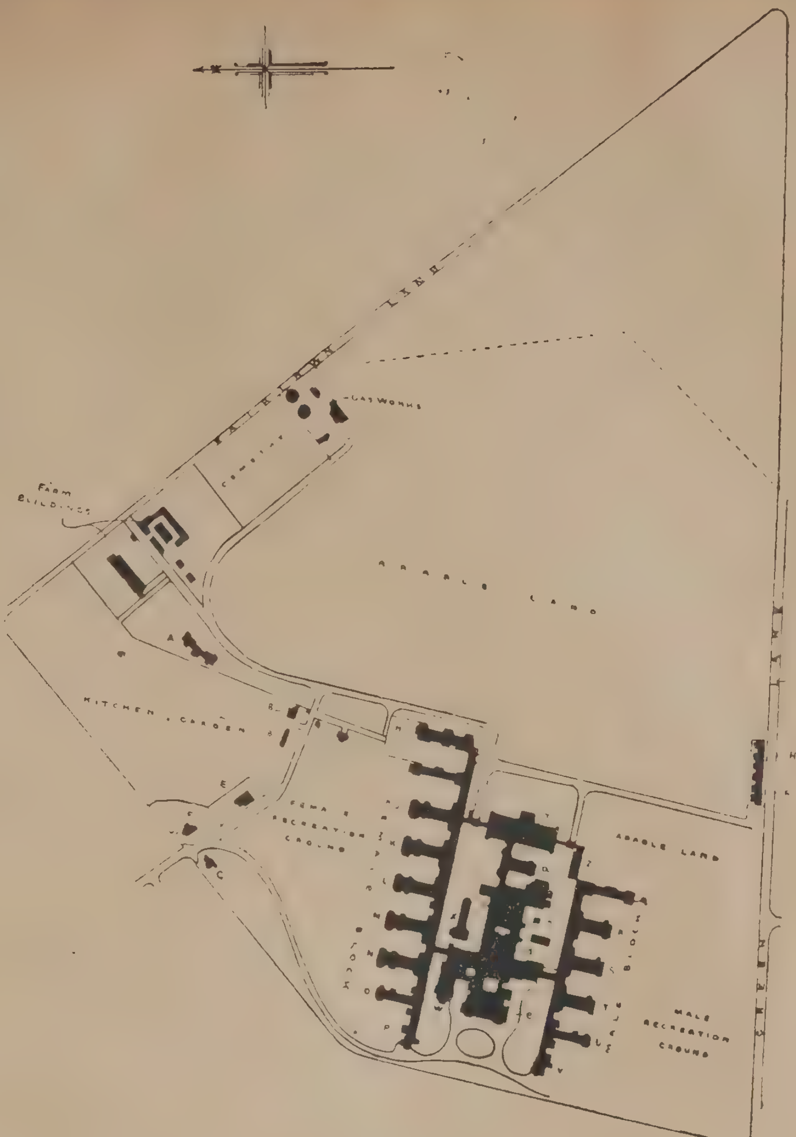

Fig. 56.

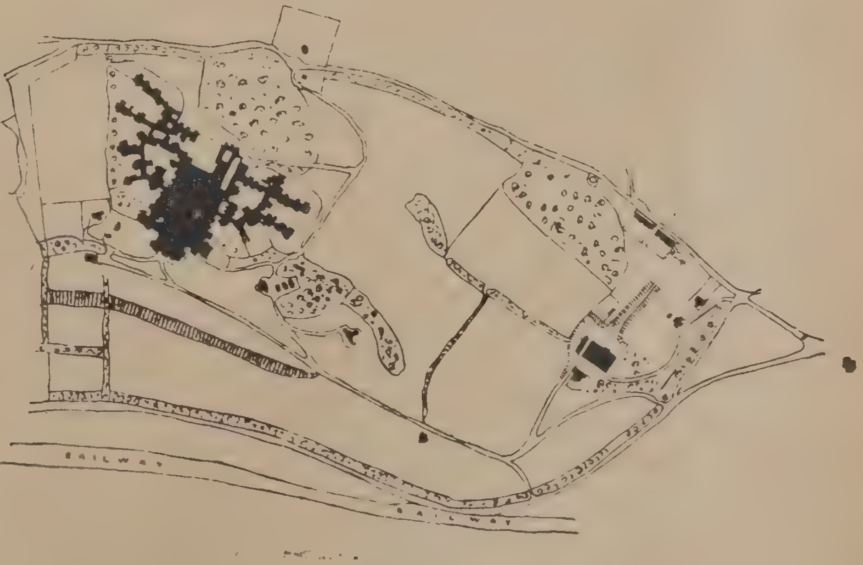

Fig. 57.

For some new asylums, therefore, architects will probably be required to provide brewing establishments, for many medical superintendents are of opinion that the wholesomeness of beer for those who are engaged in laborious physical work is most beneficial, and that water, thoroughly suitable for drinking, is frequently not obtainable. One authority is of opinion that, apart from the possible hardness of water in certain localities, "the mere ingestion of a pint or so of cold water is a serious tax on the energies of the aged, especially in winter, when the water is at a temperature not much above the freezing-point. In the first place, the shock of the cold application to the interior of the body is depressing; and in the second, to raise, by some 70°, the temperature of a pound or so of fluid of so very high a specific heat as water, is a serious demand upon the heat-forming capacity of old people." The difficulty is to find a beverage for pauper patients that is cheap, easily made, palatable, and not liable to the objections brought against cold water and beer, the last named being probably unsuited for epileptics, either in or out of asylums.

The London County Asylum at Cane Hill, which contained in the year 1884 about 1,000 patients, had, at the close of last year, accommodation for 2,018 patients. In Fig. 57 is given a block-plan showing the general arrangement and estate. Several additions have been made recently, including a nurses' block, containing bedrooms for 33 nurses, and on the top floor a large workroom for patients; additional farm buildings, attendants' cottages, shelters in airing courts, a cricket-field, pavilion, and other constructive matters. A large number of patients in this asylum appear to be induced to engage in useful employment of some description, the number of workers being 72 per cent. of the males and 65 per cent. of the females. Possibly these figures would not be so high were not the arrangements of the building favourably planned in the first instance, and a very excellent system of management maintained by the medical officers, of whom there are six, including the superintendent of the asylum.

Cane Hill Asylum is erected near to Coulsdon Common, upon a desirable site adjacent to the Cane Hill, which is used for cricket, &c., by the patients and staff. The wards of the asylum are bright, pleasant, and clean, and have the reputation of being kept in excellent order, beyond what is usual in many institutions of the kind. The asylum is supplied with water of an excellent quality from its own grounds. The sewage is disposed of by gravitation, and the fields of the asylum are thereby irrigated and manured.

All the estates attached to the London County Asylums are very irregularly divided, and in the original laying out of the fields, the parallelism of opposite sides has either not been practicable, or has not been observed. The fields and inclosures, when practicable, should be, as nearly as possible, square, if the best results are to be obtained: this being the form most suited to economy of tillage; but it is not very often possible to preserve the square or rectangular form, on account of the irregular outline of estates and farms, the intersection of highways, and the natural breaks of many kinds on the surface, such as brooks, watercourses, and inequalities of surface. All, therefore, that can be done in practice, is to approach, as nearly as circumstances admit, to the suitable form, and where irregularities are unavoidable, to cause them to be as little hindrance to an economical tillage of the ground as the case may allow; narrow strips of land, sharp corners, and intersected ridges, however caused, are always interruptions to regular tillage, and should be as much as possible avoided in the laying out of asylum fields, and where inclosures, small, irregular, or injudiciously laid out, exist, the fences should be removed, so as to bring them to the best size and form circumstances may allow. So far as is possible, the asylum fields should each inclose ground of the same nature and quality: otherwise it might be necessary to subject various parts of the same field to different kinds of culture. For instance, if a tract of stiff clay were included in the same field with a tract of gravel or sand, a different rotation of crops might be required for each division, which inconvenient arrangement would be inconsistent with the purposes of the fences.

A small asylum farm would require smaller fields than a large one; but the general rule should be that the fields should be no smaller or larger than the case requires, for by unnecessarily multiplying inclosures the ground would be uneconomically occupied with hedges and ditches, and the cost of cultivation increased. Possibly much of the irregularity in the shapes of fields has arisen by reason of the work of fencing being left to tenants who have only done the work to meet the requirements of their passing convenience.

The greater part of this country has for centuries been divided by innumerable hedges, ditches, and walls (but only since the middle of the last century has Scotland made progress in the same direction). Fences serve the purpose of protecting the growing crops, of separating the animals of the farm, and, when accompanied by ditches, of draining the fields; they serve, too, for breaking the force of the winds, and afford shelter: a country possessed of well-inclosed fields has a great superiority in the means of carrying on the works of the farms over one that is destitute of them; the capital invested in this country in such works must be enormous, although (from much useless multiplication and bad construction of them) a great part of this capital is probably misapplied. From my own observation I have found that the farm fences in the eastern and central States of America are vastly inferior to those of this country, being frequently of very feeble construction, and the finest parts of Europe are said to be very deficient as regards inclosures of land. England is supposed to have derived the knowledge of the art of inclosing from the Romans, who, although they did not probably carry sub-division of their grounds to an extreme extent, were yet familiar with methods of forming fences which would no doubt compare favourably with those adopted in many parts of the Continent at the present time.

In Derbyshire especially, the fences are generally made with loose stones forming walls of from 2ft. 6in. to about 4ft. in height; but in the matter of the picturesque, there can be no comparison between an estate divided by stone walls and those separated by hedges and ditches, and there is, in this respect, so great an inducement, apart from considerations of cost, to adopt the growing fence, that there need be little fear that the beauty of the country will ever suffer by reason of the general substitution of the wall for the hedgerow, although there are undoubtedly localities where the wall must continue to be used.

I am not aware of any asylum estates where artificial lakes or ponds exist; but at the Toledo Asylum, in the State of Ohio, which stands upon an estate of 175 acres, there are three artificial lakes within a short distance of the asylum. These lakes occupy an area of about six acres, and are in some places about 5ft. in depth, are used for skating, fishing, and rowing, and also for auxiliary water supply and sewage flushing. The area of the water surface being so considerable, it would appear a matter of difficulty to avoid disaster to suicidal patients.

(*To be continued.*)

A MIXTURE OF ROMAN AND GOTHIC.

A CORRESPONDENT writes from South Shields:—I think many of us would feel rather taken aback if asked to design a "beautiful" church in a mixture of the Gothic, Roman, and Renaissance styles. That such a building has been most successfully accomplished, not by an architect, but by a builder, is proved by the following paragraph from a local paper, and ought to make us feel very small and envious. It reminds us of the good old days when the builders were also the architects. The following is from the *South Shields Daily News*:—

"There has lately been opened in South Shields a new Free Baptist chapel. The architectural style of the structure is a *mixture of Roman and Gothic, with windows of the Renaissance period.* The main building is 62ft. by 40ft., supported on the north side by lofty stone-faced buttresses, on the south by prettily stone-gabled lecture and class-rooms, and on the west side by a picturesque stone-faced Gothic vestibule surmounted by a floral design. The church is beautifully lighted on three sides by nine large windows and two mullioned windows, while the front west window is of finely-worked stone tracery, embracing six circular lights which surround a pretty window of cinquefoil design, and the whole adorned with pyramidal and floral ornaments. There are three entrances, viz., *Gothic vestibule and Roman doors*, and ordinary side-passage approach, while the front of the structure is protected with palisadings having brick pillars with capitals of ornamental stone. The interior of the church is in keeping with the pleasing aspect of the exterior. The platform is admirable. The framework is of pitch-pine, with two projecting bays, armed seats, the front artistically decorated with sixteen symbolically-carved panels backed with crimson cloth. The seat for the speaker is a canopied armchair of pitch-pine, adorned with cut brackets and carved top, and upholstered with crimson plush, &c. The designs are from the hand of Mr. J. N——, who is also the builder of the church, and he cannot be too highly praised, both for the skill with which the designs have been made and carried out, and for the excellence of the workmanship in connection with every department of the undertaking."

We frequently hear the question asked, Why do not architects invent a new style in this the 19th century, instead of taking their instructions from Classic and Mediæval work? I have come to the conclusion, however, since reading the above, that the hour and the man have arrived.

LONDON COUNTY COUNCIL BILLS.

THE London County Council have deposited for consideration in the next Session of Parliament three measures, one dealing with finance, a second with general powers, and another with tramways. The financial scheme has for its object the consolidation and amendment of the law relating to the provision of money by the Council for expenditure on capital account. The General Powers Bill proposes to empower the County Council to purchase lands for various purposes—namely, in connection with improvement of the eastern approach to Lambeth Bridge, for the erection of a staircase at Wandsworth Bridge, and in connection with widening of High-street, Plumstead. It also deals with the purchase of land at Hackney Marshes, and the purchase of other lands for various purposes at Streatham and Shepherd's Bush. It empowers the County Council to enter upon property for survey and valuation, to stops up ways temporarily, to make subsidiary works, to alter the position of water, gas, and other pipes, and to alter sewers and drains. Amongst the other provisions is one which declares that the Bill shall not authorise the taking of 20 houses of persons of the labouring class in any parish. It gives power to lend to vestries, &c., for sanitary purposes, and makes provision as to the playing of music at Highbury-fields. The Tramways Bill provides for the construction and maintenance of tramways from the termination of the tramways of the London Tramways Company at the south-eastern end of Vauxhall Bridge-road to cross over Vauxhall Bridge, as about to be reconstructed and to terminate by junctions with existing tramways at or near Vauxhall Cross. Power is also taken to move carriages by animal or electric power. There is also a Bill dealing with the East London water supply, of which the following are the operative clauses: —Clause 2 enacts that "Notwithstanding anything in any other Act, the East London Waterworks Company shall, from and after January 1, 1897, be bound to provide and keep the supply of water constantly laid on at such a pressure as will make the water reach to the top story of the highest houses within the said limits of supply as far as they are included within the administrative County of London." And clause 3 provides that "If at any time after the said date the said company make default in complying with the provisions of this Act, they shall for every such default be liable to a penalty not exceeding £200, and to a further penalty not exceeding £100 for every month during which such default shall continue. Every such penalty shall be recoverable, paid, and applied in the same manner as provided by section 44 of the Metropolis Water Act, 1871, with respect to penalties under that Act."

DURABILITY OF IRON.

IN a discussion on the above subject in a recent number of the *Proceedings* of the Engineering Club of Philadelphia, many useful points are considered. Thus, the form of an iron column has something to do with the durability of the protective covering. One authority, Mr. W. C. Furber, says that for the best coverings known an open-section column has many advantages. The closed section permits the accumulation of water and dirt, which cannot be removed after erection. Among coverings we have paints and bituminous compounds and Portland cement; the latter, if properly applied, is said to have many advantages over the others, and one engineer observes there is no good reason why it should not be used to cover other parts of the metalwork besides those below ground. The removal of mill-scale from iron plates is one of the points insisted upon in the construction of vessels for the navy. The action of mill-scale is very corrosive, especially when the iron is exposed to water. The valuable investigations and experiments of Mr. M. P. Wood, published in his paper on "Rustless Coating for Iron and Steel" in 1894, bear on this subject. The same writer refers to the following as the best coverings—viz., cement, bituminous coatings, and paints. Painting over mill-scale, grease, and dirt is condemned; the surface to be painted should be clean and bright, and bolts and rivets be painted before rusting. The painting of the Forth Bridge is criticised and condemned on these grounds. Mr. Wood also mentions the value of asphalte coverings, and the evil effects of iron oxide paint on various structures. Another authority, Mr. C. D. Rinald, pointed out that rusting cannot take place if the carbonic acid is absent; the combination of oxygen with iron is the immediate cause of rust, but this is only possible when an acid is present. Thus a protective covering ought to prevent carbonic acid or other acid from penetrating to the iron, which then cannot combine with the oxygen. Mr. Rinald thinks that a protective paint ought not to contain any oxide at all—he would use only pigments that are not affected by acids or alkalis, and these principles are carried out, he says, in the manufacture of "Bessemer" paint. Linseed-oil he thought objectionable, unless prepared by a special treatment, as in its natural state it is porous, and is affected by weak acids and alkalis. We have no space to give all the observations made on this subject. While some of those who took part in the discussion doubt whether any paint will be discovered that will be a permanent protection to iron, others think that the result can only be obtained by experimental and practical tests. As to red-lead, one speaker said it was a good paint under certain circumstances; but where it is exposed to locomotive fumes or to any chemical fumes it will not protect. The discussion is interesting, as showing the divergent views of chemists and engineers. The theories of the former have not been generally accepted by practical men; the rival productions of manufacturers of protective coatings have not obtained the full confidence of engineers, and there is a natural desire to return to those simple protective agencies like red-lead and the heating of iron to a temperature of 400° in an oven and then dipping it into a bath of raw linseed-oil. Till we have practical experience of the durability of iron or steel under various treatments, no very satisfactory result can be obtained.

THE "NYPHOS" CLOSET.

MESSRS. J. AND M. CRAIG, of Kilmarnock, are just introducing a new siphonic wash-down closet and cistern, which offers many desirable advantages. It affords a simple and reliable method of connecting or disconnecting sanitary ware to any other kind of pipes or connections; it has a full-way, high-pressure, silent ball-tap, it is a really siphonic wash-down closet, with a full water-basin, and no valves or other movable parts, and the joints are all open to inspection. Moreover, the outlet of the closet being of comparatively small diameter, an efficient system of small-bore soil and air-pipes is thus introduced, which saves cost, and avoids the ugly adjuncts which disfigure many exteriors. It is especially worth notice that should siphonage take place when slops are emptied into the basin, the supply cistern immediately acts automatically, and the basin is at once thoroughly flushed out and left full of clean water, thus avoiding the unpleasant evidence of Mary Jane's sluttishness which so often remains in the best appointed lavatories. We have a very high opinion of this new closet, and are sure it will find wide adoption.

BOOKS RECEIVED.

The Quest has a most interesting account, by Mr. William Morris, of his beautiful old house at Kelmscott, with illustrations. There is also part of the legend of Tobit, with some curious and quaint sketches. *The Quest* has quite a unique character of its own, and is refreshingly different in type and get-up from anything printed nowadays. ——*An Architectural Account of the Churches of Shropshire*, by D. H. S. Cranage, M.A.: Part II., The Hundred of Munslow (Wellington: Hobson and Co.).—We noticed Mr. Cranage's first instalment of his important work on the churches of Shropshire, which is mainly devoted to the interesting and typical churches of Claverley, Shifnal, and Tong. The details of the splendid monuments of the latter church are fully described and illustrated. This second volume is particularly interesting, as it describes many of the beautiful edifices in the Hundred of Munslow. A large portion of this part is devoted to a description of the fine church of St. Lawrence, at Ludlow. Plates XIII. to XXV. include photo-illustrations of the interior and exterior of Bromfield Church, a unique plan of nave and north aisle—the latter of 16th-century date, also the nave. Several illustrations of Ludlow church (St. Lawrence) appear, and plan views of interior, the chancel, and two exterior views. The plan shows nave, two aisles, transepts, chapels, and chancel, and a hexagonal porch on the south side, with central tower over crossing, and is mainly Perpendicular in the interior and exterior, though Early English and Decorated are also found. Views are also given of Munslow, Rushbury, and Staunton Lacey churches. Several other process-blocks and wood engravings appear of details and tombs. The photographic illustrations are excellent, and Mr. Cranage's work will be an important addition to the ecclesiologist's library. ——*Proceedings of the Engineers' Club of Philadelphia.*—The November number has two articles of some interest: one is on the "Submerged Pipe Line for the Pennsylvania Sanitary Sewage Co. at Reading, Pa.," by William H. Deschant. The author describes the method adopted of submerging the pipes in the river crossing. A 30in. cast-iron pipe was used. The first operation was the excavation of a channel or bed across the river for the reception of the pipe, so that its invert would be about 2ft. below the river bottom; and this excavation was made by a dredging-machine. The whole line of pipe to be lowered was suspended from a trestle work, the pipes being jointed, and held in the exact relative positions they were to occupy on the bottom of river. A long screw-rod was attached to each pipe, and all these rods were lowered uniformly by placing a man at each screw, and by keeping time in the lowering. Lead joints were made; rings of asbestos packing were clamped round the joints to hold the lead while the joints were being filled. The author illustrates the mode adopted of suspending the pipe-line in position and the sinking. By a singular mistake in calculating the pipe cylinder of air of 30in. diameter and 12ft. long, and the displacement, the pipe-line floated on the water, and it was necessary to add water ballast before it could be sunk. To avoid any strain in the joints of the pipe from irregularities along the bottom, the pipe-line was suspended about 6in. from the bed of river, and gravel and cinder filling was placed at each joint, so as to provide a uniform bearing before the screw-rods were released. The paper and discussion thereon are interesting. The "Topical Discussion on the Durability of Iron" is also an interesting report, which we refer to elsewhere.

OBITUARY.

The death occurred on Friday, the 20th inst., at the comparatively early age of 55, of Mr. George Ambrose Wallis, J.P., one of the most prominent residents in Eastbourne. Mr. Wallis was estate agent to the Duke of Devonshire, and was the first mayor of the borough, a position to which he was re-elected the following year. He had been a member of the Institution of Civil Engineers since 1865, and was also a member of the Society of Arts. To his skill and taste much of the beauty, and not a little of the prosperity, of Eastbourne are due. He carried out the construction of the Parade, from the Wish Tower to Holywell, and improved the water supply and drainage of the town. In politics he was formerly a Liberal, and unsuccessfully contested the Eastbourne division of Sussex in 1885 against Admiral Field. Mr. Wallis, however, subsequently threw in his lot with the Liberal Unionists.

* * *

A memorial stained-glass window was unveiled on Sunday week in the parish church, Laurencekirk, N.B. The subject chosen represents Our Lord in the Garden of Gethsemane being visited by the Comforting Angel. The design and execution were intrusted to Messrs. Ballantine and Gardner, Edinburgh.

On behalf of the Local Government Board, Mr. Rienzi Walton held an inquiry last week at the Town Hall, Birkdale, into the application of the Birkdale Urban District Council to borrow £1,074 for the extension of gas-mains and lamps, and for the introduction of sewer-ventilating lamps; and £149 for a mortuary. The surveyor, Mr. J. H. Fairburn, produced the plans. Touching the proposed mortuary, the inspector asked many questions on learning that the site suggested was midway between the Weld-road and the Oxford-road slopes—that is, on the foreshore, in full view of the main front of the Palace Hotel and the part of the sands most frequented by nursemaids and young children in the summer. The inspector asked if the lord of the manor had been informed of the proposed site, and the reply was in the negative.

COMPETITIONS.

Philadelphia.—Sixty-seven designs sent in in competition for the proposed new museum to be erected by the City of Philadelphia in the original Fairmount Park, on the east side of the Schuylkill, were submitted to a jury, consisting of Messrs. D. H. Burnham (as chairman), Mr. Stanford White and Professor Ware, of New York, and Messrs. J. M. Wilson and Johnson, of Philadelphia, who were asked to report the best eight to the Commissioners. They spent two days in making this selection, and a fortnight in studying photographs of these eight designs with a view to a final report. This they have presented to the Commission, recommending that the four prizes of 6,000dol., 3,000dol., 2,000dol., and 1,000dol. should be given to the designs marked "Keystone," "Acropolis," "Black Seal," and "Nike." The other four selected were marked "Proportion," "Maltese Cross," "Quantum Valeat," and "Φ." The Commission have voted the premiums in accordance with their recommendation. On opening the envelopes it appeared that "Keystone" was the work of Messrs. James Brite and Henry Bacon, of New York; "Acropolis," of Messrs. Lord, Hewlett, and Hull, of New York; "Black Seal," of M. de Montclos, of Paris; and "Nike," of Messrs. Howard and Cauldwell, of New York. M. de Montclos's design consisted of an open semicircular corridor, or arcade, from which radiated the twelve picture galleries called for by the programme, six on each side of a central hall, beyond which was a vast circular hall covered with a dome. The other three designs all had for their principal feature three lofty halls *en suite*, lighted from the roof, and inclosed first by a corridor and then by galleries, in two stories, for sculpture below and for paintings above. In "Nike" and "Keystone" the central compartment was covered with a dome. In the schemes of "Acropolis" and "Nike" three courts were shown at the side of these, two open above, the central one covered, and in that of "Acropolis," covered with a dome. "Nike" and "Acropolis" showed more or less extensive galleries or corridors branching out into the park. "Keystone," which was the largest of all, measuring about 300ft. by 600ft., was also the simplest, showing no accessories whatever.

CHIPS.

A full-size portrait of Captain Reed, of Belhunt, the first commanding officer of the Falmouth Rifle Volunteers, has been hung in the town-hall of that borough. The artist is Mr. Sydney Hodges.

The enormous extent of the forests, and also of the lumber industries of the north-west of Canada, is indicated by the fact that this year Washington will make shipments of lumber aggregating 400,000,000ft., Oregon 150,000,000ft., and British Columbia 40,000,000ft.

The Wesleyan chapel at Kilburn, near Thirsk, is being rebuilt and reseated from plans by Mr. T. Stokes, of Thirsk. The works have been let to the following contractors: J. C. Cornforth, of Coxwold, brick, stone, and plasterers' work; R. Leadley and Sons, of Helperby, carpenter and joiners' work; J. Baynes, Ripon, slating; and H. Savage, Coxwold, painting.

Mr. W. H. Stanley, A.M.I.C.E., of Trowbridge, has received instructions to prepare plans, &c., for the sewage disposal of that town, and is also engaged in preparing a scheme of water supply for the town of Westbury, Wilts, for the Westbury and Whorwellsdown Rural District Council.

The watching and lighting committee of Glasgow Town Council have recommended that the circus ground in Ingram-street should be acquired from the City Improvement Trust for a new fire-station, on condition that the erection of buildings should not take place for several years.

The Court of Common Council have decided to make arrangements for a supplementary exhibition in the Art Gallery at Guildhall next summer. The Court have also resolved that the early City records should be printed *in extenso* and published with full indices and such translations and notes as may be necessary. It has been referred to the library committee to report what sum would probably be required to produce one or two volumes each year.

Mr. Edwin J. Brett, who died on Dec. 16, originated a certain class of boys' sensational literature, but will be better recollected by our readers as an expert in and one of the foremost collectors of ancient armour: a portion of his collection was sold at Christie's in the spring for £30,000. Mr. Brett, who published last year an illustrated work on "The Origin and Development of Arms and Armour," was 68 years of age.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—S. R. and Co.—E. Rogers.—Architect.—F. G. S.—R. L. C. Co.—B. T. (Taunton).

Correspondence.

PROPOSED NATIONAL AND PROVINCIAL UNION OF BRITISH ARCHITECTS.

To the Editor of the Building News.

> Now join your hands, and with your hands your hearts,
> That no dissention hinder government. . . .
> What might thou do, that honour would thee do,
> Were all thy children kind and natural?
>
> —Shakespeare.

Sir,—It has been stated that there is a large amount of selfishness amongst architects; yet I am inclined to think that a great deal of what to outward sight appears to be such, might, with more truth and propriety, be styled morbid indifference of a superficial character only; being nothing more or less than a thin conventional veneer, often covering a hidden wealth of true British heart of oak. Once let us break through this foreign element, and trust and confidence will be established where diffidence and distrust before reigned supreme. Only the assurance produced by the consequent power and influence of a truly National Union could effect this transformation.

This veneer no doubt we have unconsciously contracted and put on during the drossy age; it has been begotten, in many, by a dull sense of disappointment and despair, developing into a chronic state of indifference as to our rights or our wrongs as a professional body. It has been suggested that the Institute might possibly bring about a nominal alliance with itself, by a federation of the associations—it matters little which, because, for the purposes of a general union, even if practicable, it would be totally useless, and, without doubt, our future state would even be worse—which is saying a great deal—than the present.

Yes, the Institute might do all this, nominally, but would this alter the complexion and constitution of the associations themselves? For every purpose of a union they would remain as now—powerless, nerveless, and totally void of that vigorous life and concentrated energy, so essential and requisite for the effective working and successful management of a national union. It would but constitute a mended thing, and, at the best, anything that is mended is but patched. The greatest calamity that can come to use now would be to have foisted upon us a sham union, a union of shreds and tatters, a partial, contracted, pinched, secondhand occasional union, a thing living on sufferance, and having to beg for the crumbs that may fall from an upper table. Even if it were desirable that the Institute should endeavour to fashion a union directly or indirectly, its very constitution effectually debars it from forming any such comprehensive body which should embrace the whole of the *bonâ fide* practitioners, not being members of the Institute. No, its limited discretionary power is fatal to any such dreams. Should such a thing be attempted I am certain that it would end calamitously: the Institute would suffer, and no useful purpose would be attained. A union, to be a union worthy of the name, must undoubtedly rise, stand, or fall alone. To call anything less than this a union, is a misnomer. It is not a thing to be tacked on to an existing society, as a shopkeeper would tack a ticket on to an article for sale or exhibition. No, it must be the thing itself, complete in itself; a new creation, and our equipment, with our purpose, ought both alike be new. There is no reason, however, that the union, once established, should not exist in the strictest harmony and closest possible relations with the Institute, &c.

Perhaps, figuratively speaking, the true and, in real fact, the only position which a union of architects can occupy, in order effectually to repel the inroads which are continually being made upon the legitimate rights of the profession, would be to act as a cordon of outposts. We must found and firmly establish a strong impregnable outer line of defence, a force acting as one, in strict unity, and, again, in close communication with those within the citadel. These outposts will clearly have a work entirely their own, being peculiar to and consequent upon their exposed position, and which could not be undertaken or accomplished by those on the walls or within the city—the associations—and much less so by those who man or furnish the inner keys—the Institute. Now, figuratively, I take it that the inner fortress, or keep, may very well be likened to the Institute, and the city and walls answering for the different associations. Briefly, then, the paramount duty of the union is to *watch*, to be for ever on the alert; to carefully examine and test the genuineness of all credentials, the validity of every passport of all who would seek to cross the lines. Secondly, to give the alarm, and repel every attack from without whenever occasion arises. It is quite apparent that these duties of outer defence cannot be undertaken by those within the city. I therefore maintain that the union should be a separate and permanent self-contained organisation, with its own independent officers to command. I know there are those who are very jealous of the dignity and privileges of the Institute, and no one honours or respects them more than I do for their patriotic and honourable bearing; but in the formation of a distinct union of architects, nothing is being attacked or sought for which in any way encroaches upon, or by right belongs to, the Institute, or could, under any circumstances, be incorporated, so long as it is constituted as at present. Had I not been positively assured in my own mind that the formation of an independent union, far from doing the slightest injury to the Institute, would rather in every way tend to greatly benefit, and secure its best interests and welfare, I certainly should never have proposed it. I firmly believe it will be the means of increasing its numerical strength in a way nothing else can, and raise its somewhat nominal power into something real and substantial; and I predict the day is not far distant when its members will with one consent have reason to thank God we have got a union. To some it may require an effort of a peculiar nature, to step aside, as it were, out of the beaten track and make a little sacrifice of time and inclination; but surely the cause is fully worthy of such an effort. But alas! as you, Sir, have told us, architects "lack gall to make oppression bitter," and nevertheless "The loss, the gain, the rendering on't is all properly ours," so "Let silken dalliance in the wardrobe lie."

Finally, as I have already stated, the formation of a union as above will greatly tend to increase the membership of the Institute and kindred associations, whereas a federation of the associations affiliated to the Institute, would have exactly the contrary effect, and prove most disastrous, as more would be content to be simply members of a provincial society and nominally attached to the Institute, than be fully-admitted members of the R.I.B.A.

No doubt many of your readers have not seen this correspondence. Those who have will, I trust, call the attention of others to this vital question. Allow me to thank all those who, in response to my last letter, have forwarded me their names, and to invite those who have not as yet, to do so without delay. And with grateful acknowledgments to you, Sir—I am, &c.,

Durham, Dec. 21. George Ord.

Intercommunication.

REPLIES.

[11467.]—**Fumigated Oak.**—If an "Old Crow" will refer to his Building News for Sept. 16, 1881, he will find the same query (No. 6639) replied to by myself. As he may not have the copy in question at hand, I reproduce the reply in question. Here it is:—"Fumigating Oak.—Oak is fumigated by liquid ammonia, strength 880, which may be bought at any wholesale chemist's at 5s. a gallon. The wood must be placed in a dark and air-tight room or compartment, and plates or dishes of ammonia stood upon the ground. This done, shut entrance and secure cracks with pasted strips of paper. Remember the ammonia does not *touch* the oak; the gas acts in a wonderful manner upon the tannic acid in the material, and browns it so deeply that a shaving or two may be taken off without removing the colour. The grain is not raised in the least, and the depth of shade will entirely depend upon quantity of ammonia used, and the time the wood is exposed. Try an odd bit first, and then use your own judgment."—Harry Hems.

CHIPS.

The cattle market at Colchester is about to be reconstructed and inclosed by iron fencing, from plans prepared by Mr. H. Goodyear, the borough engineer and surveyor.

Messrs. Shanks and Co., sanitary engineers, Barrhead, N.B., have just secured a contract from the Melbourne Board of Works to supply 8,000 three-gallon cisterns. The contract amounts to £70,000.

An área of 12,924 square miles was under the control of the Bengal Forest Department during the year, and of this 45 per cent. consisted of fully reserved forest land, the remainder being composed of protected and unclassed State forests.

The *West Briton Advertiser* illustrates its sheet almanac for 1896 by a perspective of the Free Library at Camborne, one of the many institutions of the class erected, or in course of erection in Cornwall, at the expense of Mr. J. Passmore Edwards. The library at Camborne has been built from plans by Mr. Silvanus Trevail, M.S.A., ex-Mayor of Truro, and was opened in May last.

At Cardiff, on Friday, Sir John Gorst opened the new offices of the school board in Howard-gardens, and afterwards laid the foundation-stone of a new college for pupil teachers.

Trinity Presbyterian Church, Bootle, near Liverpool, was reopened on Sunday after works of internal decoration, carried out by Mr. George Parr, of Stanley-road, Bootle.

A fire-brigade demonstration took place at Newcastle-under-Lyme on Friday in honour of the opening of the new fire-station provided for the Newcastle brigade by the corporation. The station is the old School of Art in King-street, the premises having been renovated and adapted to their new purpose. The cost of the conversion has been about £350.

A new organ, built by Messrs. Nicholson and Lord, of Walsall, was dedicated on Friday at St. John's Church, Horninglow. It has cost about £700.

The Boston Harbour Commissioners have resolved to expend £5,000 in dredging the river to a level bottom, from the dock downwards, 2ft. below the dock sill, so as to allow vessels of larger draught to enter the dock without being lightened in the Deeps.

On behalf of the Local Government Board, Mr. Rienzi Walton held an inquiry on Thursday in last week at Hesketh Bank into the application of the Ormskirk Rural District Council to borrow £8,550 for works of water-supply for Tarleton and Hesketh-with-Becconsall. Mr. J. A. Broady, the engineer, said the scheme was to extend the Preston Corporation supply already about to be carried to Hoole. The original extension scheme was costing £9,800 for 17 miles, and this supplementary extension would cost £8,500 for 21 miles. Mr. J. J. Myres, C.E., Preston, endorsed the scheme.

Legal.

RESTRAINTS ON ALTERATIONS.

SOME landlords seem to think they can do as they like in regard to premises they own, although these are let to tenants under continuous leases or agreements. There is, indeed, a very common idea that a landlord may exercise all sorts of arbitrary powers which no one else would think of assuming, such, for instance, as raising the rent upon a tenant without first determining the tenancy. But even tenants have legal rights, and this was well shown in a recent and rather curious case relating to Oxford Mansions, Oxford-street (*Times*, 14th Dec.), and noted in our issue for last week, Dec. 20th. The plaintiff was a Mrs. Hudson, tenant of a second-floor flat in these mansions, which had been built and used hitherto as residential flats, and her action was for an injunction to restrain the defendant, the landlord, from going on with certain alterations of the premises undertaken by him with a view to providing accommodation for a new club. The block of buildings are in much the usual form, being quadrangular, with a court in the centre, and having one common entrance and staircase for the use of all the tenants. The plaintiff held under an agreement for one year from March last, determinable by the tenant at one month's notice after this first year, and by the landlord on the same notice after three years. Until recently the whole premises had been used as flats; now the landlord was about changing them into a club with bedrooms upstairs.

Mr. Justice North considered that the plaintiff's agreement showed that the building had been for years used and occupied as residential flats; and it was intended that they should be so continued. If the defendant persevered with these projected alterations, the whole character of the place would be changed, and the plaintiff, instead of having her flat isolated in the usual way, as she had agreed for, would have her rooms in the middle of a fashionable club. In an earlier case, the Court of Appeal had laid down as a practical principle that a lessor could be restrained from letting houses in a block of buildings in such a way as to be inconsistent with the restrictions imposed upon the lessees generally. Applying this to the present case, the judge granted an injunction to prevent these premises from being used in any other way than as residential flats, so the landlord must first arrange with his tenants before he proceeds.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Mr. E. Onslow Ford, R.A., has been commissioned to execute the memorial statue to Professor Huxley, which is to be erected in the Natural History Museum, South Kensington. It will be the third statue placed in the great hall of that institution, the two already there being those of Darwin and Sir Richard Owen. The memorial fund has now reached a total of £1,550.

In the case of Frederick Jackson, of Hampshire Lodge, Church Hill-road, Walthamstow, builder, the discharge from bankruptcy has been suspended for three years, ending Nov. 14, 1898. In that of Arthur Lindfield, of Kelmscott-road, Wandsworth, S.W., builder, the discharge has been suspended for four years, ending Nov. 25, 1899.

The footbridge erected by the London County Council to connect Gospel Oak and that district with Parliament Hill-fields, Highgate, was opened on Saturday afternoon. The Hampstead Junction Railway divides the district from the recreation grounds, and for a mile—that is, between Gospel Oak and Hampstead Heath railway stations—no means were provided for the public to cross the line. The footbridge crosses the railway at a point where a former footpath passed through the fields. The bridge is of steel, with piers of blue Staffordshire brick, and is 20ft. wide. It has cost £2,400. The land for the approach on the Gospel Oak side near Roderick-road was purchased and the road made by the St. Pancras vestry, at a cost of about £1,300.

Herr Dörpfeld, president of the German Archæological Institute at Athens, has resumed the work of excavation at the south-west of the Acropolis, and has discovered two statuettes of Hecate and Demeter in brass. The German Government has furnished the Institute with sufficient funds to prosecute the researches thoroughly.

LEGAL INTELLIGENCE.

The Failure of Grimsby Builders.—A special sitting of the Grimsby Bankruptcy Court has been held for the public examination of Messrs. Guy and Gooseman, builders, Willowgate, Grimsby. The liabilities were £4,982 11s. 9d., and the assets £1,750 2s. 6d., showing a deficiency of £3,232 9s. 3d. The debtors were each examined as to the partnership, contracts, debts, &c., and particularly with reference to a deed of assignment respecting some property in Blundell-street, Cleethorpes, and a brickyard. The examination was adjourned.

A Sheffield Street Improvement Arbitration.—An important arbitration was opened at Sheffield on Wednesday week, in which Mr. John Walsh claims £66,000 from the corporation in respect of his interest in premises on the south side of High-street, and the disturbance of business arising from the acquisition of the property by the corporation. The umpire is Mr. Daniel Watney, of London, president of the Surveyors' Institute, with Mr. Frederick Fowler, as arbitrator for the claimant, and Mr. Thomas Fenwick as arbitrator for the corporation. Mr. Walsh commenced business in 1875 with a capital of £1,200. His turnover for the first year was £5,500, last year it was £129,000, and his profits had increased in proportion. Two-thirds of his business was carried on at the premises the corporation require, and he claims for freehold and leasehold interests, compensation for disturbance, and so forth.

Leeds.—An arbitration is being held at the Leeds Town Hall for the purpose of assessing the purchase money and compensation to be paid by the corporation to the trustees of the late John Cunningham, the owners of premises in North-street, extending from Melbourne-street to St. Thomas-row, which are required for the widening of North-street. The inquiry was held before Mr. Richard Horsfall, of Halifax, sitting as the umpire appointed by the arbitrators—Mr. C. F. Wilkinson, architect and surveyor, for the claimants, and Mr. J. M. Fawcett, land agent and surveyor, for the corporation. The net building area is 342½ square yards. Mr. Robert Wood, contractor and surveyor, valued the property at £5,802 10s.; Mr. James B. Waite, estate agent, Leeds, as £5,012 14s.; and Mr. Charles Fowler gave his valuation as £5,544. Mr. John Hepper, auctioneer and valuer, gave evidence on behalf of the claimants, and valued the property at £4,943 8s. For the corporation, Mr. Thomas Ambler, architect, valued it at £3,639 1s. 6d., Mr. W. D. Hollis, auctioneer, at £3,494 12s., and Mr. Charles Myers, builder, at £3,629 3s. 6d.

Re Alexander M'Clymont.—A sitting for public examination was held on Friday. The Bankrupt was described of Cathcart-road, South Kensington, builder, but he states that he has had no regular occupation since 1878, when he and a partner, who were trading as builders, failed, with liabilities amounting to about £150,000. He now returned his liabilities at £4,558, of which £3,257 is unsecured, and assets £28 14s. He had engaged in betting transactions, and thought they had resulted in a small profit, perhaps of about £50.—The examination was adjourned for a month.

Alleged Forgery and Perjury by Highway Surveyors.—A case of considerable interest was brought under the notice of the West Riding Bench at Wakefield on Friday, and after having been formally opened, was adjourned until Friday, January 10. The defendants were Elijah Farrar, recently of Lofthouse, but now of Leeds, and Charles Holden, colliery check-weighman, of Bragg-lane End, and they had been summoned on charges of having committed perjury and forgery. The two defendants, from Easter, 1894, to Easter, 1895, were the surveyors of the highways of Wrenthorpe, and in due course they presented their accounts to Mr. Rich, the district auditor. The auditor, however, detected that the defendants, or one of them, had obtained duplicate vouchers in three cases, and these they attempted to make use of a second time. The auditor surcharged the defendants with the amounts in question, and these sums were paid by the defendants, who now appeared surprised to find that criminal proceedings were taken against them. One of the duplicate vouchers was for £33 6s. 10d., paid to Messrs. Tennant and Nightingale, of Thornton-in-Craven, for road material. Another was for £3 16s. 10d. paid to Mr. Thomas Armitage, brick manufacturer, Lofthouse Gate, for material supplied and team labour. It was alleged that vouchers were tampered with and figures altered. The defendants were admitted to bail.

Architect and Alleged Man-of-Straw Building Owner.—At Bow-street Police-court on Friday Kent Pinchbeck, an architect, living at St. John's, Woking, and having offices in York-buildings, Adelphi, and Alexander Martin, architect's assistant, of St. George's-road, Leyton, were charged on remand with fraud. At the previous hearing it was alleged that Pinchbeck obtained a piece of land at Northwood, Middlesex, and induced builders to erect villas upon it, saying that Mr. Miles Atkinson, of Blackheath, whom he represented to be a very wealthy man, would be responsible for the money. The builders were paid certain sums, but were unable to obtain the balance, which in the case of Messrs. Wilkinson and Co. amounted to £445. It was further alleged that Pinchbeck sold the ground-rents for £1,530, and that the prisoner's wife (to whom the buildings had been transferred) mortgaged her interest in them for upwards of £2,000. The builders could obtain no information as to Mr. Miles Atkinson, the supposed capitalist, except that he lived at Blackheath. At the hearing on Friday Mr. Crawshaw cross-examined Mr. George Wilkinson, one of the prosecuting builders, who said he understood that Martin was Pinchbeck's manager. A shorthand writer produced a transcript of his notes of the trial "Kellett *v.* Pinchbeck," in the High Court, before Mr. Justice Mathew, attention being called to the fact that Pinchbeck stated at the trial that Miles Atkinson lived at No. 5, Wemyss-road, Blackheath. Miss Stapelton stated that she had lived at 5, Wemyss-road, Blackheath, for eleven years, and did not know anyone named Miles Atkinson. Jabez Holloway, clerk to Messrs. Welman and Sons, solicitors, Southampton-street, Bloomsbury, produced conveyances of land in which the name of the prisoner Pinchbeck appeared as vendor. Godfrey H. Boyd, solicitor, produced leases relating to these same plots. Pinchbeck's letter-book, produced, contained the following letter, addressed to the Singer Company by the defendant, referring to Miles Atkinson:—"Gentlemen,—I am in receipt of your inquiry as to Miles Atkinson. I have known him from a very tender youth, and I consider him honest, sober, trustworthy, willing to oblige, and one who will do his best for his employer's interests. P.S.—You might have had the courtesy to put your communication in a plain envelope. Gentlemen do not receive business letters at their clubs." In the index of Pinchbeck's ledger were the names of many clients, but that of Miles Atkinson did not appear there. In a pocketbook handed to him by the office attendant, he had found, however, the following entry in Pinchbeck's handwriting:—"Miles Atkinson, 49, Packington-street, Essex-road, Islington." No one of that name was known there. Prisoners were again remanded.

Compensation Case at Streatham.—Sir P. H. Edlin, Q.C., was occupied on two days in last week in hearing a compensation case arising out of the widening of Streatham High-road, rendered necessary by the construction of the new cable tramway. It was proposed to pull down the front garden wall of a house called Brynbella, occupied by a Mrs. Goldsmith, and move it back 4ft. or 5ft. On the strip of land thus appropriated, which was 125ft. long, were growing six tall elm trees, which screened the house from the road, and which were said to form one of the chief attractions of the house, and these, it was thought, would have to be removed. The present claim for compensation was made by Messrs Hill and Smith, Mrs. Goldsmith's lessors, who themselves held the house on a lease from the freeholders, which had 48 years yet to run. Several expert witnesses were called on their behalf, who said the value of their interest in the premises would be depreciated by about £800. The witnesses on the other side were of opinion that the new garden wall could be so built that the trees could be included in it, and that it would be necessary to remove only one of them. They estimated the compensation to which the claimants were entitled at £20. The jury assessed the compensation at £453. Sir P. H. Edlin remarked that it was to be hoped that the verdict would enable the parties to two other cases arising out of the same matter, one of whom was Mrs. Goldsmith, to come to an agreement.

Estate Agents' Commission.—Clutton v. Clarke.—Mr. Justice Wills recently heard an action brought by Messrs. Clutton and Sons, surveyors and estate agents, Whitehall-place, to recover under a contract the sum of 800 guineas for work done in making a valuation of certain leasehold property of a special character, or, in the alternative, to recover on a *quantum meruit.* In 1892, the defendant, Mr. Thomas Clarke, the owner of the Chancery-lane Safe Deposit, was anxious to form a company to take over that property. He instructed the plaintiffs to make a valuation of the property, and he agreed to pay them 100 guineas for a preliminary report in any event, 500 guineas for the report if it was made use of for the purposes of promoting a company, in the event of the company being formed, and three-fourths of the capital was subscribed for, and 800 guineas if the whole of the capital of the company was taken up. A considerable time elapsed before the valuation was actually made, because Mr. Clarke was carrying out alterations and improvements in the basement. In March, 1894, instructions were given to prepare the valuation, and in it the plaintiffs stated that the rents of the block of buildings amounted to £22,200 per annum, as against £15,230 at Christmas, 1887, when at the request of the defendant they had made a valuation of the buildings then occupying the site, and for which valuation they were duly paid. In the present valuation the plaintiffs estimated that the buildings, excluding the Safe Deposit, would yield a gross rental of £26,000, that the safes and strong rooms would produce about £30,000 a year, and that the value of the leasehold interest as between vendor and purchaser was £387,000. Eventually an offer of £280,000 for the whole concern was accepted, and the property was sold to the syndicate. The plaintiffs sought to enforce their claim for 800 guineas, alleging that the contingency upon which that payment was to become due to them had happened. Mr. Clarke denied this, and said that the 100 guineas he had paid into Court was all that they were entitled to under the contract. For the plaintiffs it was contended that the full sum of 800 guineas was due, and that it was less than the fee ordinarily charged for work of this kind, so that the defendant could not plead he had made a bad bargain. Mr. Ralph Clutton, one of the plaintiffs, was called, and said that his firm had made the valuation in question. He considered it to be a fair valuation, considering the figures supplied him by the defendant. The Surveyors' Institution had a scale of charges for such work. His fees under that scale would have amounted to upwards of 997 guineas. Mr. Samuel Garrett, of the firm of Parker, Garrett, and Parker, gave evidence to the effect that the property was sold to the syndicate for £280,000, and that the defendant agreed to supply that company with a copy of Messrs. Clutton and Sons' valuation, and to produce the original when required. Mr. Mills, solicitor, practising at Stroud, stated that he was one of the directors of the company which acquired the defendant's property. The property was purchased for £280,000, the substantial part of which was raised on mortgage. The nominal capital of the company was £100,000, but only £70,000 had been subscribed. Sir E. Clarke, for the defendants, submitted that three-fourths of the capital had not been raised, and consequently that the plaintiffs were entitled to only 100 guineas, which sum had been paid into court by his client. Mr. Justice Wills, after hearing arguments on the construction of the contract, held that the plaintiffs were entitled to receive only 100 guineas. The question was decided by the express terms of the contract. Three-fourths of the capital of the company had not been subscribed, and therefore only that sum was due to the plaintiffs. The question of *quantum meruit* did not come in, therefore, at all. As the defendant had paid 100 guineas into court in satisfaction of the claim, he would be entitled to judgment.

Alleged Breach of Covenant. — Smith v. Meeks.—The site of the old Baptist College at Stepney was, about forty years ago, let on building leases for the erection of dwelling-houses. One of the buildings in King John-street had for thirty years been utilised as a beerhouse, and the trustees of the college, which is now situate at Regent's Park, sought, by an action which was before the Queen's Bench Division last week, to recover possession of the house on the ground of a breach of covenant. For the defence it was argued that the premises were constructed under the supervision and with the approbation of the plaintiff's architect and surveyor, and that the plaintiffs were bound by their agent's acts. Plaintiffs rejoined that they had no knowledge that the house was being used for the sale of beer until a short time prior to the commencement of the action, and that their architect and surveyor had no authority to waive any covenant of the lease. Mr. Justice Wright said he was satisfied that the agents of the trustees had assented to the premises being originally built as a shop and not as a dwelling house, and he gave judgment for the defendant, with costs, but execution was stayed pending an appeal.

* * *

Lord Rowton's Model Lodging-House for Men in the King's Cross-road, London, which has recently been completed at a cost of nearly £40,000, will be opened during the first week of January. The building affords sleeping accommodation for 800 men.

The Mercers' Company, as administrators of Dean Colet's bequest, have just purchased for £10,500, a freehold site at West Kensington, for the erection of a girls' school, which is to be founded in accordance with the scheme settled a few years ago. The property comprises nearly three acres of ground, and includes the Grange, Brook-green, an adjacent house and grounds known as "The Convent of our Lady of Zion," and other smaller premises.

On Saturday a new drill-hall, which has just been erected in Market-road, Carluke, N.B., by D Company 9th Lanark R.V., was opened. The building occupies a site nearly opposite Market-place Public School, and has all the appearance of a military fort, which is made further realistic by the presence of a cannon occupying a position on the ground almost in front of the main door. Besides a drill-hall there is a gymnasium, sergeant-instructor's house, armoury, and reading-room. Mr. David Andrew is the architect.

WATER SUPPLY AND SANITARY MATTERS.

Bath.—The question of the river purification and sewage disposal was again discussed at the last meeting of the city council, the bill of Mr. Radford, C.E., of £1,228 for preparation of plans, which was referred back to the committee for further consideration as to the terms of the agreement with Mr. Radford, being again recommended for payment. The bill was at length passed. The council were generally of opinion that there was no alternative but to pay the bill, though a member remarked that it came to him, as it did to others, as a great surprise to hear that an expense had been incurred in the matter of something like £1,700.

Experiments in Sewage Purification.—At a recent meeting of the Sanitary Institute, held at the Parkes Museum, Margaret-street, W., Sir Benjamin Baker in the chair, Sir Douglas Galton read a paper on the "Lessons to be Learned from the Experimental Investigations by the State Board of Health of Massachusetts upon the Purification of Sewage." After dealing with the varions systems of sewage filtration, he described the systems devised for the aëration of the filters, dealing more particularly with experiments made by Colonel Waring at Newport, New York. He summed up the conclusions to which the various experiments lead as follows:—(1) The suspended matters of sewers (sludge) can be mechanically withheld by straining slowly through suitable material. (2) The filth accumulated by this straining material can be destroyed, and the straining medium restored to a clean condition by mere aëration. (3) The successive alternate operations of fouling and cleansing can be carried on indefinitely without renewal of the straining material. (4) The purification obtained by this straining process practically equals that accomplished by chemical precipitation, and is sufficient to admit of discharge into any considerable body of water not used as a source of domestic supply or for manufacturing purposes requiring great purity. (5) Such filters can be maintained in constant and efficient operation by suitable aëration. (6) The erection of a plant capable of purifying large volumes of sewage upon a relatively small area calls for no costly construction. Repairs and renewals are merely nominal. The attendance required is but slight. There is no outlay for chemicals, &c. The only expense of mechanical operation is the driving of the blower or air-compressor. (7) The process admits of wide variation in the selection of filtering material, and nearly every community can find in its local resources something suitable for the purpose.

Southend-on-Sea.—The inquiry instituted by the Local Government Board into the proposed new regulations for the Southend Water Company was resumed last week before Col. Coke, A.M.Inst.C.E., J.P., D.L., one of the Inspectors, at the Institute, Clarence-road, Southend. At the close of the proceedings a compromise was agreed to on behalf of the corporation and the water company. The flush from a cistern was increased from two gallons to two gallons and a half, and the siphon flush was allowed, provided that it should not discharge more than two and a half gallons at each flush. With regard to stop-cocks and draw-cocks, it was agreed to approve of "not less than three patterns, not more than one of which three should be the subject of a patent." The amended regulations having been signed by counsel for the company and for the corporation, the inquiry was concluded.

CHIPS.

Two stained-glass windows have been placed in the parish church of Portobello, N.B. The one represents the scene of Moses' descent from the Mount with the Tables of the Law; the other depicts Paul preaching at Athens.

Mr. Hubert Herkomer, R.A., has been elected vice-president of the Royal Society of Painters in Water-Colours, and Mr. S. J. Hodson has been elected secretary, vice Mr. Ridge, who takes the post of curator.

The Southport Spring Exhibition of Pictures will open on the 2nd of March. The receiving days are January 16 to 21, both inclusive.

The plans of Messrs. Paley and Austin, of Lancashire, for the proposed higher grade school for Keswick, have been approved by the governors of the Crosthwaite high school.

Herr Sommer, the chief engineer of the Municipal Electrical Works at Frankfort, has been killed by a discharge of the electric fluid of the strength of about three thousand volts.

The Free Land League, the presidency of which was accepted by Mr. F. A. Channing, M.P., when Sir Arthur Arnold became chairman of the London County Council, is taking a new departure, and will henceforth be known as the Land Law Reform Association. Negotiations have been completed for the amalgamation of the Leaseholds Enfranchisement Association with it.

Our Office Table.

Two sites of historical interest in Westminster Hall will in future be easily found by sightseers, the First Commissioner of Works having had commemorative tablets erected as guides. One of the tablets in question is affixed to the east side wall, near the south-east angle of the Hall, and the other is let into the floor in the centre of the building, not far from the doorway in the eastern wall which leads to the House of Commons. The former indicates the site of an ancient doorway, which, from 1547 to 1680 was the principal access to the House of Commons, which then sat in the Chapel of St. Stephen, and, to quote from the inscription: "King Charles I. passed through this archway when, on January 4, 1641-42, he attempted to arrest in the House of Commons the five Members of Parliament." The second tablet bears an inscription stating that "it marks, with as much accuracy as can be attained, the place where Thomas Wentworth, Earl of Strafford, stood in this Hall during during the Impeachment for High Treason brought against him upon the accusation of the House of Commons before the House of Lords: 22nd March—29th April, A.D. 1640-1." For the site of this tablet direct evidence is not obtainable. The tablets, which were placed in position on Friday, have been located under the direction of Mr. J. T. Jones, the clerk of the works for the Houses of Parliament.

It is announced that for the present term of the Liverpool School of Architecture and Applied Arts, the number of students has doubled that of last term, the principal increase being in the decorative painting, architectural, and wood-carving classes. There are now 139 individual students in the school, making a total of 181 class entries. These are divided as follows:—Architectural, 37; sculpture and modelling, 46; decorative painting, 70; wood-carving, 21; wrought-iron work, 7. The students include architects, carvers in wood and stone, plasterers, furniture designers, joiners and carpenters, stained-glass draughtsmen, lithographers, smiths, &c.

The quarterly meeting of the council of the Auctioneers' Institute was held at the offices, 57 and 58, Chancery-lane, on Friday, the president, Mr. Frank Everill (Worcester) occupying the chair. Mr. John Hopper (Hopper and Sons), of Leeds, and Mr. Arthur Thompson (Thompson, Rippon, and Co.), of Exeter, were unanimously elected members of the council. A letter was read from a member of the institute offering a prize of £5 5s. for the best paper to be read upon some subject of interest to the profession, the competitors to be students of the institute, or pupils or clerks of Fellows. Two members of the council offered to give second and third prizes of £3 3s. and £2 2s. respectively. The offers were accepted with thanks. The election committee reported that the 34 applications for membership received since the last meeting had been separately considered. On the committee's recommendation 25 applicants were elected.

An additional outfall-sewer 9ft. diameter has been decided to be constructed between Old Ford and Barking; also the necessary bridges to carry another similar sewer, at an estimated cost of £450,000; an intercepting sewer from Paddington to Old Ford, at a cost of £245,000. These proposed sewers are for the relief of the main system, necessary owing to the increased population of these districts, which has exceeded the prospective population provided by Sir Joseph Bazalgette. The new sewers are required also to take the sewage of districts like Hornsey and Tottenham, and it is contemplated that West Ham, with its large population, will be brought into the main system. These additions to the sewerage system of the north of the Thames are being rendered absolutely necessary by the growth of this part of London, and the overcharging of the existing sewers.

A joint conference between the executive committee of the Association for the Promotion of Art and Music in the City of Glasgow, and the Corporation Galleries and Parks Committee has been held in the Municipal Buildings, at Glasgow, to consider the future of the New Art Galleries which are being erected in Kelvingrove Park. The proposal to erect these Galleries was carried in the town council in January, 1891, and the foundation of the buildings was completed several nths ago. Sir James King, on behalf of the ternational Exhibition Association, stated that surplus of the association amounted to £46,000, d that the association had undertaken to raise other £46,000 to carry out its objects—viz., the ection of the Galleries, a Museum, and, if found acticable, a School of Painting and Design. to the present the income of the association m all sources amounted to £127,901, and ucting a sum of £27,711 which had been ended on the foundation of the Galleries, re was left a balance of £108,190. Under the ginal agreement the town council resolved to ant a site on the association raising a sum of 6,000 in addition to the surplus. The associa- n, having fulfilled more than its part of the reement, was anxious that operations should be sumed at the Galleries. They were, Sir James id, in possession of tenders for erection and com- etion at £171,110 if equipped in the best style th without and within, and if completed in a ainer manner at £127,184, but not having a fficiency, had arranged this conference. There ere two alternatives left the corporation now: at they should decide whether they would accept e higher or the lower of the estimates quoted, d then decide whether they would advance the lance required to the Association to complete e building, or themselves take over the whole dertaking at the present stage, and complete it the name of the corporation. The members the Galleries Committee present promised to ve the statement made by Sir James on behalf the association their careful consideration.

FROM time to time various projects for the rmation of a pleasure resort at New Brighton, the site of the late Captain Molyneux's state, Rock Point, have been put forward, and scheme is now assuming a definite shape. The state is situated about 500 yards to the south of ew Brighton Pier, and is bounded on the east ide by the river Mersey. The promenade, which to be extended from the Magazines, Egremont, New Brighton, will give access to the grounds, nd the principal entrance will be from the new romenade, while an upper entrance will be pro- ided in Rowson-street. A syndicate, with a apital of over a quarter of a million, has been ormed for the purpose of acquiring the estate nd converting it into an extensive garden and leasure-ground. The principal feature is to be n Eiffel tower, such as has been erected at lackpool.

MR. W. R. GALBRAITH, the consulting engi- eer to the London and South-Western Railway ompany, presided on Friday at the award of ertificates won during the winter session of 1895 y students at the Crystal Palace School of Prac- ical Engineering. The number of students who have attended the lectures was 30; of these 27 were eligible for examination, and 18 passed. The examiners awarded a bronze medal to Mr. C. W. Wales, who had obtained during his course the necessary nine certificates, none of which was below third in the order of merit. Mr. Galbraith said many of the students before him were about to leave the school to enter upon the practical duties of their profession. They would enter the battle of life, he hoped, without misgiving, but still recognising that success would not be attained without effort. Forty-nine years ago, when he was young, railway engineering presented the best opening for a young man. Subsequently there came a period of gloom; but now the country was so covered with railways, that it was difficult to see where more could be made. Yet there were proposed a trunk line from South Wales to London, lines in the remote Highlands of Scotlands, and light railways for the relief of agricultural depression. Unfortunately, the number of students seeking to enter the profession was ever increasing. In 1847 the membership of the Institute of Civil Engineers was 600; in the present year it was 5,945, apart from the students' class of 787. He said this, not to discourage, but to stimulate them, for this would be assuredly an age of a survival of the fittest. Mr. J. W. Wilson, principal of the school, also addressed the students.

UNDER the auspices of the district council for Edinburgh and the East of Scotland of the National Registration of Plumbers, and in conjunction with the classes for plumbers in the Heriot-Watt College, Edinburgh, a lecture, illustrated by the exhibition of a new oil-blast lamp, was given on Dec. 19th by Mr. James Macdonald, R.P., on "Blowpipe Work." Principal F. Grant Ogilvie occupied the chair. Mr. Macdonald explained that the object he had in view in devising and constructing that lamp was to get a handy reliable tool which could be used for the various kinds of soldering and jointing in plumber-work, so as to overcome the difficulties entailed by the use of the chauffer, solder-pot, and irons, &c., all of which necessitated the use of coal. By means of that lamp he was now able to dispense with coal, chauffer, solder-pot, and irons. At this stage an exhibition of the practical use of the lamp was given by a number of workmen under the supervision of the lecturer. The lamps were lit and applied to the soldering of pipes, the whole work being done quickly. Proceeding, the lecturer said that plumber work had been entirely revolutionised within the last few years. Old methods and old forms of appliances were continually changing, and he was not aware that they had yet attained at perfection. His lamp was a little contribution on his part to simplify and cheapen the execution of plumber-work. He claimed that the lamp was a distinct labour-saving appliance, and the various processes of soldering could be executed with that appliance more economically than by some of the existing methods.

THE immense City Hall, which has been in course of erection for one-and-twenty years at Philadelphia, is at length practically completed. The building, the largest in the United States, covers four and a-half acres, without including the internal open courtyard, which is 200ft. square. It is erected of white marble, and is surrounded by a grand avenue, 135ft. wide on the eastern, western, and southern fronts, and 205ft. wide on the northern front. The dimensions are 470ft. from east to west, 486ft. 6in. from north to south. The structure contains 750 rooms, and is asserted to be absolutely fireproof and indestructible. Its cost has been over £5,000,000 sterling. On the north front of the building rises the lofty square tower, having at its summit four clock-faces, and above this an octagonal domical stage of ironwork supporting a platform and promenade, which are in turn surmounted by a statue of William Penn, heroic in proportions, and 36ft. 6in. in height. From the sidewalk to the crown of Penn's broad-brimmed hat the height is 547ft. 3½in. The work on the City Hall at Philadelphia was begun from plans by the late John McArthur, jun., whose design was selected in competition in 1869, and was carried out by his successor as city architect, Mr. John Ord. The iron tower which crowns the stonework is a remarkable piece of engineering, and makes the new City Hall of Philadelphia the highest building in the world with the exception of the Eiffel Tower (986ft.) and the Washington Monument (550ft.) An interesting feature of the ironwork of the tower is that it has been plated with aluminium, so that it will be protected from rust. We illustrated the Philadelphia City Hall by a perspective from the north-east, and plans of the princpal floors, in our issue of June 6, 1890.

GERICKE, the well-known German authority on forestry, states that the greatest ages to which trees in Germany are positively known to have lived are from 500 to 570 years. The pine, both in Bohemia and Norway and Sweden, has been known to endure to the latter age. Next comes the silver fir, which in the Bohemian forests has stood and thrived for upwards of 400 years. In Bavaria the larch has reached the age of 275 years. Of foliage trees, the oak appears to have survived the longest. The best example is the evergreen oak at Aschoffenburg, which reached the age of 410 years. Other oaks in Germany have lived to be from 315 to 320 years old. At Aschoffenburg the red beech has lived to the age of 245 years, and at other points to the age of 225 years. Of other trees, the highest known are ash, 170 years; birch, 160 to 200 years; aspen, 220 years; mountain maple, 225 years; elm, 130 years; and red alder, 145 years.

THE twenty-seventh annual and successive gathering of old broken-down citizens of Exeter, their wives, or widows, took place at the Luckie Horseshoe Studios in that city on Christmas Day. Seventy invited old people sat down to dinner, and did good justice to the joints, geese, plum-puddings, &c., that were successively placed before them. The Rev. S. W. E. Bird, M.A., rector of the parish (St. Sidwell), and honorary chaplain of the Luckie Horseshoe, as in years heretofore, acted as chief butler. Mr. Harry Hems himself, churchwarden of St. Sidwell's, occupied the chair, and Mr. Greville C. Hems the vice-chair. During the afternoon the chairman was supported by the Lord Bishop of Exeter (the Rev. E. H. Bickersteth, D.D.) and party from the Palace; the Right Worshipful the Mayor of Exeter (Alderman Pople), the Mayoress; the town clerk (Mr. G. R. Shorto), the under-sheriff (Mr. Councillor Gidley), and other representative people. Yesterday (Thursday) the girls of St. Martha's Orphanage (St. Sidwell's), and other children, to a like number—seventy—met at the Studios, and enjoyed tea; afterwards the youngsters had games, magic-lantern, dancing, &c.

IT is proposed to give a trial to the overhead electric system of tramway traction on the Nechells tramway route in Birmingham. There will be but a single line of wire. The present street lamp-pillars will be used for supports, and everything is to be done to reduce the objections which in some quarters have been urged against the system on the ground of unsightliness.

IN connection with the Glasgow Corporation series of Art lectures, Dr. Joseph Anderson, of the Antiquarian Museum, Edinburgh, gave a lecture on "Celtic Ornament," in the Corporation Galleries, Sauchiehall-street, Glasgow, on Saturday night. Dr. Anderson began with Celtic art in the Pagan time, and gave illustrations of its curvilinear system, after which he showed its development from the Pagan to the Christian period by the change from the geometrical to the symmetrical. The restricted scope of Pagan art, he said, was succeeded in Christian times by an almost unrestricted art, as Christianity brought in a number of new objects and aims. No people ever elaborated upon ornamentation as the Celts did. They could count on stone or other monuments, manuscripts, and other things three hundred varieties of pattern elaborated from the spiral and interlaced work. No nation had ever used fretwork as the Celts did. The merit of the Celtic ornamentation was that in other manuscripts where ornament was inserted it was done to illustrate the subject, while the Celt had only his letters to deal with, and never attempted to illustrate the subject. He could not do it. His art had limitations. The Celt put an individuality into everything he did. After giving religious illustrations, in the form of manuscripts, croziers, and bells, secular specimens of work were next shown in the form of sword scabbards, flintlock handles, and brooches—Irish and Scottish. Sculpture work was also illustrated. In copying Celtic jewelry, modern jewellers, he said, failed because they did not work out the Celtic principle: they only imitated the form. The Celtic style of ornament that he had shown them was a style that had lasted for 2,000 years. It began two centuries before the Romans came to these islands. It lived through all the changes of the Pagan time, through all the changes of the Christian time, and through all the changes of the Reformation. It lived till the other day. The Four Georges killed it out. Yet here was an organic production that grew in our own islands 2,000 years ago; that had lived all that time; that was only killed out by the extinction of the national feeling of the people. How could they revive it? They could not; but there were elements in it which they could make use of. They were their racial inheritance; and if there was anyone present who had a genius for decoration, if he chose, the whole field was open to him.

A METHOD of rendering water potable is said to have been devised by M. Allain, of Marseilles, who uses iodine in the proportion of one part in 100,000 to destroy bacilli, and then, after an interval of about twenty minutes, the free iodine is neutralised with sodium hyposulphite, and the water is filtered through animal charcoal or in the ordinary way. If the water is not very impure, this filtering is not necessary. It is stated that the water treated with iodine in this manner is colourless, odourless, and tasteless.

New buildings are about to be erected at Truro for the high school for girls, on a site on the Falmouth-road. Mr. E. R. Robson, F.S.A., of Westminster, is the architect, and the cost is estimated at £4,000.

At a special meeting of the Douglas Town Commissioners on Wednesday week, it was decided to increase the width of the marine promenade, now in course of construction along the crescent between the Queen's Promenade to the Iron Pier, from 70ft. to 80ft.

CHIPS.

The sudden death is announced of Mr. T. S. Weeks, C.E., waterworks engineer to the corporation of Torquay, at the age of 57 years.

The Ealing and South Harrow Railway Company, which was last year incorporated for the purpose of constructing a railway between Ealing and South Harrow, have deposited a Bill seeking powers to extend their authorised railway from Harrow-on-the-Hill to Uxbridge and Beaconsfield, the total length of the proposed extension being a little over 16 miles.

The executive committee of the Dean Payne Smith Memorial Committee have resolved that the memorial in the cathedral shall take the form of a pulpit in the nave for use on the occasion of special services there.

The Great Hall of the Church House at Westminster will be opened on February 11 by the Duke of York. Sir Arthur W. Blomfield, A.R.A., and Son, are the architects.

The reports as to the turnover in the real estate market throughout the West Riding for the year now closing are highly satisfactory, and no indication whatever appears of anything adverse to its well-being in the coming year. Throughout the urban districts of the West Riding a larger amount of property has been dealt with by auction and by private contract than in 1894, and the percentage of sales effected has been considerably increased.

The city council of Glasgow received on Friday a report from a committee stating that tenders had been opened for the erection of new tenements in Stobcross, Cheapside, and Piccadilly-streets, Anderston; but in consequence of a difference of over £1,000 between the estimated cost (£5,571) and the cumulo amount of the lowest tenders (£6,639), the committee delayed consideration of the tenders, and remitted to the city engineer to consider whether any modifications could be made upon the specifications in order to bring the actual cost of the buildings as near as possible to the estimated cost.

The Rev. Lord Victor Seymour was the preacher on Sunday at the opening of the church of St. Augustine. Archway-road, Highgate. The first portion of the building was consecrated in 1888, and the total cost up to the present has been over £10,000, of which £1,500 has still to be raised.

A new Conservative club is about to be erected at Darlaston, at a cost of £800. The plans have been prepared by Mr. Henry E. Farmer, architect, of Bank Chambers, Wednesbury and Darlaston.

A new pulpit of carved oak, and Perpendicular in style, has been placed in the parish church of St. Cleer, near Liskeard. Messrs. Harry Hems and Sons, of Exeter, executed the work.

At the suggestion of the Duchess of Abercorn, a committee has been formed in the city of Londonderry for the purpose of erecting almshouses as a memorial of the late Mrs. Alexander ("C. F. A."), the well-known hymn-writer, and late wife of the present Bishop of Derry.

Various improvements are being carried out at the Philharmonic Hall at Southampton, including the erection of a new portico. Mr. W. Burrough Hill is the architect, and Mr. Sydney Nicholls, the builder.

The city council of Aberdeen have instructed their burgh surveyor, Mr. Dyack, to prepare plans for a fire-brigade station and police workshops to be erected in King-street.

At the Liverpool Chancery Court, on Friday, Vice-Chancellor Hall gave judgment in regard to an action brought by Mr. Willis, a property owner, to prevent the Whiston District Authority pulling down a fence that he had erected to inclose a strip of land belonging to him. The local authority claimed that the land in question had been dedicated to the public, and the Vice-Chancellor, arriving at the same opinion, dismissed the plaintiff's action with costs.

A museum of antiquarian, natural history, and technical objects has been opened this week at St. Alban's. A strong committee and three honorary secretaries have been appointed, and the nucleus of a collection is on view in two rooms on the first floor of premises in the Market-place.

For the ensuing session of Parliament 199 private Bills have been deposited, as against 170 last year.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some of their patent Manchester grates to the new Cotton Exchange, Liverpool.

A public meeting is to be held at Salisbury on January 28th to consider what steps can be taken to secure the safety of the tower and spire of the cathedral. On a report by Sir Arthur W. Blomfield, A.R.A., a sum of £4,000 has been subscribed out of £5,000 then considered necessary to strengthen the spire, but on further examination Sir Arthur believes that at least £10,000 must be expended on the urgent works.

The city council of Leeds have abandoned the proposal for the extension of the city boundaries by the inclusion of Holbeck and Hunslet.

The parish church of Little Gaddesden, Herts, after having been closed for internal and structural alterations, has been reopened. The reopening service took the form of dedication of the various memorials of the late rector, the Rev. C. G. Lane, including sanctuary floor, chancel lamps, two memorial windows at the south and west corner of the church, designed and executed by Mr. C. E. Kempe, of London. The work in connection with the new heating apparatus for the church was carried out by men of the Asbridge Estate Office, under the direction of Mr. J. Wright, the clerk of the works.

Mr. W. Lloyd Jones, architect, of Bangor, has been elected on the school board of that city.

At Eccleshill, on Friday, Colonel Luard, of the Local Government Board, held an inquiry with regard to the district council's application for sanction to borrow £2,000 for private street improvements. There was no opposition.

Three marble tablets, erected in Hawarden Church by parishioners in memory of the ten years' ministry in the parish as curate of the Rev. Harry Drew, were unveiled on Christmas Eve. The tablets are a record of the names of the rectors of Hawarden and the date of induction to the living, compiled by the late Mr. W. H. Gladstone, and revised by the Rev Dr. J. Charles Cox, F.S A, from the records of Lichfield Cathedral and those in the British Museum.

The town-hall at Ashbourn, Derbyshire, which was built 34 years ago, has just been reconstructed and improved. Mr. Sugden, of Leek, was the architect for the alterations, which have been carried out by Messrs. R. and H. Gratton.

A three-manual organ, which has just been built in St. Michael's Parish Church, North Merchiston, Edinburgh, by Messrs. Brindley and Foster, Sheffield, was inaugurated on Wednesday week.

The Ormskirk Rural District Council propose to borrow £8,350 for works of water supply for Tarleton and Hesketh-with-Becconsall—two considerable parishes between Southport and Preston.

The National Theatre in Buenos Ayres has been completely destroyed by fire.

Field-Marshal Viscount Wolseley visited Norwich on Thursday in last week for the purpose of formally opening the new Soldiers' and Sailors' Home, which has been established by public subscription in that city. The cost of converting and furnishing the home, which was previously used for manufacturing purposes, has been about £1,700.

The foundation stone of a new Wesleyan chapel was laid last week at Golant, near Fowey. Mr. F. Jury, of St. Austell, is the architect, and Mr. J. Rundell, of Tywardreath, is the contractor. The chapel is to seat 120 people.

A first meeting of the creditors of Mr. James Price, builder, of Ilfracombe, was held on Dec. 19. The Official Receiver (Mr. G. Phillpott) presided. The gross liabilities are put down at £6,905 6s. 10d., of which £1,022 is expected to rank for dividend. A committee was appointed.

A new co-operative store is about to be built at Skelmanthorpe, at a cost of £1,000, from designs by Mr. J. Berry, architect, of Huddersfield, by whom plans are also now being prepared for a Primitive Methodist chapel at Kirkburton.

A new tower and spire have just been added to Clive parish church, Salop, at the sole cost of Mr. J. J. Bibby, as a memorial to his late wife. The style adopted is Decorated, and the works are carried out in stone.

The Department of Science and Art has received through the Foreign office a despatch from the German Ambassador at this Court, calling attention to an International Art Exhibition proposed to be held at Dresden in May—October, 1897, to consist of collections of works from different countries, and to comprise works of painting, sculpture, and architecture, and of the delineating and multiplying arts, which have been produced during the last ten years.

The Baptists of Golcar have decided to build a new Sunday-school on the central-hall plan, to provide accommodation for 600 scholars. Mr. Berry, of Huddersfield, is the architect.

120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Bethnal Green.—For fixing sliding partitions at the Wolverley-street School, Bethnal Green, for the London School Board:—

Munday, G., and Sons	£376	0	0
Gibbs, D, and Co.	369	0	0
Staines and Son	297	0	0
Martin, W.	290	0	0
White, T., and Son, Fairfield-road, Bow (accepted)	266	0	0

Battersea, S.W.—For improving the efficiency of the existing low-pressure hot-water apparatus at the Latchmere School, Battersea Park-road, for the London School Board:—

May, J. and F....	£161	0	0
Davis, G.	159	0	0
Ellis, J. C. and J. S., Limited ...	152	10	0
Wontner-Smith, Gray and Co. ...	151	10	0
Purcell and Nobbs	143	0	0
Clarke, J. F., and Sons	140	0	0
Fraser, J., and Son	116	0	0
Duffield and Co., Slough (accepted)	112	0	0

Bristol.—For the formation of road and sewers, Barton Hill, Bristol, for Mr. D. Johnstone. Mr. W. Cloutman, Corn-street, Bristol, surveyor. Quantities supplied:—

Wilkins	£419	0	0
Durnford	385	0	0
Mangotsfield Stone Company ...	360	0	0
Bryant and Price	326	0	0
Slade	309	10	0
Krauss	309	0	0
Martin	285	0	9
Beaven	285	0	0
Thatcher	279	9	0
Lovell	249	13	5
Thomas and Webb	232	0	0
Jones (accepted)	228	0	0

Surveyor's estimate, £250.

Brixton, S.W.—For the provision of a manual training centre in connection with the Lyham-road school, Brixton, for the London School Board:—

Downs, W.	£1,496	0	0
Holliday and Greenwood	1,466	0	0
Whitehead, L., and Co.	1,430	0	0
Akers, W., and Co.	1,429	0	0
Bowyer, J. and C.	1,336	0	0
Garrett, J., and Son	1,328	11	0
Peacock Bros.	1,280	11	0
Triggs, E, Clapham (accepted) ...	1,272	12	6

[(*a*) Cost of tar-pavement and drainage to additional land, £101; (*b*) boundary walls, £163; (*c*) manual training centre, £803 12s. 6d.; (*d*) works on site, £160; (*e*) extra depth of foundations, £45; total, £1,272 12s. 6d.]

Clerkenwell.—For structural alterations to the school in Bowling Green-lane, Clerkenwell (which provides accommodation for 813 children, was erected in the year 1875, and was enlarged in 1881), for the London School Board:—

Cox, C.	£1,986	0	0
Dearing, C., and Son	1,878	0	0
Staines and Son	1,877	0	0
Roberts, L. H., and R.	1,827	0	0
Yerbury, R. A., and Sons	1,800	0	0
Munday, G., and Sons, Trinity-square, E.C. (accepted)	1,630	0	0

Clerkenwell.—For structural alterations in connection with the infants' department of the York-road School, King's-cross, for the London School Board:—

Dearing, C., and Son...	£239	0	0
McCormick and Sons...	226	0	0
Ballard, W. T.	222	5	0
Cruwys, T.	210	0	0
Stevens Bros.	203	10	0
Britton, F., Highbury	202	0	0
